FROM: Joint Utilities of New York – Interconnection Technical Working Group

RE: 07/19/17 ITWG Meeting Follow-Ups – Interconnection Application Requirements for Energy Storage Systems (ESS)

Pursuant to your request, here is the response from the Joint Utilities of New York ("JU") regarding interconnection application requirements for Energy Storage Systems (ESS) to distribution systems. This response reflects the position of all the utilities identified on this letterhead, although it does not necessarily apply to all network systems. This information is preliminary for discussion purposes and is not intended to represent a final position on any issues.
I. Purpose
The purpose of this document is to highlight additional questions to be asked of the Developer regarding the interconnection of battery or energy storage systems (ESS) within the distribution system, beyond what is already required through the New York State Standardized Interconnection Requirements, Interconnection Technical Working Group documentation, and individual utility interconnection requirements. This information shall be required as a part of a complete application package.

II. Scope
In-scope is behind-the-meter (BTM) mass market residential or commercial; BTM commercial and industrial; and remote net metered or community distributed generation (DG) system. Standalone ESS assets directly connected to the distribution system are also in-scope. This scope covers:

1. Technology: electricity battery storage
2. Max Net Export: the maximum net export of the combined DG and ESS to be studied by the utility, as specified by the applicant and enforced by an approved control scheme.
3. Max Net Import/Load: the maximum import of the combined DG and ESS from the distribution system to be studied by the utility. The ESS may be charged from DG only, a combination of DG and distribution system supply, or from distribution system supply only.
4. Nameplate Rating: only for qualification under the SIR, the nameplate ratings of the DG and ESS shall be less than or equal to 5MWac.
5. Dispatch/discharge: dispatch or discharge of ESS and DG is limited to the Max Net Export above.

Community microgrids and other multiple-tenant or individual facility islanding applications are out of scope.

III. System Equipment Characteristics
a. Indicate the type of DG and energy storage technologies to be used. For example, common types of anticipated DG could be photovoltaic (PV) and the energy storage technologies to include NaS, Dry Cell, PB-acid, Li-ion, vanadium flow, etc.

b. Provide the model, capacity (kWh), and manufacturer of the battery portion of the energy storage equipment.

c. Provide proposed inverter(s) power factor operating range and whether inverter(s) are single quadrant, two-quadrant, or four-quadrant operation.

d. Provide specification data/rating sheets including the manufacturer, model, and nameplate ratings (kW) of the inverter(s)/converters(s) for the energy storage and/or DG system, and to include required ancillary equipment demand levels such as battery heating and cooling requirements.

1 Note: This is the prevalent type of energy storage marketed to the JU at present; consequently this is the JU’s current focus.

Deleted: Nameplate Rating: total aggregate nameplate rating of the DG and coupled ESS that is less than or equal to 5 MW.

Deleted: Charging

Deleted: may be limited to no net export of energy or nameplate of DG only, or may have no limitations

Comment [MK1]: For the information in Sections 3-5, we recommend specifying where these should be indicated – i.e. revisions or additions to Appendix B, in drawings, or a separate attachments

Deleted: ‘#’ Indicate any impacts of ambient temperatures on charging and discharging capabilities, specifically noting any restrictions on available capacity as a function of temperature and listed on the system facility’s nameplate.

[1]
(HVAC), pump loading, etc.
e. Provide details on whether the inverter(s)/converter(s) have any intrinsic grid support functions, such as California Rule 21 Phase 1, Phase 2, and/or Phase 3 capabilities for autonomous or interactive voltage and frequency support. If they do, please describe these functions and any default settings.
f. Indicate whether the energy storage and DG system inverter(s)/converter(s) are DC-coupled or AC-coupled.
g. Indicate whether the system inverter(s)/converter(s) is/are listed on the NY DPS “Certified Interconnection Equipment List”\(^3\) (yes, it is on the list or else no, it is not on the list) and/or whether the components are UL 1741 SA certified.
   a. If the interconnected inverter(s)/converter(s) are not listed on the “Certified Interconnection Equipment List” but are certified, provide a copy of the certificate of compliance.
   b. If the interconnected inverter(s)/converter(s) are not listed on the “Certified Interconnection Equipment List” or otherwise UL 1741 SA certified, please detail the use of utility grade relays used in interconnection protection, including AC and DC control schematics and relay logic.
   c. If the interconnected inverter(s)/converter(s) are not listed on the “Certified Interconnection Equipment List”, please detail the verification of protection operation in equivalent deployments of the equipment configuration. For example, if this exact configuration has been previously deployed, please describe the project and reference the commissioning/test report.
   d. Identify if inverter analytical models are available for use in the utility’s power flow analysis program.
h. Indicate whether the interconnected inverters inverter(s)/converter(s) is/are compliant to the latest versions of the following additional standards. If partially compliant to subsections of the latest standards, please list those subsections:
   1. IEEE 1547a
   2. IEEE 519-2014
   3. UL 1741-SA

\(^3\) If the inverter is packaged together with the battery system, or packaged with other system components as a unique assembly, then the overall assembly (inverter and all components) must be examined. Supplemental documentation to submit should include:
   a. Shop drawings illustrating the physical product.
   b. Single line diagrams showing equipment layout.
   c. Three-line schematics showing protective device and monitoring equipment.
   d. DC schematic showing control logic.
   e. Operating procedure including scheduled times of charging and dispatch.

3 http://www3.dps.ny.gov/W/PSCWeb.nsf/96f0fec0b45a3c6485257688006a701a/dcf68efca391ad6085257687006f396b/$FILE/06598086.docx/Current%20SIR%20Devices%207-31-2017.docx
l. If the interconnected inverter(s)/converters are not compliant with the previously listed standards, please describe your future intentions going forward to comply with these standards.

m. Detail any integrated protection that is included in the interconnected inverter(s)/converters. For example, describing over/under-voltage/current frequency behavior and reconnection behavior would comply, such as solid state transfer switching or other.

n. If the intended use case for the ESS includes BTM backup services, please provide a description and documentation illustrating how the entire system disconnects from utility during an outage (e.g. mechanical or electronic, coordination, etc.).

IV. System Electrical Characteristics

Please indicate the following:

a. Max planned export of the system (kWac)

b. Max planned import of the system (kWac)

c. Short circuit current capabilities and harmonic output from the energy storage and/or DG system (from nameplate of inverters given the use of standard relaying).

d. Max ramp rate of the system (for generating/dispatching or charging)

e. Max cycling frequency

f. Response time for any supplemental protective device tripping

g. Provide details on grounding of the interconnected energy storage and/or DG system to meet utility effective grounding requirements.

h. Provide a summary of protection and control scheme functionality and provide details of any integrated protection or control schematics and default settings within controllers.

i. Provide descriptions of any software functionality that enables intelligent charging and discharging of the ESS using interconnected DG, such as PV. For example, if the ESS can be charged only through the DG input, or if the ESS can be switched to be charged from the line input, provide those details.

j. Provide details on standard communication hardware interfaces that are available, e.g., TCP/IP, serial, etc.¹

k. Provide details on standard communication protocols that are available, e.g., MODBUS, DNP-3, 2030.5, etc.²

l. Provide details on standard communication data models that are available, e.g., 61850-90-7, SunSpec, MESA, etc.³

³ This information will be required for all communicating devices and is not exclusive to storage. This information will need to be part of the updated SIR.
V. Market Participation – Unlike Sections III and IV, this information is a non-binding voluntary survey and will not be used for Technical Study.

a. Is the system intended to operate in the NYISO market? If so, what are the currently intended compensation streams there?

b. Is the system intended to be compensated under the VDER Phase One tariff? If so, what elements of the value stack are currently planned as part of the system’s compensation streams?
