**I. INTRODUCTION & QUALIFICATIONS**

**Q. Please state your name, title, and business address. By whom are you employed and in what capacity?**

A. My name is Simi Rose George. I am Manager, Natural Gas Distribution Regulation, in the U.S. Climate and Energy Program at Environmental Defense Fund (“EDF”). My business address is 123 Mission Street, San Francisco, California, 94105.

**Q. On whose behalf are you submitting testimony in this proceeding?**

A. I am submitting this testimony on behalf of EDF.

**Q. Please provide a summary of your education and experience.**

A. I hold a master’s degree in Public Administration/International Development from the John F. Kennedy School of Government, Harvard University, and a law degree from the National Law School of India University. I have been employed at EDF since 2014. At EDF, I manage several initiatives demonstrating the benefits of, and creating pathways for the adoption of, new and beneficial technologies providing data and analytics for the purpose of enhancing the design and implementation of gas distribution system modernization efforts. Prior to joining EDF, I worked with the London offices of two international law firms, Linklaters LLP and Clifford Chance LLP. At both firms, I advised multinational clients on cross-border investments and other projects, with an emphasis on the energy and infrastructure sectors. My resume is included as Exhibit 1.

**II. SUMMARY, PURPOSE & SCOPE OF TESTIMONY**

**Q. Please provide a summary of your testimony.**

A. The system modernization and maintenance efforts proposed by The Brooklyn Union Gas Company d/b/a National Grid NY (“KEDNY”) and KeySpan Gas East Corporation d/b/a National Grid (“KEDLI”) (together, “National Grid” or “the Companies”) in order to enhance the reliability and integrity of their distribution systems are necessary and appropriate.

1           Sophisticated technologies allowing for the collection of previously unavailable data on  
2           utility asset conditions have emerged. Gas utilities such as KEDLI and KEDNY now have the  
3           opportunity to enhance the capital efficiency of their system modernization and maintenance  
4           efforts by leveraging such data and analytics. Specifically, the design and implementation of the  
5           Companies' pipe replacement and leak repair programs can be advanced using newly available,  
6           spatially attributed leak flow rate data gathered through advanced leak detection and leak  
7           quantification methods. National Grid and EDF are collaborating on a suite of pilot projects in  
8           CY 2016 and beyond demonstrating the potential to enhance the Companies' leak repair and pipe  
9           replacement efforts using such data.

10           Among other things, a new leak survey methodology incorporating the use of advanced  
11           mobile leak detection and leak quantification being piloted by EDF will provide National Grid  
12           with detailed information on the relative leakiness of its mains and advance the Companies'  
13           efforts to implement their leak repair and pipe replacement programs as effectively as possible.  
14           EDF and National Grid are also collaborating to more accurately quantify the methane emissions  
15           reduction impacts associated with new technologies pioneered by National Grid (e.g., Cast Iron  
16           Joint Sealing Robot ("CISBOT")) in order to derive a more accurate understanding of their  
17           benefits.

18           From a longer term perspective, EDF and National Grid will collaboratively explore the  
19           scope to build on and enhance the Companies' existing hazard ranking algorithm using leak flow  
20           rate data. These efforts seek to enhance the foundational basis of National Grid's system  
21           modernization and maintenance efforts.

22           It is anticipated that these pilot projects will create pathways for the integration of the  
23           underlying advanced leak detection and quantification methods into regular utility operations, and  
24           thereby help optimize ratepayer, environmental and system-wide outcomes.

25           The consideration of spatially attributed leak flow rate data has broader benefits  
26           extending to the regulatory assessment of the need for, and design of, such projects. This

1 Commission and its counterparts across the country are called on to balance customer costs and  
2 interests with the need for pipe replacement and leak abatement. The absence of granular  
3 information on asset conditions, particularly the relative leakiness of underground mains,  
4 complicates the tasks of assessing the extent of need and overseeing programs once approved. As  
5 explained in further detail below, commercially available advanced leak detection and  
6 quantification methods provide data and perspective around underground infrastructure  
7 conditions, leakiness, program need and program design, and can serve as tools for this  
8 Commission and other regulatory entities to better balance need with cost.

9 **Q. Are you providing any appendices or attachments to your testimony?**

10 A. Yes, I have the following exhibits.

11 Exhibit 1: Resume of Simi Rose George

12 Exhibit 2: Sample leak map reflecting spatially attributed leak flow rate data

13 **Q. What is the purpose and scope of your testimony?**

14 A. The purpose of my testimony is to comment on the Companies' proposed accelerated pipe  
15 replacement, enhanced leak surveillance and leak repair efforts, and the potential benefits to  
16 customers, and the environment associated with the use of new technological solutions (including  
17 advanced leak detection and leak quantification methods) in designing and implementing leak  
18 repair and pipe replacement activities. My testimony also discusses the broader benefits of using  
19 data gathered using these new methodologies from a regulatory perspective, i.e., to assess the  
20 extent to which pipe replacement and/or leak repair efforts are needed, achieve the optimal  
21 balance between ratepayer interests and the need for system modernization efforts, and improve  
22 utility project implementation. In this vein, I outline a suite of projects that National Grid and  
23 EDF have agreed to collaborate on, in order to advance the use of new technologies to better  
24 execute National Grid's system modernization and maintenance efforts.

26

1 **III. THE COMPANIES' PROPOSED ACCELERATED PIPE REPLACEMENT AND LEAK**  
2 **REPAIR EFFORTS**

3 **Q. Please summarize your understanding of the Companies' proposed Pipeline Integrity and**  
4 **Reliability Programs, and other proposed initiatives to minimize leaks and improve system**  
5 **integrity and reliability.**

6 A. The Companies propose a Gas Safety and Reliability Surcharge to accelerate their leak prone pipe  
7 ("LPP") replacement efforts. Both Companies propose to significantly increase their rate of  
8 removal of LPP in the Rate Year and Data Years. It is proposed that KEDNY will replace at least  
9 50 miles per year and KEDLI will replace at least 115 miles per year.<sup>1</sup> For KEDNY, this  
10 represents a 100 percent increase over its 2012 target, and for KEDLI, its new pipe replacement  
11 target represents a 130 percent increase over its 2014 target.<sup>2</sup> In addition, National Grid proposes  
12 an incentive mechanism to fund increases in LPP replacement going beyond the proposed annual  
13 baseline targets by more than five and 20 miles respectively.<sup>3</sup> National Grid notes that if these  
14 incentive targets are achieved, the Companies would eliminate all LPP on their systems within 20  
15 years.<sup>4</sup>

16 In addition, over a three-year period starting with the Rate Year, the Companies propose  
17 to reduce their backlog of non-hazardous leaks annually by an average of 100 and 500 leaks,  
18 respectively, with a view to enhancing system performance and reducing methane emissions,  
19 thereby benefiting ratepayers, the environment and the system as a whole.<sup>5</sup> National Grid  
20 proposes to use the Gas Reliability and Safety Surcharge to fund the repair of leaks beyond the  
21 above baseline targets based on their respective average leak repair costs, subject to a total cap of  
22 50 additional leaks per year.<sup>6</sup> Further, the Companies are proposing additional leak surveillance

<sup>2</sup> *Ibid*, at p. 28.

<sup>3</sup> Testimony of Kenneth D. Daly, Book 1, at p. 40.

<sup>4</sup> *Id*.

<sup>5</sup> Testimony of the Gas Safety Panel, Book 6, at p. 46.

<sup>6</sup> *Ibid*, at p. 50.

1 activities, and targets for reducing their hazardous leaks, keeping in mind the greater safety risks  
2 associated with these leaks.<sup>7</sup>

3 Recognizing that system modernization needs must be balanced with ratepayer interests,  
4 National Grid proposes to utilize technology that will extend the life of LPP until they can be  
5 replaced. These technologies include CISBOT, a robot which seals joints in large diameter leak  
6 prone mains at lower cost than traditional joint sealing, and cured in place (“CIP”) lining, which  
7 can increase the longevity of LPP until it is replaced.<sup>8</sup>

8 **Q. WHAT IS YOUR ASSESSMENT OF THE LEAK-PRONENESS OF NATIONAL GRID’S**  
9 **DISTRIBUTION SYSTEM?**

10 A. The Companies operate systems with relatively high levels of LPP - nearly half of the mains on  
11 both systems are leak-prone.<sup>9</sup> Cast iron and unprotected steel, which constitute a significant  
12 proportion of the LPP on both companies’ systems, are known to be “high-risk” pipe.<sup>10</sup> In view of  
13 these risks, PHMSA introduced requirements in the early 1970s requiring buried or submerged  
14 steel pipeline to be protected against external corrosion. Because these requirements do not apply  
15 to pipelines installed pre-1971, they continue to corrode and must therefore be replaced.<sup>11</sup>

16 The positive correlation between aging, corrosion-prone gas infrastructure and leak rate,  
17 identified in EDF’s analysis of data gathered through its survey of leaks on utility systems across  
18 the country, which is described in Dr. Joseph von Fischer’s testimony, is reflected in the  
19 Companies’ distribution systems. For instance, the current leak rate for all distribution pipes on  
20 KEDLI’s system is 0.13 leaks per mile, whereas the corresponding figure for LPP is more than

---

<sup>7</sup> Testimony of the Gas Safety Panel, Book 6, at p. 46.

<sup>8</sup> Testimony of the Gas Infrastructure and Operations Panel, Book 4 – KEDLI, at p. 32.

<sup>9</sup> *Ibid*, at p. 20.

<sup>10</sup> For instance, PHMSA has recognized the heightened risk of failure associated with cast iron pipelines, on account of the degrading nature of iron alloys, age of such pipelines and pipe joint design. Relative to unprotected steel, cast iron is more susceptible to main breaks leading to the leakage of large volumes of gas, whereas unprotected steel is more likely to develop slow leaks that can be detected over time. See generally Pennsylvania PUC Staff Report, “Inquiry into Philadelphia Gas Works’ Pipeline Replacement Program”, April 21, 2015, (“PUC Staff Report”), available at [http://www.puc.pa.gov/NaturalGas/pdf/PGW\\_Staff\\_Report\\_042115.pdf](http://www.puc.pa.gov/NaturalGas/pdf/PGW_Staff_Report_042115.pdf), at p. 15-16.

<sup>11</sup> *Id.*

1 double that figure, at 0.28 leaks per mile.<sup>12</sup> Further, KEDLI has observed a recent upward trend in  
2 the LPP leak rate as these facilities continue to age and deteriorate.<sup>13</sup> Thus, the challenges  
3 associated with LPP are becoming more pressing as the Companies' distribution systems continue  
4 to age. This is not only a public safety issue, as recognized by the Companies,<sup>14</sup> but also an  
5 important economic issue, given the large volumes of natural gas being released into the  
6 atmosphere, the costs of which are borne by ratepayers. Additionally, this is an environmental  
7 challenge because methane, the primary constituent of natural gas, is a potent greenhouse gas,  
8 more than 84 times more potent than carbon dioxide over a 20-year timeframe.

9 **Q. PLEASE COMMENT ON THE COMPANIES' PIPELINE REPLACEMENT EFFORTS.**

10 A. Through their proposed accelerated replacement efforts, the Companies expect to eliminate all  
11 LPP on their systems in 20 years.<sup>15</sup> Along with Pennsylvania, New York has the highest  
12 percentage of highly leak-prone mains (i.e., cast iron and unprotected steel) on its distribution  
13 system. In all, the state as a whole has over 11,000 miles of such mains, second only to  
14 Pennsylvania by a small margin.<sup>16</sup>

15 The Companies' proposed accelerated pipe replacement efforts are necessary and  
16 appropriate. These efforts not only advance the Commission's stated goal of replacing all LPP in  
17 New York in the next 20 years<sup>17</sup>, but are also consistent with the stand adopted by key federal  
18 agencies on the issue of aging natural gas pipeline infrastructure. For instance, in 2011, the U.S.  
19 Department of Transportation ("DOT") and the Pipeline and Hazardous Materials Safety  
20 Administration ("PHMSA") jointly issued a Call to Action to accelerate the repair and

<sup>13</sup> *Id.*

<sup>14</sup> Testimony of Kenneth D. Daly, Book 1, at p. 40.

<sup>15</sup> *Ibid.*, at p. 44.

<sup>16</sup> Department of Energy, "Quadrennial Energy Review: Energy Transmission, Storage, And Distribution Infrastructure", April 2015, "QER", at p. 2-21, available at <http://energy.gov/epsa/downloads/quadrennial-energy-review-full-report>,

<sup>17</sup> Case 15-G-0151.

1 replacement of cast iron and bare steel pipelines. According to PHMSA, 16 states have  
2 completely eliminated cast or wrought iron natural gas distribution lines within their borders.<sup>18</sup>

3 There are significant public safety, ratepayer and environmental benefits to be gained  
4 from thoughtfully designed, economically efficient, and well-executed pipeline replacement  
5 projects. These benefits are widely recognized by key stakeholders. For example, as noted by the  
6 U.S. Department of Energy in the Quadrennial Energy Review (“QER”) released in August 2015,  
7 the replacement of leak-prone pipelines enhances safety by reducing the risk of main breaks and  
8 pipe failure, and reduces harmful methane emissions.<sup>19</sup> Additionally, as the costs of leaked gas  
9 are borne by ratepayers, pipeline replacement programs advance ratepayers’ interests by reducing  
10 the amount of natural gas leaked into the atmosphere and reducing future leak maintenance and  
11 repair costs.

12 **IV. DESIGN AND IMPLEMENTATION OF THE COMPANIES’ PIPE REPLACEMENT**  
13 **AND LEAK REPAIR EFFORTS**

14  
15 **Q. Please explain relevant aspects of the prevailing utility and regulatory context as it relates to**  
16 **the use of advanced leak detection technology and leak quantification methods by utilities.**

17 **A. Utility context:** Since the 2011 PHMSA/DOT Call to Action to accelerate the repair,  
18 rehabilitation, and replacement of the highest-risk pipeline infrastructure, sophisticated  
19 technologies allowing for the collection of previously unavailable data on utility asset conditions  
20 have emerged. Utilities can employ such data to supplement existing information on asset risks,  
21 and thereby design and target system modernization and maintenance efforts more effectively. As  
22 discussed in further detail below, utilities are beginning to leverage such data and analytics to  
23 enhance system integrity and capital efficiency.

---

<sup>18</sup> These states are: Alaska, Arizona, Hawaii, Idaho, Montana, North Carolina, North Dakota, New Mexico, Nevada, Oklahoma, Oregon, South Carolina, Utah, Vermont, Wisconsin and Wyoming. See generally, PUC Staff Report, at p. 33.

<sup>19</sup> QER, *supra*, at p. 2-18.

1 Gas utilities are beginning to move beyond regulatory compliance towards proactive  
2 asset risk and integrity management in response to a number of factors, including regulatory  
3 advancements, and an increased focus on pipeline safety.<sup>20</sup>

4 Advanced leak detection and quantification methods have significant ratepayer,  
5 environmental and system-wide benefits. In order to demonstrate these benefits and create  
6 pathways for the adoption of such advanced technologies by utilities, EDF has engaged with a  
7 number of major utilities including Public Service Gas and Electric (“PSE&G”), New Jersey’s  
8 oldest and largest utility as well as Consolidated Edison (“Con Edison”) and National Grid in  
9 New York, as described in further detail below.

10 Broadly speaking, utilities are not yet routinely using leak flow rate (i.e. the volume of  
11 methane emissions released from a given leak over time) to prioritize their leak abatement or  
12 pipeline replacement activities but several are beginning to explore the use of leak quantification  
13 methods. Following its 2013 rate case, Con Edison and other rate case participants, including  
14 state and city agencies as well as EDF and other NGOs formed a collaborative to consider  
15 methane leak reduction opportunities. This collaborative has since developed a project to test leak  
16 quantification methods, with the objective of identifying a method for the quantification of leaks  
17 on Con Edison’s system to facilitate the prioritization of such leaks for repair using leak flow  
18 rate, in conjunction with other factors. NYSEARCH, a research, development and demonstration  
19 organization serving gas utility member companies, and other utilities, including National Grid,  
20 have since joined the effort. As part of this initiative, EDF and Con Edison recently entered into a  
21 collaborative pilot project to quantify gas leaked from Con Edison’s Type 3 leak backlog and  
22 develop a prioritization scheme for the repair of those leaks.<sup>21</sup> Similarly, in California, Pacific

<sup>20</sup> PricewaterhouseCoopers, “A new view on pipeline risks: How spatial analytics can empower asset management for gas utility companies”, April 2016, available at [https://www.pwc.com/us/en/power-and-utilities/publications/assets/pwc\\_gas\\_pipeline\\_spatial\\_analytics\\_april\\_2016.pdf](https://www.pwc.com/us/en/power-and-utilities/publications/assets/pwc_gas_pipeline_spatial_analytics_april_2016.pdf).

<sup>21</sup> <http://www.coned.com/newsroom/news/pr20141217.asp>

1 Gas & Electric Co. (“PG&E”) is exploring the integration of leak quantification technology into  
2 its leak management efforts.<sup>22</sup>

3 Similar to other major utilities, the Companies use a risk ranking algorithm to prioritize  
4 LPP replacement. This algorithm calculates a relative risk score for each LPP segment using  
5 various factors – this score along with an assessment of other factors and risks is the basis on  
6 which the Companies prioritize LPP replacement.<sup>23</sup>

7 **Regulatory/Policy context:** Under federal rules establishing integrity management requirements  
8 for gas distribution pipeline systems (the “Distribution Integrity Management Program for  
9 Natural Gas Distribution Sector” or “DIMP”), operators are required to develop and implement a  
10 distribution integrity management program. While the rules do not explicitly require utilities to  
11 quantify leaks, they state that (a) pipeline operators must consider all reasonably available  
12 information to identify threats to pipeline integrity and (b) the number and severity of leaks can  
13 be important information in evaluating the risk posed by a pipeline in a given location. Under the  
14 rules, operators are required to consider the following categories of threats to each gas  
15 distribution pipeline: corrosion, natural forces, excavation damage, other outside force damage,  
16 material or welds, equipment failure, incorrect operations, and other concerns that could threaten  
17 the integrity of its pipeline. Sources of data may include, but importantly, are not limited to,  
18 incident and leak history, corrosion control records, continuing surveillance records, patrolling  
19 records, maintenance history, and excavation damage experience.

20 With technology evolving to make leak quantification methods commercially available  
21 and viable, and PHMSA rules requiring operators to consider all relevant data points in  
22 identifying threats to pipeline integrity, it is clear that the prevailing regulatory framework not

<sup>23</sup> Testimony of the Gas Infrastructure & Operations Panel, Book 4 – KEDLI, at p. 55.

1 only allows for newly available data such as spatially referenced leak flow rate data to be  
2 considered in evaluating threats to pipeline integrity, but in fact, underscores the need to do so.

3 **V. BENEFITS OF INTEGRATING ADVANCED LEAK DETECTION AND LEAK**  
4 **QUANTIFICATION METHODS INTO UTILITY LEAK REPAIR AND PIPE**  
5 **REPLACEMENT PROJECTS**

6  
7 **Q. Please provide an overview of EDF's engagement with utilities on the integration of**  
8 **advanced leak detection technology and leak quantification methodology into utilities' pipe**  
9 **replacement and leak repair programs.**

10 A. In collaboration with Google Earth Outreach, Colorado State University ("CSU"), and various  
11 natural gas utilities, EDF is managing a project that uses Google Street View cars equipped with  
12 Picarro methane concentration analyzers to quantify methane leaks from distribution pipelines.  
13 The goals of this project are to demonstrate the benefits of state-of-the-art technological solutions,  
14 create pathways for the integration of leak quantification and advanced leak detection technology  
15 into utility operations, and to enhance transparency with respect to utilities' leak abatement  
16 efforts by publishing online maps showing the location and size of leaks in utilities' distribution  
17 systems. These maps have been referenced in several reports and presentations, including for  
18 instance, the U.S. Department of Energy's ("DOE") QER, which was released in April 2015.<sup>24</sup>  
19 Further explanation of the methodological approach and scientific research underpinning this  
20 project is contained in Dr. Joseph von Fischer's written testimony.

21 Last year, New Jersey's oldest and largest utility, PSE&G, and EDF engaged on a  
22 collaborative pilot project in the context of PSE&G's proposed accelerated pipe replacement  
23 program demonstrating how leak flow rate data can be used as a valuable layer of data, in  
24 conjunction with asset risk assessments generated using hazard ranking algorithms/models, to the  
25 benefit of utilities, customers and the environment. EDF gathered leak flow rate data for sections

---

<sup>24</sup> Department of Energy, "Quadrennial Energy Review: Energy Transmission, Storage, And Distribution Infrastructure", April 2015, "QER", available at <http://energy.gov/epsa/downloads/quadrennial-energy-review-full-report>. EDF's methane leak maps are referenced at p. 2-20.

1 of PSE&G's infrastructure targeted for replacement through a mobile leak survey using Google  
2 Street View cars that were specially outfitted with methane sensors. PSE&G shared information  
3 with EDF on the location and type of its pipelines, enabling the collection of leak flow rate data  
4 that could be spatially-attributed to specific pipes targeted for replacement.

5 In November 2015, the New Jersey Board of Public Utilities ("BPU") approved a  
6 settlement agreement among PSE&G, EDF and other stakeholders relating to a proceeding  
7 initiated by PSE&G, in which it sought approval for an accelerated pipe replacement program.<sup>25</sup>  
8 As part of this settlement, PSE&G received BPU approval to implement a \$905 million pipe  
9 replacement program over a three-year time frame. Under the terms of this settlement, after  
10 taking into account safety considerations, PSE&G is required to consider data gathered by EDF  
11 on the volume of methane emissions leaked from its pipes, in conjunction with other relevant  
12 factors to identify those that are most in need of replacement. PSE&G has already started using  
13 this dataset in prioritizing its pipeline replacement efforts.<sup>26</sup>

14 Other utilities across the country are exploring the integration of this new and beneficial  
15 methodological approach into their leak operations. For instance, Con Edison and EDF recently  
16 entered into a collaborative arrangement to develop a program to prioritize the repair of non-  
17 hazardous Type 3 leaks on Con Edison's system. Under this program, researchers from CSU plan  
18 to survey over 300 leaks constituting Con Edison's Type 3 leak backlog, and characterize these  
19 leaks into "small," "medium," and "large" emitters. In order to facilitate this survey, Con Edison  
20 has provided EDF with location information for its Type 3 leak backlog, including information on  
21 underground infrastructure locations, under the terms of a non-disclosure agreement. Con Edison  
22 will prioritize the repair of a specified percentage of these Type 3 leaks classified based on

<sup>25</sup> Decision and Order of the New Jersey Board of Public Utilities In The Matter Of Public Service Electric And Gas Company for Approval of a Gas System Modernization Program and Associated Cost Recovery Mechanism, November 16, 2016, available at <http://www.nj.gov/bpu/pdf/boardorders/2015/20151120/11-16-15-2F.pdf>.

<sup>26</sup> T. Johnson, "Utilities must reduce methane leaks from natural gas pipelines, says new bill", February 5, 2016, available at <http://www.njspotlight.com/stories/16/02/04/utilities-must-clamp-down-on-methane-leaks-from-natural-gas-pipelines-says-new-bill/>.

1 emissions flow rate and/or leaks totaling a specified percentage of emissions – this specified  
2 percentage will be determined by Con Edison in consultation with relevant stakeholders.

3 **Q. How can data gathered using advanced leak detection and quantification methods assist the**  
4 **Commission and National Grid in assessing the extent of need for, and benefits from,**  
5 **proposed system modernization and leak abatement projects?**

6 A. Along with other state public utility commissions around the country, this Commission is tasked  
7 with the challenge of balancing ratepayer interests in keeping natural gas rates stable and  
8 affordable, and utility and broader public safety interests in addressing gas infrastructure  
9 modernization and maintenance needs. The evaluation of proposed pipeline replacement  
10 programs by state regulatory entities necessitates a robust cost-benefit analysis, requiring careful  
11 scrutiny of all available information.

12 New data such as that made available through commercially available state-of-the-art  
13 leak detection and leak quantification methods can assist utilities and the Commission in  
14 addressing this challenge by offering more granular and detailed information on the leakiness of  
15 natural gas systems than has ever been previously available. Spatially-attributed leak data  
16 developed by connecting leak flow rates with information on the nature and location of the  
17 associated utility infrastructure can aid in effective and transparent decision making, offering  
18 significant benefits to utilities and regulatory agencies. For instance, such data can help  
19 characterize the condition of pipeline systems, and highlight where the needs for leak repair and  
20 pipeline replacement programs are greatest. Spatially-referenced leak data can improve the design  
21 and implementation of such programs by allowing utilities to focus on the sections of their  
22 infrastructure with the largest leaks or the highest leak density (i.e. leaks per mile of pipeline),  
23 where appropriate, after taking safety considerations into account. Exhibit 2 contains a sample  
24 leak map, based on randomly generated data, reflecting the type of data and visual tool that can  
25 be developed using advanced leak detection and leak quantification methods.

1 Similar leak maps were developed as part of the PSE&G-EDF pilot project by overlaying  
2 PSE&G’s infrastructure maps over leak maps reflecting the location and relative size of leaks on  
3 their system. This approach allows utilities to develop an actionable, visual tool reflecting areas  
4 of their infrastructure that are in particular need of replacement or repair efforts.

5 By comparing “before” and “after” scenarios, reflecting reductions in volumes of leaked  
6 gas achieved through the implementation of such programs, utilities, the Commission, and other  
7 stakeholders can evaluate the effectiveness of pipe replacement and leak repair efforts in reducing  
8 system-wide leaks.

9 Currently, National Grid uses emission factors associated with cast iron and unprotected  
10 steel mains to estimate methane emissions reductions from pipeline replacement activities, as  
11 reported under the U.S. Environmental Protection Agency’s Subpart W of the Clean Air Act.<sup>27</sup>  
12 However, actual methane emission reductions would likely be different when measured. Leak  
13 quantification methodologies, and the leak maps and other visual tools that can be developed  
14 using these methods, allow regulatory agencies responsible for allocating ratepayer money to  
15 better assess the need for pipeline replacement or leak repair on different pipeline materials.

16 From a longer term perspective, there is potential for data gathered using these  
17 methodologies to be used to supplement utility hazard ranking algorithms, to order to enhance the  
18 foundational basis used by utilities to identify sections of infrastructure that are most in need of  
19 replacement/repair. Many major utilities use proxy variables for leak flow rate (e.g., a  
20 combination of pipe diameter and pressure) in their hazard ranking models to get a broad  
21 understanding of the volume of leaking gas that could accumulate in an enclosed space, which is  
22 a necessary parameter to include in risk assessments. With leak quantification methodologies now  
23 becoming commercially available, actual, measured leak flow rate can be used instead of  
24 estimates generated using a proxy variable. Measured leak rates that can be geographically  
25 attributed to infrastructure allow a more direct risk assessment to be made than would be possible

---

<sup>27</sup> Testimony of the Gas Infrastructure & Operations Panel, Book 4 – KEDLI, at p. 25.

1 with the use of proxy variables, and can therefore serve as a valuable parameter in main  
2 replacement prioritization.

3 In summary, these new methods provide additional data and perspective around  
4 underground infrastructure condition, leakiness and program need, and can serve as tools that can  
5 help regulatory agencies such as this Commission to better balance program need with ratepayer  
6 interests in maintaining stable rates.

7 This is illustrated by a recent report by PricewaterhouseCoopers which discusses the  
8 benefits of using new data analytics for improved utility asset management, and opportunities to  
9 integrate data gathered using cutting edge technologies, such as mobile leak detection technology,  
10 into utilities' risk management efforts.<sup>28</sup> The authors point out that traditional risk assessment has  
11 relied heavily on subject-matter experts who may use qualitative or subjective data to make  
12 decisions about risk mitigation actions. The report notes that by integrating spatial analytics with  
13 data on asset conditions, gas utilities can obtain a rigorous snapshot of asset risks in near real-  
14 time, showing where and when leaks are likely occur, which can inform investment planning and  
15 project prioritization. Leak flow rate could potentially serve as a useful parameter to assess asset  
16 conditions. The report includes a case study relating to a major gas distribution utility which  
17 sought to optimize its prioritization of capital replacement projects. This company had invested in  
18 Picarro mobile leak detection technology, and sought to use incremental data gathered using this  
19 technology along with historical data to develop a predictive model. For a \$15 million asset  
20 portfolio, this effort led to the following outcomes: an estimated 3.9X more leaks avoided, 3.6X  
21 greater leaks/mile replaced and 4.1X more O&M expense cost savings for the same capital  
22 investment.<sup>29</sup> This is a powerful example of the significant benefits to utilities from using data

---

<sup>28</sup> PricewaterhouseCoopers, "A new view on pipeline risks: How spatial analytics can empower asset management for gas utility companies" (2016) available at [https://www.pwc.com/us/en/power-and-utilities/publications/assets/pwc\\_gas\\_pipeline\\_spatial\\_analytics\\_april\\_2016.pdf](https://www.pwc.com/us/en/power-and-utilities/publications/assets/pwc_gas_pipeline_spatial_analytics_april_2016.pdf).

<sup>29</sup> *Id.*

1           that can be now be gathered using cutting edge technologies to enhance their asset management  
2           efforts.

3           **Q. Please outline the benefits of leak quantification and advanced leak detection methods.**

4           A. Leak data gathered by EDF using mobile leak survey techniques in the service territories of a  
5           number of utilities across the U.S. suggests that the majority of methane emissions from natural  
6           gas distribution systems are attributable to a relatively small number of large leaks, as opposed to  
7           clusters of small leaks. This finding is supported by multiple independent sources. For instance, a  
8           2014 Stanford University study noted, based on many independent experiments, that a small  
9           number of large leaks are responsible for a large fraction of the leakage from natural gas  
10          systems.<sup>30</sup>

11                   Together, these findings underscore the need for utilities to replace leak prone pipeline  
12           materials on their distribution systems, and the benefits of using leak quantification technology to  
13           prioritize such efforts. Using leak quantification techniques to identify large leaks would allow  
14           National Grid to address these leaks first as part of pipeline replacement and leak repair  
15           programs, after addressing those leaks/pipelines that pose a safety risk, thereby facilitating cost  
16           effective leak abatement and infrastructure improvement.

17                   Ratepayers and society as a whole stand to benefit from this approach. First, the larger  
18           reductions in lost gas that leak prioritization can achieve translates into savings for ratepayers  
19           who generally pay both for gas delivered as well as gas lost on the pipeline system. With the  
20           exception of hazardous leaks, which utilities are required to repair immediately, leak  
21           quantification can be used to prioritize non-hazardous leaks for repair, thus improving cost-  
22           effectiveness, by capturing the highest volumes of gas per dollar spent on leak repair.

1           Finally, there are societal benefits from reducing the amount of gas leaked. Methane  
2           makes up about 90% of pipeline quality natural gas,<sup>31</sup> and is a greenhouse gas 84 times more  
3           potent than carbon dioxide over a 20-year time horizon. Considering impacts on climate, methane  
4           emissions therefore come with a cost to society.<sup>32</sup> The social cost of methane has been estimated  
5           at \$140 - \$1300/ton of methane, depending mainly on modeling assumptions and the types of  
6           damages included in the calculations.<sup>33</sup> The Commission has previously considered the costs of  
7           climate change, which are currently external to the costs of natural gas, in an order establishing  
8           the benefit cost analysis framework of Reforming the Energy Vision.<sup>34</sup>

9           Similarly, there are benefits associated with the use of advanced leak detection  
10          technology, which is more sensitive than traditional leak detection equipment and is therefore  
11          capable of finding more leaks. A growing number of utilities are adopting or exploring the  
12          adoption of such new and advanced leak detection equipment. For instance, California-based  
13          utility, Pacific Gas & Electric ("PG&E") piloted the use of Picarro analyzers in 2013. PG&E  
14          notes that this technology is 1,000 times more sensitive than any other commercially available  
15          instrument, with the pilot indicating that the Picarro technology finds many more leaks than  
16          traditional leak survey instruments.<sup>35</sup>

17          CenterPoint Energy, which serves customers in Arkansas, Louisiana, Minnesota,  
18          Mississippi, Oklahoma and Texas has also piloted the technology. Centerpoint Energy has

<sup>34</sup> State of New York Public Service Commission. January 21, 2016. CASE 14-M-0101. Proceeding on Motion of the Commission in Regard to Reforming the Energy Vision.

<sup>35</sup> PG&E Testimony in 2016 Gas Rate Case, Chapter 9, Gas Operations Technology, at p. 9-24.

1 conducted pilots in Houston and Minneapolis to evaluate Picarro’s performance compared to  
2 current methods - both pilots reported more than 5x improvements in leak find rate.<sup>36</sup>

3 The California Public Utilities Commission reports that utilities experienced a 21%  
4 increase in the number of leaks detected from 2013 to 2014, due partly to the use of advanced  
5 leak detection technologies being employed.<sup>37</sup> As utilities start adopting more sensitive surveying  
6 equipment, leak backlogs are likely to grow, increasing the need for, and benefits of, prioritizing  
7 leak abatement activities by considering leak flow rate. PG&E, for instance, plans to test this  
8 technology for the purposes of quantifying the volume of fugitive emissions associated with its  
9 facilities, recognizing that this would improve site efficiency and safety, minimize losses and  
10 reduce greenhouse gas emissions.<sup>38</sup>

11 **Q. Please describe the pilot projects that EDF is conducting in collaboration with National**  
12 **Grid.**

13 A. EDF and National Grid have agreed to collaborate on a suite of pilot projects, in order to advance  
14 the use of new technological solutions to better design and execute its system modernization and  
15 maintenance efforts. EDF and National Grid have previously collaborated on the mapping of  
16 methane leaks in various sections of its service territory. Additionally, National Grid has  
17 participated in a number of research studies aimed at gaining a better understanding of methane  
18 emissions from distribution systems, and is actively engaged in several industry collaborative  
19 efforts to advance the integration of new technologies to assess methane emissions. The new  
20 suite of collaborative pilot projects are intended to build on National Grid’s long-running and  
21 ongoing efforts to enhance its pipe replacement and repair efforts and minimize leaks on its  
22 system.

<sup>38</sup> PG&E Testimony in 2016 Gas Rate Case, Chapter 9, Gas Operations Technology, at p. 9-24.

1           This Commission and its counterparts around the country are required to balance ratepayer  
2           costs and interests with the need for pipe replacement and leak abatement. Detailed information  
3           on the subsurface conditions and the relative “leakiness” of underground mains has hitherto been  
4           unavailable, which complicates the task of assessing the extent of need and overseeing programs  
5           once approved. As explained in further detail below, the projects that EDF and National Grid  
6           have agreed to collaborate on build on EDF’s previous collaborative efforts with major utilities,  
7           including National Grid, and are aimed at providing additional data and perspective around  
8           underground infrastructure condition, leakiness and program need, to help utilities and the  
9           Commission balance the need for pipe replacement/repair efforts with the associated costs. The  
10          key components of this collaborative initiative are outlined below, and described in further detail  
11          in the testimony of Dr. Joseph von Fischer:

12          • **Pilot project addressing National Grid’s leak-prone infrastructure in Staten Island**

13          This pilot project is aimed at using leak flow rate data gathered through EDF’s survey of National  
14          Grid’s service territory in Staten Island in 2014<sup>39</sup> to better prioritize efforts to repair/replace the  
15          KEDNY’s leak-prone infrastructure in Staten Island. EDF and National Grid propose to launch  
16          this project in summer 2016, with a view to making actionable data available to the utility for the  
17          implementation of leak repair/pipe replacement efforts in Staten Island in CY 2017.

18          • **Pilot project addressing National Grid’s leak-prone infrastructure in Long Island**

19          This project will employ a methodological approach similar to the first project outlined above,  
20          and is aimed at better addressing leak-prone infrastructure located in KEDLI’s service territory in  
21          Long Island using leak flow rate data. EDF proposes to dispatch a Google Street View car to  
22          Long Island by spring 2017 or earlier to survey sections of KEDLI’s service territory located  
23          there that have been identified for pipe replacement in 2017.

24          • **Development of emission factors for CISBOT**

---

<sup>39</sup> An overview of the data as well as maps reflecting the results of this survey can be accessed at <http://www.edf.org/climate/methanemaps>.

1 Emission factors have not yet been developed for CISBOT, making it challenging to accurately  
2 estimate its impact in terms of reducing system-wide emissions. This project is aimed at  
3 addressing this challenge by developing emission factors specifically for CISBOT. EDF and  
4 National Grid anticipate that a survey of the relevant sections of KEDNY's service territory in  
5 New York City, and additional locations where CISBOT has been used more intensively than  
6 other sections of National Grid's service territory, would form the most appropriate basis for this  
7 technical project.

8 • **Explore integration of leak flow rate into hazard ranking algorithm**

9 Over the longer term, EDF and National Grid will collaborate to explore the potential for leak  
10 flow rate to be incorporated as a distinct variable, with the appropriate weight, into National  
11 Grid's hazard ranking algorithm.

12 **Q. What are the anticipated benefits of these projects?**

13 A. Building on National Grid's ongoing efforts to minimize leaks on its system, the suite of  
14 collaborative projects is anticipated to offer the following incremental benefits:

- 15 • Opportunity for National Grid and the Commission to gain previously unavailable leak flow  
16 rate data, to use this data to better prioritize leak repair and pipe replacement efforts in Staten  
17 Island and Long Island, and develop a broadly applicable prioritization framework for such  
18 efforts incorporating leak flow rate.
- 19 • Opportunity to correlate leak size with the underlying cause of the leak (for example:  
20 corrosion, material or welds) by considering leak data provided by EDF in conjunction with  
21 utility infrastructure information.
- 22 • Opportunity for National Grid to perform validation studies to evaluate leak detection  
23 technology and/or leak quantification methodology.
- 24 • Opportunity for National Grid to build on its understanding of the operational aspects of  
25 using new and advanced leak detection equipment/technology, which is employed by EDF-

1 CSU for the purposes of conducting the leak survey, by identifying limits of deployment  
2 considering factors such as traffic, atmospheric conditions, GPS availability, etc.

- 3 • Provide preliminary basis for any future GHG credits/reductions efforts.
- 4 • Opportunity to develop more refined analyses of the impact of CISBOT on emissions  
5 reduction, allowing for an improved assessment of its benefits, relative to costs.
- 6 • From a longer term perspective, this collaboration offers National Grid the opportunity to  
7 consider the potential to enhance its hazard ranking algorithm by incorporating leak flow rate  
8 as a new variable, with the appropriate weight.

9 These benefits are consistent with National Grid's objectives as stated in its testimony;  
10 that is, to accelerate reductions of natural gas leaks on its distribution system with a view to  
11 enhancing overall system reliability and integrity.<sup>40</sup>

12 **Q. What are your recommendations in relation to the implementation of KEDLI and KEDNY's**  
13 **pipe replacement efforts?**

14 A. The Companies would enhance the cost-effectiveness of their leak repair and pipe replacement  
15 programs by using data on leak flow rate, such as that being provided by EDF, as a factor in  
16 prioritizing pipeline replacement and leak repair. Focusing on the largest leaks first, after  
17 addressing those that pose a safety threat, will provide enhanced benefits to ratepayers by  
18 reducing the amount of lost gas, and will also offer environmental benefits, as discussed above.  
19 Accordingly, it is recommended that KEDLI employ data on leak flow rate that will be gathered  
20 by EDF in its Long Island service territory in order to prioritize its leak repair and replacement  
21 activities there across the Data Year and Rate Years, as appropriate. Similarly, it is recommended  
22 that KEDNY employ such data previously gathered by EDF in its service territory in Staten  
23 Island in order to prioritize its leak repair and replacement activities there across the Data Year  
24 and Rate Years.

---

<sup>40</sup> Testimony of the Gas Infrastructure & Operations Panel, Book 4 – KEDLI, at p. 17.

1                   From a longer term perspective, it is recommended that KEDLI and KEDNY consider the  
2                   scope for including new data available in the form of leak flow rate into their hazard ranking  
3                   algorithm, in order to enhance the foundational basis of their system modernization and  
4                   maintenance efforts.

5 **VI. CONCLUSION**

6 **Q. Please summarize your recommendations and conclusions.**

7                   A. Based on my review of testimony submitted on behalf of the Companies, my conclusions and  
8                   recommendations are as follows:

9                   (1) The Companies' proposed accelerated pipe replacement efforts are necessary and appropriate.

10                  (2) The Companies would enhance the cost-effectiveness of their leak repair and pipe  
11                  replacement programs by using data on leak flow rate, such as that being provided by EDF,  
12                  as a factor in prioritizing pipeline replacement and leak repair. Focusing on the largest leaks  
13                  first, after addressing those that pose a safety threat, will provide enhanced benefits to  
14                  ratepayers by reducing the amount of lost gas, and will also provide environmental benefits.  
15                  This Commission should continue to advance its efforts to further the use of industry best  
16                  practices by New York utilities by recognizing the benefits of this emerging best practice and  
17                  creating a pathway for its integration into the Companies' proposed accelerated pipe  
18                  replacement and leak repair efforts.

19                  (3) In the longer term, New York utilities and this Commission should move in the direction of  
20                  enhancing the foundational basis of utilities' system modernization and maintenance efforts.

21                  It is therefore recommended that KEDLI and KEDNY consider the scope for including leak  
22                  flow rate as a new variable, with the appropriate weight, into their hazard ranking algorithms,  
23                  in order to enhance the foundational basis of their system modernization and maintenance  
24                  efforts.

25 **Q. Does this conclude your testimony?**

26                  A. Yes.
