New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs –

Residential, Multi-Family, and Commercial/Industrial Measures

Version 6

Issue Date – April 16, 2018
Effective Date – January 1, 2019

New York State Joint Utilities

Version History of the New York State Technical Resource Manual:

Version	Title	Issued
n/a	**New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs –** *Selected Residential and Small Commercial Measures (Electric)*	12/28/2008
n/a	**New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs (Gas)** – *Selected Residential and Small Commercial Gas Measures*	3/25/2009
n/a	**New York Standard Approach for Estimating Energy Savings from Energy Efficiency Measures in Multi-family Programs**	7/9/2009
n/a	**New York Standard Approach for Estimating Energy Savings from Energy Efficiency Measures in Commercial Industrial Programs**	9/1/2009
n/a	**New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs –** *Single Family Residential Measures*	12/16/2009
1	**New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs –** *Residential, Multi-family, and Commercial/Industrial Measures*	10/15/2010
2	**New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs –** *Residential, Multi-family, and Commercial/Industrial Measures*	12/10/2014
3	**New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs –** *Residential, Multi-family, and Commercial/Industrial Measures*	6/1/2015
4	**New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs –** *Residential, Multi-family, and Commercial/Industrial Measures*	4/29/2016
5	**New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs –** *Residential, Multi-family, and Commercial/Industrial Measures*	7/17/2017
5.1	**New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs –** *Residential, Multi-family, and Commercial/Industrial Measures*	3/15/2018

5.2	**New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs –** *Residential, Multi-family, and Commercial/Industrial Measures*	4/10/2018
6	**New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs –** *Residential, Multi-family, and Commercial/Industrial Measures*	4/16/2018

Acknowledgements The *New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs – Residential, Multi-family, and Commercial/Industrial Measures*, Version 6, dated April 16, 2018, was updated by the Technical Resource Manual Management Committee lead by the Joint Utilities[1] in consultation with New York State Department of Public Service. In accordance with the Commission's February 26, 2015 Order in Case 14-M-0101 – Proceeding on the Motion of the Commission in Regard to Reforming the Energy Vision, Staff has transferred this document to the Joint Utilities as of June 1, 2015 to support the Joint Utilities in assuming responsibility for the ongoing maintenance of the Technical Resource Manual.

Table of Revisions/Changes

Revision Number	Addition/ Revision	Issue Date	Effective Date	Measure	Description of Change	Location/Page in TRM
12-17-1	R	12/31/2017	1/1/2019	R/MF - Clothes Dryer	Updated measure description and key variable values to align with current ENERGY STAR requirements and federal standards. Revised formulas. Updated footnotes and references. Added description of ancillary HVAC impacts. Moved EUL information to Appendix P.	Pg. 13
12-17-2	R	12/31/2017	1/1/2019	R/MF - Refrigerator and Freezer Recycling	Updated measure description. Revised formulas. Revised deemed savings to align with conducted NY evaluations. Updated footnotes and references. Moved EUL information to Appendix P.	Pg. 38
12-17-3	R	12/31/2017	1/1/2019	R/MF - Heat Pump Water Heater (HPWH) -Air Source	Updated measure description and key variable values to align with federal standards and other relevant resources. Significantly revised methodology. Updated footnotes and references. Moved EUL information to Appendix P.	Pg. 59
12-17-4	R	12/31/2017	1/1/2019	R/MF - Indirect Water Heater	Updated measure description and key variable values to align with federal standards and other relevant resources. Revised heat loss coefficient derivation methodology. Updated footnotes and references. Moved EUL information to Appendix P.	Pg. 67

Revision Number	Addition/ Revision	Issue Date	Effective Date	Measure	Description of Change	Location/Page in TRM
12-17-5	R	12/31/2017	1/1/2019	R/MF - Storage Tank and Instantaneous Domestic Water Heater	Updated measure description and key variable values to align with federal standards and other relevant resources. Revised heat loss coefficient derivation methodology. Reflected shift from EF to UEF. Updated footnotes and references. Moved EUL information to Appendix P.	Pg. 72
12-17-6	R	12/31/2017	1/1/2019	R/MF - Air Conditioner - Central (CAC)	Updated measure description and key variable values to align with federal standards and other relevant resources. Updated footnotes and references. Moved EUL information to Appendix P.	Pg. 96
12-17-7	R	12/31/2017	1/1/2019	R/MF - Blower Fan – with Electronically Commutated (EC) Motor for Furnace Distribution	Updated measure description. Added peak demand savings methodology. Revised deemed savings values to align with referenced study. Updated footnotes and references. Moved EUL information to Appendix P.	Pg. 110
12-17-8	R	12/31/2017	1/1/2019	R/MF - Heat Pump - Air Source (ASHP)	Updated measure description and key variable values to align with federal standards and other relevant resources. Updated footnotes and references. Moved EUL information to Appendix P.	Pg. 126
12-17-9	R	12/31/2017	1/1/2019	C/I - Air Compressor	Updated measure description. Removed Load/Unload option from eligible control types. Moved EUL information to Appendix P.	Pg. 219

Revision Number	Addition/ Revision	Issue Date	Effective Date	Measure	Description of Change	Location/Page in TRM
12-17-10	R	12/31/2017	1/1/2019	C/I - Storage Tank Water Heater	Updated measure description and key variable values to align with federal standards and other relevant resources. Revised heat loss coefficient derivation methodology. Updated assumed GPD table. Revised Ancillary HVAC Impacts sections. Updated footnotes and references. Moved EUL information to Appendix P.	Pg. 236
12-17-11	R	12/31/2017	1/1/2019	C/I - Unitary Air Conditioner and Unitary & Applied Heat Pump	Updated measure description and key variable values to align with federal standards, NYS/NYC Code and other relevant resources. Updated footnotes and references. Moved EUL information to Appendix P.	Pg. 258
12-17-12	R	12/31/2017	1/1/2019	C/I - Chiller – Cooling Tower	Updated measure description. Moved EUL information to Appendix P.	Pg. 272
12-17-13	R	12/31/2017	1/1/2019	C/I - Furnace and Boiler	Updated measure description and key variable values to align with NYS/NYC Code and other relevant resources. Removed Compliance Efficiency table. Updated footnotes and references. Moved EUL information to Appendix P.	Pg. 284
12-17-14	R	12/31/2017	1/1/2019	C/I - Air Conditioner and Heat Pump – Packaged Terminal	Updated measure description and key variable values to align with federal standards, NYS/NYC Code and other relevant resources. Updated footnotes and references. Moved EUL information to Appendix P.	Pg. 294

Revision Number	Addition/ Revision	Issue Date	Effective Date	Measure	Description of Change	Location/Page in TRM
3-18-1	R	3/29/2018	1/1/2019	R/MF Advanced Power Strip	Updated source and values of Tier 2 deemed savings; Updated Measure Description and Operating Hours section to delineate Tier 1 and Tier 2 equipment.	Pg. 30
3-18-2	R	3/29/2018	1/1/2019	R/MF Room Air Conditioner	Revised to reflect CEER rating standard; Updated Baseline Efficiencies section to current code; Revised EUL source/value; Modified Operating Hours.	Pg. 100
3-18-3	R	3/29/2018	1/1/2019	C/I Economizer – Air Side with Dual Enthalpy Control	Revised Measure Description; Clarified ambiguity regarding applicable appendix table; Revised EUL source/value.	Pg. 282
3-18-4	R	3/29/2018	1/1/2019	C/I Refrigerated Case Night Cover	Modified savings estimation approach to account for previous and current code required energy consumption; Updated Measure Description, Baseline and Compliance Efficiency sections; Revised Operating Hours.	Pg. 339
3-18-5	R	3/29/2018	1/1/2019	C/I Evaporator Fan Control	Updated Measure Description, Baseline and Compliance Efficiency and Operating Hours sections; Simplified estimation approach using deemed savings values.	Pg. 352
3-18-6	R	3/29/2018	1/1/2019	R/MF Clothes Washer	Updated to reflect new ENERGY STAR® standard; Updated findings from RECS data; Updated EUL source and value.	Pg. 6

Revision Number	Addition/ Revision	Issue Date	Effective Date	Measure	Description of Change	Location/Page in TRM
3-18-7	R	3/29/2018	1/1/2019	R/MF Refrigerator and Freezer Replacement	Revised Measure Description and eligibility criteria; Removed F_{market} adjustment; Removed Early Replacement language and provisions; Expanded gas impact equation to ignore interactive cooling effects; Updated Baseline and Compliance Efficiency sections to align with new criteria; Updated EUL source and value.	Pg. 26
3-18-8	R	3/29/2018	1/1/2019	R/MF Room Air Conditioner - Recycling	Substantially revised overall approach to align with intent of quantified impacts; Revised to reflect CEER rating standard; Added default capacity values; Updated default efficiency values to current code; Revised Operating Hours, CF and EUL value/source. Included EER/CEER conversion.	Pg. 34
3-18-9	R	3/29/2018	3/30/2018	R/MF Domestic Hot Water Tank Blanket	No revisions applied – Measure marked for removal from TRM.	N/A
3-18-10	R	3/29/2018	1/1/2019	C/I Low-Flow Pre Rinse Spray Valve	Revised algorithms for consistency with other measures; Updated baseline GPM to align with code effective in 2019; Updated Operating Hours section; Revised temperature and efficiency default variable values.	Pg. 251

Revision Number	Addition/ Revision	Issue Date	Effective Date	Measure	Description of Change	Location/Page in TRM
3-18-11	R	3/29/2018	1/1/2019	R/MF Heat Pump – Ground Source	Added sizing restriction to <65,000 MBh; Simplified algorithms with use of cooling and heating system binary factors; Removed EFLH adjustment factor from peak demand savings formula; Added clarifications, SEER to EER conversion and HSPF to COP conversion to Baseline Efficiencies section; Corrected Fcooling/Fheating table of values.	Pg. 130
3-18-12	R	3/29/2018	1/1/2019	R/MF Dehumidifier	Revised Measure Description; Updated estimation approach to calculation rather than deemed values; Updated to reflect new ENERGY STAR® standard and code requirements; Added Operating Hours; Updated CF and EUL value/source.	Pg. 17
3-18-13	R	3/29/2018	1/1/2019	R/MF Furnace Tune Up	Added provisions for blower fan savings; Revised write-up for consistency with other measures.	Pg. 124
3-18-14	R	3/29/2018	1/1/2019	C/I Indirect Water Heater	Revised Measure Description including restriction to small commercial systems with zone priority control; Updated temperature and efficiency default variable values; Revised GPD assumptions; Updated heat loss coefficient sections; Updated Baseline and Compliance Efficiency sections; Added ancillary electric impacts language.	Pg. 228
3-18-15	R	3/29/2018	1/1/2019	C/I Air Cooled Refrigeration Condenser	Updated Measure Description; Corrected issue regarding approach temperature eligibility requirements.	Pg. 332

Revision Number	Addition/ Revision	Issue Date	Effective Date	Measure	Description of Change	Location/Page in TRM
3-18-16	R	3/29/2018	1/1/2019	C/I Freezer and Cooler Door Strip	Clarified Measure Description; Simplified savings estimation approach; Updated CF; Added Operating Hours; Added Ancillary Impacts language.	Pg. 343
3-18-17	A	3/29/2018	3/29/2018	R/MF Learning Thermostat	New Measure Added	Pg. 143
3-18-18	A	3/29/2018	3/29/2018	C/I Ovens, Steamers, Fryers and Griddles	New Measure Added	Pg. 187
3-18-19	A	3/29/2018	3/29/2018	C/I Combination Ovens	New Measure Added	Pg. 175
3-18-20	A	3/29/2018	3/29/2018	C/I Insulated Holding Cabinets	New Measure Added	Pg. 183
3-18-21	R	3/29/2018	1/1/2019	Appendix P	Updated EUL entries for all measures contained in this Record of Revision.	Pg. 626
3-18-22	R	3/29/2018	1/1/2019	Glossary	Added entries to align with all measures contained in this Record of Revision.	Pg. 639

Note: Revisions and additions to the measures listed above were undertaken by the Joint Utilities Technical Resource Manual (TRM) Management Committee between July 1, 2017 – March 29, 2018.

TABLE OF CONTENTS

INTRODUCTION

The Commission is committed to using the best possible information in the estimation of savings from measures installed through ratepayer funded energy efficiency programs. Information contained within this manual supersedes information contained in earlier versions and is effective as of the date specified.

HISTORY

In a series of Commission orders related to approving the portfolio of programs associated with the Energy Efficiency Portfolio Standard (EEPS), the Commission approved technical manuals designed to provide a standardized, fair, and transparent approach for measuring program energy savings. The five technical manuals approved between December 2008 and December 2009 covered a variety of measures applicable to the single-family, multi-family, and commercial/industrial sectors. They were consolidated into one manual entitled, *New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs-Residential, Multi-family, and Commercial/Industrial Measures* (“the Consolidated Technical Resource Manual”) dated October 15, 2010[2] with an effective date of January 1, 2011.

On December, 10, 2014, the Department of Public Service Staff (Staff), released the *New York Standard Approach for Estimating Energy Savings from Energy Efficiency Program – Single and Multi-Family Residential, and Commercial/Industrial Measures, Version 2* (Version 2) incorporating all revisions between October 15, 2011 and September 30, 2014, with an effective date of December 10, 2014.

The release of the *New York Standard Approach for Estimating Energy Savings from Energy Efficiency Program – Single and Multi-Family Residential, and Commercial/Industrial Measures, Version 3* (Version 3) incorporated all revisions between December 10, 2014 and June 1, 2015, with an effective date of January 1, 2016.

The release of the *New York Standard Approach for Estimating Energy Savings from Energy Efficiency Program – Single and Multi-Family Residential, and Commercial/Industrial Measures, Version 4* (Version 4) incorporated all revisions between December 10, 2014 and June 1, 2015, with an effective date of January 1, 2017.

The release of the *New York Standard Approach for Estimating Energy Savings from Energy Efficiency Program – Single and Multi-Family Residential, and Commercial/Industrial Measures, Version 5* (Version 5) incorporates all revisions between April 29, 2016 and June 30, 2017, with an effective date of January 1, 2018.

The release of the *New York Standard Approach for Estimating Energy Savings from Energy Efficiency Program – Single and Multi-Family Residential, and Commercial/Industrial Measures, Version 5.1* (Version 5.1) incorporated all revisions between July 1, 2017 and December 31, 2017

[2] For purposes of tracking Technical Resource Manual updates, the October 15, 2010 Consolidated Technical Resource Manual will also be referred to as Version 1, with the protocol of all subsequent Consolidated Updates being released with sequential Version numbers.

with an effective date of January 1, 2018. Version 5.1 was filed for administrtative purposes so that information effective January 1, 2018 is published in one location.

The release of the *New York Standard Approach for Estimating Energy Savings from Energy Efficiency Program – Single and Multi-Family Residential, and Commercial/Industrial Measures, Version 5.2* (Version 5.2) incorporated all revisions between July 1, 2017 and December 31, 2017 with an effective date of January 1, 2018. Version 5.2 was filed for administrtative purposes so that information effective January 1, 2018 was published in one location. Version 5.2 includes omissions found in the compiling of Q3-2017 Records-of Revision into Version 5.1.

This current release of the *New York Standard Approach for Estimating Energy Savings from Energy Efficiency Program – Single and Multi-Family Residential, and Commercial/Industrial Measures, Version 6* (Version 6) incorporates all revisions between July 1, 2017 and March 29, 2018, with an effective date of January 1, 2019, new measures between December 31, 2017 and March 29, 2018 with an effective date of March 29, 2018 as well as the removal of one measure effective March 30, 2018.

For a reference of historical changes to measures presented in the Technical Resource Manual (TRM), each measure chapter includes a section titled "Record of Revision." If the measure was not revised between its original publication (in 2008-2009) and its publication in the Consolidated Technical Resource Manual, the Revision Number is 0. If the measure was added/revised between its original publication (in 2008-2009) and its publication in the Consolidated Technical Manual, the Revision Number will correspond to the number of changes/additions of that measure (ex. 1 or 2). Since the publication of the Consolidated Technical Resource Manual, dated October 15, 2010, Staff has worked with the E^2 Working Group[3] and its Technical Resource Manual/Measure Classification Lists Subcommittee to review and approve proposed revisions utilizing the process established by Commission Order[4]. These revisions have been documented through the issuance of Record of Revisions and the Revision Number will correspond to the Revision Number assigned on its date of issue. These Revision Numbers identifies the month and year of the Record of Revision in which the measure appeared and includes an index number, which indicates the order in which that measure appeared in the identified Record of Revision (e.g. Revision Number "1-17-5" refers to the fifth measure appearing in the Record of Revision published in January 2017). Revisions made subsequent to the release of Version 6 have been compiled for ease of reference in the "Table of Revisions/Changes" located just before the Table of Contents in this manual. These revisions are issued concurrent with Version 6.

[3] The E^2 Working Group was formed on February 28, 2014 per the December 26, 2013 Commission Order in Case 07-M-0548 which directed the merger of the functions of the former Implementation Advisory Group (IAG) and the Evaluation Advisory Group (EAG) and directed Staff to work with NYSERDA and the utilities to form an E^2 Working Group.

[4] Case 07-M-0548, Order Approving Modifications to the Energy Efficiency Portfolio Standard (EEPS) Program to Streamline and Increase Flexibility in Administration (issued June 20, 2011).

SYSTEM PEAK DEMAND DEFINITION

System peak demand typically refers to the highest amount of electricity being consumed at any one point in time across the entire system network. In most cases, the system network referred to is the New York Control Area, managed by the New York Independent System Operator. It is the maximum level of hourly demand during a specific period. The peak periods most commonly identified are annual and seasonal (summer and winter). [5] Peak coincident demand is the demand of a measure that occurs at the same time as the system peak.

The Tech Manual equations are developed to estimate peak electricity savings (kW) along with electricity consumption and gas consumption savings. The definition of the peak demand period for conducting engineering simulations and estimating coincidence factors are as follows:

Electricity

According to the NYISO, system peaks generally occur during the hour ending at 5 pm on the hottest non-holiday weekday. The peak day can occur in June, July, or August, depending on the weather. Program Administrators (PAs) should calculate coincident peak demand savings based on the hottest summer non-holiday weekday during the hour ending at 5pm.

Building energy simulation programs or other calculation techniques using the Typical Meteorological Year version 3 (TMY3) data from the National Renewable Energy Laboratory (NREL) shall use the calendar year definition and day of the year as shown below:

City	Date	Temperature	Calendar Year
Albany	July 21	96	1995
Buffalo	July 21	89	1995
Massena	August 15	94	1997
NYC (LGA)	July 13	98	1990
Syracuse	July 4	97	2003
Binghamton	August 14	93	1998
Poughkeepsie	June 10	92	2005

Note: For peak demand simulations, the calendar year is defined so that the days above fall on a non-holiday Friday. For Syracuse, this requires redefining the July 4th holiday.

Building energy simulation programs or other calculation techniques using different weather data sets shall choose a coincident peak demand hour consistent with the NY ISO definition above.

Natural Gas

The peak gas definition is based on the program-induced change in the average daily gas flow in which the distribution system, on average, reaches its pumping/consumption capacity such that as the temperature falls lower (or the heating degree days go higher) gas consumption does not increase. Setting the peak gas definition for this condition means that the gas peak is calculated to

[5] Glossary of Terms, Version 2.1, Northeast Energy Efficiency Partnerships, A project of the Regional Evaluation, Measurement and Verification Forum, Prepared by Paul Horowitz PAH Associates, p.25.

reflect the decreased cubic feet of natural gas expected to not flow through the distribution system during the 24-hour period as a result of the impacts of the gas energy efficiency program.

NATURAL GAS PEAK SAVINGS DEFINITION

Up State: The number of therms saved during a day, a 24 hour period starting at 10:00AM, in which the average temperature is minus nine -9^{o}F (-22.8 ^{o}C).

Down State: The number of therms saved during a day, a 24 hour period starting at 10:00AM, in which the average temperature is zero^{o}F (-17.8^{o}C).

COINCIDENCE FACTOR

For purposes used in this manual, the Coincidence Factor (CF) is expressed as a ratio with the numerator being the simultaneous demand of a similar group of electrical appliances (measures) within a specified period, to the sum of their individual maximum demands within the same period.

ANCILLARY NON-GAS FOSSIL FUEL IMPACTS

The measures in this Manual that provide non-gas fuel interactions shall use the therm impact equations, with the following conversion factors:

Fuel	Heating value	Conversion Factor
Propane	71,000 Btu/gal	1.41 gal per therm
#2 Fuel Oil	115,000 Btu/gal	0.87 gal per therm
#6 Fuel Oil	124,000 Btu/gal	0.81 gal per therm

ANNUAL/LIFE-CYCLE SAVINGS

The energy savings methodologies presented in this Manual are designed to provide first year annual gross energy savings. Life cycle energy savings are calculated by multiplying first year gross energy savings by the EUL.

NET TO GROSS ADJUSTMENTS

The savings approaches presented in this Manual provide gross energy saving estimates and specify the approaches for obtaining those estimates. The New York Department of Public Service policy specifies that savings projections used for predicting energy savings will be net savings. To arrive at net savings the gross estimates presented in this Manual must be adjusted to account for free riders and spillover.

Free rider adjustments erode the gross savings estimate by subtracting out the savings that would have occurred without the program’s incentive or influence. Spillover adjustments increase savings by counting the additional savings that occur as a result of two possible conditions. First, participants can replicate that same action (participant spillover) outside of the program participation process, providing additional savings. Second, the program can influence the way non-participants make energy saving decisions that result in additional savings not associated with a specific participation event. Together, the subtraction of savings for free riders, plus the addition of savings for spillover tend to offset each other to a significant degree. As a result, for the purposes of estimating program impacts, the savings estimates presented in this Manual, or the savings produced using the calculation approaches described in this Manual, must be multiplied by 0.90 to arrive at an estimated net energy savings for each measure.

As program evaluations are completed, this factor will be adjusted up or down as appropriate by program, for each measure included in this Manual. Over time, the adjustment factor will evolve to be more accurate and will be focused on specific types of programs and delivery approaches. To continue to standardize the net impact estimation approach at this time, a net to gross conversion factor of 0.90 will continue to be applied to the gross saving estimates.

EQUIVALENT FULL LOAD HOURS (EFLH), FOR HEATING OR COOLING

The equivalent hours that a measure would need to operate at its peak capacity in order to consume its estimated annual kWh consumption (annual kWh/connected kW).[6] The ratio of the annual building energy (cooling or heating) consumed to the peak energy required is used to calculate EFLH. The listing of heating and cooling Equivalent Full Load Hours for seven cities in New York State can be found in Appendix G. Accordingly, the ratio for EFLH cooling is shown below:

$$EFLH_{cooling} = \left(\frac{\text{Annual } kWh_{cooling}}{kW_{peak,\ cooling}} \right)$$

SINGLE AND MULTI-FAMILY RESIDENTIAL MEASURES

APPLIANCE

CLOTHES WASHER

Measure Description

This measure covers residential grade clothes washers meeting the criteria established under the ENERGY STAR® Program, Version 8.0, effective February 5, 2018, installed in residential settings.[7] ENERGY STAR® clothes washers have a higher Integrated Modified Energy Factor (IMEF) and a lower Integrated Water Factor (IWF), saving energy and water with greater tub capacities and sophisticated wash and rinse systems. Rather than filling the tub with water, efficient wash cycles are achieved by spinning or flipping clothes through a stream of water. Efficient rinse cycles are achieved through high-pressure spraying instead of soaking clothes. Reduced dryer load represents additional energy savings associated with the thorough removal of water from the clothes in the washer. Clothes washers originally qualified for the ENERGY STAR® label in 1997. Clothes washers that have earned this label use approximately 25% less energy and 45% less water than comparable non-qualified models.[8]

This measure addresses installation of top and front-loading residential clothes washers with capacities greater than 1.6 ft^3 and less than 8.0 ft^3. This measure applies to residential equipment installed in single-family homes or in multifamily buildings within the residential unit; it is not intended for use with washers in multifamily common areas.

The algorithms, inputs, and savings presented below assume a normal replacement scenario.

Method for Calculating Annual Energy and Peak Coincident Demand Savings[9]

Annual Electric Energy Savings

$$\Delta kWh = units \times \left[\Delta kWh_{washer} + (\Delta kWh_{wh} \times ElecSF_{wh}) + (\Delta kWh_{dryer} \times ElecSF_{dryer})\right]$$

Peak Coincident Demand Savings

$$\Delta kW = \frac{\Delta kWh}{hrs} \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times \left[(\Delta therm_{wh} \times GasSF_{wh}) + (\Delta therm_{dryer} \times GasSF_{dryer})\right]$$

[7] ENERGY STAR® Program Requirements Product Specification for Clothes Washers, Eligibility Criteria Version 8.0, February 2018
[8] Efficiency of ENERGY STAR® products: https://www.energystar.gov/products/appliances/clothes_washers
[9] Savings calculator for ENERGY STAR® Qualified Appliances (accessed 2/8/2018)

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
ΔkWh_{washer}	= Annual clothes washer electric energy savings
ΔkWh_{wh}	= Annual electric water heating energy savings
ΔkWh_{dryer}	= Annual electric dryer energy savings
$ElecSF_{wh}$	= Electric Savings Factor for water heaters
$ElecSF_{dryer}$	= Electric Savings Factor for dryers
$\Delta therm_{wh}$	= Annual gas water heating energy savings
$\Delta therm_{dryer}$	= Annual gas dryer energy savings
$GasSF_{wh}$	= Gas Savings Factor for water heaters
$GasSF_{dryer}$	= Gas Savings Factor for dryers
hrs	= Annual run hours of clothes washer
CF	= Coincidence Factor

Summary of Variables and Data Sources

Variable	Value	Notes
ΔkWh_{washer}		Lookup from Per Unit Savings table below, based on product class.
ΔkWh_{wh}		Lookup from Per Unit Savings table below, based on product class.
ΔkWh_{dryer}		Lookup from Per Unit Savings table below, based on product class.
$ElecSF_{wh}$	Electric WH: 100% Gas WH: 0% Unknown: 34%	Based on EIA Residential Energy Consumption Survey (RECS) 2015 for Middle Atlantic States.[10]
$ElecSF_{dryer}$	Electric Dryer: 100% Gas Dryer: 0% Unknown: 67%	Based on EIA Residential Energy Consumption Survey (RECS) 2015 for Middle Atlantic States.[11]
$\Delta therms_{wh}$		Lookup from Per Unit Savings table below, based on product class.
$\Delta therms_{dryer}$		Lookup from Per Unit Savings table below, based on product class.

[10] EIA Residential Energy Consumption Survey (RECS) 2015 for Middle Atlantic States, Table HC1.7 (“Unknown” calculated as the number of homes with electric water heating divided by the total number of homes with electric or gas water heating)

[11] EIA Residential Energy Consumption Survey (RECS) 2015 for Middle Atlantic States, Table HC3.7 (“Unknown” calculated as the number of homes with electric dryers divided by the total number of homes with electric or gas dryers)

hrs	295	
CF	0.029	

Integrated Modified Energy Factor, IMEF[14] (ft^3/kWh/cycle), is the energy performance metric for ENERGY STAR® certified residential clothes washers as of March 7, 2015.

IMEF is a measure of energy efficiency that considers the energy used by the washer during the cycle and while on standby, the energy used to heat the water, and the energy used to run the dryer. IMEF is the quotient of the cubic foot (or liter) capacity of the clothes container divided by the sum of the machine electrical energy consumption, the hot water energy consumption, the energy required for removal of the remaining moisture in the wash load, and the combined low-power mode energy consumption. A higher IMEF value reflects a more efficient clothes washer.[15]

Integrated Water Factor, IWF[16] is the water performance metric for residential clothes washers that allows the comparison of clothes washer water consumption independent of clothes washer capacity. Manufacturers must submit their water consumption factors with their ENERGY STAR® certified residential clothes washers. IWF is the quotient of the total weighted per-cycle water consumption for all wash cycles in gallons divided by the cubic foot (or liter) capacity of the clothes washer. A lower value reflects a more efficient clothes washer[17].

<u>Per Unit Savings</u>[18,19,20,21]

Product Class	Clothes Washer (ΔkWh_{washer})	Elec. DHW (ΔkWh_{wh})	Gas DHW ($\Delta therm_{wh}$)	Elec. Dryer (ΔkWh_{dryer})	Gas Dryer ($\Delta therm_{dryer}$)
ENERGY STAR Front Load Washer ≤ 2.5 ft^3	4	15	0.7	19	0.7
ENERGY STAR Front Load Washer > 2.5 ft^3	6	35	1.6	169	6.5
ENERGY STAR Top Load Washer ≤ 2.5 ft^3	4	17	0.8	75	2.9

CEE Advanced Tier Top Load Washer > 2.5 ft^3	21	85	3.9	264	10.1

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.029.[22]

Baseline Efficiencies from which Savings are Calculated

Clothes washers manufactured and distributed in commerce, as defined by 42 U.S.C. 6291(16), after January 1, 2018, must meet the energy conservation standards shown in the table below, as specified in the Code of Federal Regulations.[23]

Product Class	IMEF	IWF
Top-loading, Compact (< 1.6 ft^3)	≥ 1.15	≤ 12.0
Top-loading, Standard (≥ 1.6 ft^3)	≥ 1.57	≤ 6.5
Front-loading, Compact (< 1.6 ft^3)	≥ 1.13	≤ 8.3
Front-loading, Standard (≥ 1.6 ft^3)	≥ 1.84	≤ 4.7

Compliance Efficiency from which Incentives are Calculated

For ENERGY STAR® qualified eligibility, clothes washers must be front or top-loading with capacities greater than 1.6 ft^3 and less than 8.0 ft^3 and not designated as Combination All-In One Washer-Dryers or Residential Clothes Washers with Heating Drying Functionality.[24] Additional qualifying product criteria are provided in the table below in order to capture anticipated savings associated with higher efficiency models. The highest efficiency "Product Class" that the

[22] Based on metered data from Navigant Consulting, "EmPOWER Maryland Draft Final Evaluation Report Evaluation Year 4 (6/1/2012 – 5/31/2013) Appliance Rebate Program." March 2014, page 36. This report is not publicly available, but is referenced by the Mid-Atlantic Technical Reference Manual, Version 7.0, May 2017.
[23] 10 CFR 430.32(g)(4)
[24] ENERGY STAR® Program Requirements Product Specification for Clothes Washers

qualifying unit is eligible for should be used to establish savings from the Per Unit Savings table above.

ENERGY STAR® [25] and Consortium for Energy Efficiency (CEE)[26] Product Criteria Levels are shown in the table below:

Product Class	IMEF	IWF
ENERGY STAR Clothes Washer ≤ 2.5 ft^3	≥ 2.07	≤ 4.2
ENERGY STAR Front Load Washer > 2.5 ft^3	≥ 2.76	≤ 3.2
ENERGY STAR Top Load Washer > 2.5 ft^3	≥ 2.06	≤ 4.3
ENERGY STAR Most Efficient Washer ≤ 2.5 ft^3	≥ 2.20	≤ 3.7
ENERGY STAR Most Efficient Washer > 2.5 ft^3	≥ 2.92	≤ 3.2
CEE Tier 1 Clothes Washer ≤ 2.5 ft^3	≥ 2.07	≤ 4.2
CEE Tier 1 Clothes Washer > 2.5 ft^3	≥ 2.76	≤ 3.2
CEE Tier 2 Clothes Washer ≤ 2.5 ft^3	≥ 2.20	≤ 3.7
CEE Tier 2 Clothes Washer > 2.5 ft^3	≥ 2.92	≤ 3.2
CEE Advanced Tier Clothes Washer > 2.5 ft^3	≥ 3.10	≤ 3.0

Operating Hours

An average of 295 annual one-hour active wash cycles is assumed in order to estimate conventional and qualifying unit consumption and demand savings.[27]

Effective Useful Life (EUL)

See Appendix P.

Ancillary Fossil Fuel Savings Impacts

High efficiency clothes washers more effectively remove moisture from clothing during spin cycles. This reduces the amount of time necessary for drying cycles and leads to energy savings. Clothes dryer energy savings are considered in overall energy savings calculations above.

Ancillary Electric Savings Impacts

High efficiency clothes washers more effectively remove moisture from clothing during spin cycles. This reduces the amount of time necessary for drying cycles and leads to energy savings. Clothes dryer energy savings are considered in overall energy savings calculations above.

CLOTHES DRYER

Measure Description

This measure covers residential grade clothes dryers meeting the criteria established under the ENERGY STAR® Program, Version 1.1, effective May 5, 2017 installed in residential settings.[28] ENERGY STAR® clothes dryers have a higher combined energy factor (CEF), and save energy through a combination of more efficient drying and reduced runtime of the drying cycle. More efficient drying is achieved through increased insulation, modifying operating conditions, improving air circulation, and improved efficiency of motors. Reduced dryer runtime is achieved through automatic termination of the dryer cycles based on temperature and moisture sensors. Clothes dryers originally qualified for the ENERGY STAR® label in May 2014. Clothes dryers that have earned this label are approximately 20% more efficient than non-qualified models.[29]

This measure applies to clothes dryers installed in single family homes and in-unit multifamily equipment. For residential grade clothes dryers installed in multifamily common areas, the Commercial and Industrial Clothes Dryer measure prescribed in the NY TRM shall be used.

The algorithms, inputs, and savings presented below assume a normal replacement scenario.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times Cycles_{annual} \times Load \times \left[\frac{F_{elec,baseline}}{CEF_{baseline}} - \frac{F_{elec,ee}}{CEF_{ee}}\right]$$

Peak Coincident Demand Savings

$$\Delta kW = \frac{\Delta kWh}{hrs} \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times Cycles_{annual} \times Load \times \left[\frac{F_{gas,baseline}}{CEF_{baseline}} - \frac{\times F_{gas,ee}}{CEF_{ee}}\right] \times \frac{3{,}412}{100{,}000}$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
$Cycles_{annual}$	= Number of dryer cycles per year
Load	= Average total weight (lbs) of clothes per drying cycle

---

[28] ENERGY STAR® Program Requirements Product Specification for Clothes Dryers, Eligibility Criteria Version 1.1, May 2017

[29] Efficiency of ENERGY STAR® products: https://www.energystar.gov/products/appliances/clothes_dryers

baseline	= Baseline condition or measure
ee	= Energy efficient condition or measure
F_{elec}	= Percentage of energy consumed that is derived from electricity
F_{gas}	= Percentage of energy consumed that is derived from gas
CEF	= Combined energy factor (lb/kWh)
hrs	= Annual run hours of clothes dryer
CF	= Coincidence Factor
3,412	= Conversion factor, one kWh equals 3,412 BTU
100,000	= Conversion factor (BTU/therm), one therm equals 100,000 BTU

Hrs	290	290	290	290	290

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.042.[39]

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a standard efficiency, residential grade clothes dryer with operating specifications as defined in the Key Variables Lookup Table above.

Compliance Efficiency from which Incentives are Calculated

The compliance condition is a residential grade clothes dryer appearing on the ENERGY STAR® qualified products list.

Operating Hours

Operating hours for residential clothes dryers are provided in the Key Variables Lookup Table above.

Effective Useful Life (EUL)

See Appendix P.

Ancillary Fossil Fuel Savings Impacts

A clothes dryer releases heat to the surrounding environment. Conventional vented dryers also vent air outside the building. The associated HVAC impact of dryers depends upon a number of variables including climate and placement of a dryer (i.e., in a conditioned or unconditioned space). It is an area of ongoing research.[40] These impacts are excluded from the methodology prescribed herein until they can be quantified and substantiated through independent research.

Ancillary Electric Savings Impacts

See Ancillary Fossil Fuel Savings Impacts section above.

DEHUMIDIFIER

Measure Description

This measure covers the installation of residential stand-alone or whole-house dehumidifiers meeting the minimum qualifying efficiency standards established under the ENERGY STAR® Program, Version 4.0, effective October 25, 2016.[41] With a higher Energy Factor than comparable non-qualified models, ENERGY STAR® dehumidifiers have more efficient refrigeration coils, compressors, and fans that use less energy to remove moisture in residential buildings. Dehumidifiers originally qualified for the ENERGY STAR® label in January 2001. Dehumidifiers that have earned this label are approximately 15% more efficient than non-qualified models. This measure is restricted to dehumidifiers with a product moisture removal capacity of less than or equal to 185 pints/day.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times \frac{pints/day \times 0.473 \times hrs}{24} \times \left(\frac{1}{EF_{baseline}} - \frac{1}{EF_{ee}}\right)$$

Peak Coincident Demand Savings

$$\Delta kW = \frac{\Delta kWh}{hrs} \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
pints/day = Product capacity to remove moisture (pints/day)
hrs = Annual run hours of dehumidifier
baseline = Baseline condition or measure
ee = Energy efficient condition or measure
EF = Energy Factor (prior to June 13, 2019) or Integrated Energy Factor (on or after June 13, 2019)
CF = Coincidence factor
0.473 = Conversion factor (liters/pint)
24 = Hours in one day

[41] ENERGY STAR® Program Requirements Product Specification for Dehumidifiers, Eligibility Criteria Version 4.0, February 2016

Summary of Variables and Data Sources

Variable	Value	Notes
pints/day		From application.
$EF_{baseline}$		Look up based on type and product capacity (pints/day) or case volume from Baseline Efficiencies section below. Note that the same rating metric (Energy Factor or Integrated Energy Factor) must be used for the baseline and energy efficient case to estimate savings.
EF_{ee}		From application, or look up based on product capacity (pints/day) in Compliance Efficiency section below. Note that the same rating metric (Energy Factor or Integrated Energy Factor) must be used for the baseline and energy efficient case to estimate savings.
hrs	1,632	Assumes 68 days of 24-hour operation.[42]
CF	0.56	

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.56.[43]

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a stand-alone or whole-house dehumidifier meeting the minimum effective federal standard for performance. Dehumidifiers manufactured and distributed in commerce on or after October 1, 2012 and before June 13, 2019 must meet the energy conservation standards shown in the table below, rated in Energy Factor, as specified in the Code of Federal Regulations.[44]

Product Capacity (pints/day)	Energy Factor (liters/kWh)
≤ 35	1.35
> 35 to ≤ 45	1.50
> 45 to ≤ 54	1.60
> 54 to ≤ 75	1.70
> 75 to ≤ 185	2.50

Dehumidifiers manufactured and distributed in commerce on or after June 13, 2019 must meet the energy conservation standards shown in the tables below, rated in Integrated Energy Factor as specified in the Code of Federal Regulations.[45]

[42] Savings Calculator for ENERGY STAR® Qualified Appliances (accessed 1/18/2018)
[43] A. Mendyk & D. Cautley, Dehumidifier Metering Study, Home Energy, January 2011: Summer duty cycle used as a proxy for CF.
[44] 10 CFR 430.32(v)(1)
[45] 10 CFR 430.32(v)(2)

Stand-Alone Dehumidifiers	
Product Capacity (pints/day)	**Integrated Energy Factor (liters/kWh)**
≤ 25	1.30
> 25 to ≤ 50	1.60
> 50	2.80

Whole-House Dehumidifiers	
Product Case Volume (ft^3)	**Integrated Energy Factor (liters/kWh)**
≤ 8.0	1.77
> 8.0	2.41

Compliance Efficiency from which Incentives are Calculated

The compliance condition is an ENERGY STAR® qualified stand-alone or whole-house dehumidifier. Prior to June 13, 2019, the compliance equipment's Energy Factor shall be taken from the application. If the equipment Energy Factor is unknown, ENERGY STAR® minimum qualifying specifications, as shown in the table below, may be used.[46]

Product Capacity (pints/day)	Energy Factor (liters/kWh)
< 75	2.00
≥ 75 to ≤ 185	2.80

On or after June 13, 2019, the compliance equipment's Integrated Energy Factor, which must exceed the performance metric of the baseline equipment, shall be taken from the application. To date, ENERGY STAR® qualifying criteria rated in Integrated Energy Factor have not been published. Until an updated ENERGY STAR® specification for dehumidifiers takes effect, the compliance condition Integrated Energy Factor must be taken from the application. Default values from future ENERGY STAR® qualifying product criteria may be used once effective. Until this measure can be updated to reflect these new standards, visit www.energystar.gov/ to check for updated eligibility specifications.

Operating Hours

The dehumidifier is assumed to be operating 1,632 hours per year based on 68 days of 24 hour operation.[47]

Effective Useful Life (EUL)

See Appendix P.

AIR PURIFIER (CLEANER)

Measure Description

Room air purifiers - sometimes referred to as "room air cleaners" - are portable, electric appliances that remove fine particles, such as dust and pollen, from indoor air.[48] This measure applies to air purifiers (cleaners) meeting the minimum qualifying efficiency standards established under the ENERGY STAR® Program.[49]

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta \mathrm{kWh} = \mathrm{units} \times (\mathrm{kWh}_{baseline} - \mathrm{kWh}_{ee})$$

$$\mathrm{kWh}_{ee} = (8{,}760 - Hours) \times \frac{\mathrm{standby}_{ee}}{1{,}000} + Hours \times \frac{CADR}{Eff_{ee} / 1{,}000}$$

$$kWh_{baseline} = (8{,}760 - Hours) \times \frac{standby_{baseline}}{1{,}000} + Hours \times \frac{CADR}{Eff_{baseline} / 1{,}000}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times \left(\frac{\Delta kWh}{Hours}\right) \times CF$$

Annual Gas Energy Savings

$$\Delta Therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
ΔTherms	= Annual gas energy savings
units	= Number of measures installed
ee	= Energy efficient condition or measure, per ENERGY STAR® eligibility criteria
baseline	= Baseline condition or measure
CF	= Coincidence factor
8,760	= Hours per year
standby	= Standby Power (Watts)
CADR	= Clean Air Delivery Rate (CADR), a measure of the amount of contaminant-free air delivered by the qualified air purifier (cubic feet per minute)[2]

[48] ENERGY STAR® Air Purifiers (Cleaners): https://www.energystar.gov/products/appliances/air_purifiers_cleaners/

[49] ENERGY STAR® Product Specification for Room Air Cleaners, Eligibility Criteria, V1.2, July 2011

Eff = Efficiency (dust CADR/Watt); the ENERGY STAR® specification for room air purifiers measures energy efficiency by using a Clean Air Delivery Rate-to-Watt ratio.[50]
Hours = Operating hours per year
1,000 = Conversion from W to kW

Summary of Variables & Data Sources

Variable	Value	Notes
CADR		Based on ENERGY STAR® manufacture rating
Eff_{estar}		Based on ENERGY STAR® manufacture rating (CADR/Watt)
$Eff_{baseline}$	1.0	CADR/Watt
$standby_{estar}$		Based on ENERGY STAR® manufacture rating (Watts)
$standby_{baseline}$	1.0	Watts
Hours	5,840	Based on ENERGY STAR® Calculator default assumptions[51]
CF	0.67	Assumes equal likelihood of usage at any time of day (16/24 hours)

Ratings are based on ENERGY STAR® Eligibility Criteria and the Savings Calculator for ENERGY STAR® Qualified Appliances.[4]

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.67.

Baseline Efficiencies from which Savings are Calculated

The baseline equipment is assumed to have an *Eff* of 1.0 CADR/Watt and a *standby* power of 1.0 Watts (from the ENERGY STAR® calculator default assumptions).

Compliance Efficiency from which Incentives are Calculated

Compliance requires a minimum *Eff* of 2.0 CADR/Watt and maximum *standby* power of 2.0 Watts per the ENERGY STAR® Product Specification for Room Air Cleaners. Additionally, qualified equipment must produce a minimum 50 CADR for dust, measured according to guidance provided in the latest ANSI/AHAM AC-1. Qualifying models that perform secondary consumer functions (e.g. clock, remote control) must meet the standby power requirement.[3]

Operating Hours

The energy savings calculations use 16 hours of operation per day, 365 days a year, totaling 5,840 hours/year, per the Savings Calculator for ENERGY STAR® Qualified Appliances.

REFRIGERATOR AND FREEZER REPLACEMENT

Measure Description

This measure covers the replacement of inefficient residential grade refrigerators and freezers with ENERGY STAR® compliant equipment. Residential refrigerators and freezers include electric refrigerators, electric refrigerator-freezers, and freezers, having a source of refrigeration requiring single phase, alternating current electric energy input only. Known collectively as "refrigeration products," these appliances chill and preserve food and beverages, provide ice and chilled water, and freeze food.

This measure does not apply to refrigerators and refrigerator-freezers with a total refrigerated volume exceeding 39 cubic feet or freezers with a total refrigerated volume exceeding 30 cubic feet.[52]

Savings are calculated between the energy consumption of the baseline unit and that of the more efficient replacement meeting ENERGY STAR® minimum performance specification of at least 10% lower energy consumption than that mandated by federal standards.[53]

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times (kWh_{baseline} - kWh_{ee}) \times (1 + HVAC_c) \times F_{occ}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times \left[\frac{kWh_{baseline} - kWh_{ee}}{8{,}760}\right] \times (1 + HVAC_d) \times CF$$

Annual Gas Energy Savings

$$\Delta therm = units \times (kWh_{baseline} - kWh_{ee}) \times HVAC_g \times F_{occ}$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherm	= Annual gas energy savings
units	= Number of measures installed under the program
baseline	= Baseline condition or measure
ee	= Energy efficient condition or measure
kWh	= Annual electric energy consumption
$HVAC_c$	= HVAC interaction factor for annual electric energy consumption
$HVAC_d$	= HVAC interaction factor at utility summer peak hour
$HVAC_g$	= HVAC interaction factor for annual natural gas consumption

[52] 10 CFR 430.32(a)
[53] Energy Star Refrigerators & Freezers Key Product Criteria

F_{occ} = Adjustment factor to account for number of occupants
CF = Coincidence factor
8,760 = Hours in one year

Summary of Variables and Data Sources

Variable	Value	Notes
$kWh_{baseline}$		See Baseline Efficiencies section below.
kWh_{ee}		From application.
F_{occ}		See Occupant Adjustment Factor section below.
$HVAC_c$		HVAC interaction factor for annual electric energy consumption (dimensionless). Vintage and HVAC type weighted average by city. If unknown, assume Single Family Home building type, New vintage, and AC with Gas Heat HVAC type. See Appendix D.
$HVAC_d$		HVAC interaction factor for peak demand at utility summer peak hour (dimensionless). Vintage and HVAC type weighted average by city. If unknown, assume Single Family Home building type, New vintage, and AC with Gas Heat HVAC type. See Appendix D.
$HVAC_g$		HVAC interaction factor for annual natural gas energy consumption (therms/kWh). Vintage and HVAC type weighted average by city. If unknown, assume Single Family Home building type, New vintage, and AC with Gas Heat HVAC type. See Appendix D.
CF	1.0	

Occupant Adjustment Factor (F_{occ})

The occupant adjustment factor is used to adjust the energy savings according to the number of occupants in the residence (if applicable), as shown in the table below. If unknown, apply 0 occupants as a default value.

Number of Occupants	F_{occ}[54]
0 occupants	1.00
1 occupant	1.05
2 occupants	1.10
3 occupants	1.13
4 occupants	1.15
5 or more	1.16

Coincidence Factor (CF)

The recommended value for the coincidence factor is 1.0.[55]

[54] The Occupant Adjustment Factor is developed from simulating audits within the ORNL weatherization tool, National Energy Audit Tool (NEAT), Oak Ridge National Laboratory, 2012.
[55] *No source specified – update pending availability and review of applicable references.*

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a minimally code compliant refrigerator, refrigerator-freezer or freezer as defined in the Measure Description section above. Baseline annual electric consumption (kWh/yr) shall align with federally mandated maximum energy use associated with the Product Class and Adjusted Volume (AV in ft^3 or av in L) of the qualifying equipment. Federal standard annual electric consumption data is provided in the directory of ENERGY STAR® qualified Refrigerators[56] and Freezers[57] according to the make and model of the qualifying equipment. The values specified by ENERGY STAR® incorporate conversion from total capacity to Adjusted Volume as dictated by the Code of Federal Regulations.[58] For this reason, $kWh_{baseline}$ must be determined from the ENERGY STAR® directory.

Compliance Efficiency from which Incentives are Calculated

The compliance condition is an ENERGY STAR® qualified refrigerator, refrigerator-freezer or freezer as defined in the Measure Description section above. Annual energy consumption of the compliance condition shall be determined from the directory of ENERGY STAR® qualified Refrigerators[59] and Freezers[60] according to the make and model of the qualifying equipment.

Operating Hours

Refrigeration products are assumed to be plugged into an electrical outlet 8,760 hours per year. Compressor cycling is inherent in the specified annual energy consumption of baseline and qualifying equipment.

Effective Useful Life (EUL)

See Appendix P.

Ancillary Fossil Fuel Savings Impacts

High-efficiency refrigeration products reject less heat into the conditioned space than standard equipment, increasing space heating requirements while decreasing cooling load. The HVAC interaction factors calculated from the prototypical building DOE-2 models as a function of the building and HVAC system type are shown in Appendix D.

Ancillary Electric Savings Impacts

High-efficiency refrigeration products reject less heat into the conditioned space than standard equipment, increasing space heating requirements while decreasing cooling load. The HVAC

APPLIANCE – CONTROL

ADVANCED POWER STRIP

Measure Description

This measure covers the installation of Tier 1 and Tier 2 advanced power strips (APS) installed in home entertainment centers (AV Equipment) and home offices (IT Equipment). An APS reduces energy consumption by shutting off the supply power to electronic devices when they are not in active use. This measure applies to power strips with 5 outlets or more.

Tier 1 APS, also known as master-controlled APS, are designed to reduce standby energy waste by monitoring the power state of a master device (typically a TV or desktop computer) using current-sensing technology and cutting power to controlled (or switched) devices when the master device is off. This reduces the energy and power consumption of interconnected equipment (i.e. entertainment centers and home offices) by eliminating standby loads and consumption of devices left on but not in use. Tier 1 APS applies to both home office and entertainment center equipment.

Tier 2 APS reduce active and standby energy waste by monitoring user engagement and cutting power to all devices when a set period of inactivity is detected. This is accomplished through the use of infrared (IR) sensing and motion-sensing technology, in addition to the master/switched capability of a Tier 1 APS. Active power waste occurs when electronic equipment is on, but the equipment is not being used. Standby power loss occurs when energy is consumed by equipment while it is turned off and in idle mode, but is still plugged in. Tier 2 APS realize savings by reducing both active and standby power loss, which can provide significant energy savings over a Tier 1 Advanced Power Strip. For the purposes of this measure, Tier 2 APS apply to entertainment center equipment only; there are no claimable incremental savings associated with installation of a Tier 2 APS in a home office.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times (\Delta kWh/unit)$$

Peak Coincident Demand Savings

$$\Delta kW = \frac{\Delta kWh}{hrs_{off}} \times CF$$

Annual Gas Energy Savings

$$\Delta Therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings

units = Number of measures installed under the program
(ΔkWh/unit) = Annual electric energy savings per unit
hrs_{off} = Annual hours that the connected system is not in use or is turned off
CF = Coincidence Factor

Summary of Variables & Data Sources

Variable	Value	Notes
(ΔkWh/unit)		Lookup based on tier, connected equipment type and existing condition in Annual Electric Energy Savings per Unit table below.
hrs_{off}	Tier 1: 7,340 Tier 2: 8,048	See Operating Hours section below
CF	0.8	

<u>Annual Electric Energy Savings per Unit (ΔkWh/unit)</u>

Annual electric energy savings are shown in the table below, where the Baseline condition is equivalent to the existing case and Connected Equipment is the type of equipment to be controlled with the installed APS. Unknown designations are provided for use in retailer or online market place point-of-sale programs, in which the application or existing condition is unknown.

APS Tier	Connected Equipment	Baseline	ΔkWh/unit
Tier 1	AV Equipment	Standard Power Strip	75.1[61]
Tier 1	IT Equipment	Standard Power Strip	31[62]
Tier 1	Unknown	Standard Power Strip	57.5[63]
Tier 2	AV Equipment	Standard Power Strip	234[64]
Tier 2	AV Equipment	Tier 1 Power Strip	158.9[65]
Tier 2	AV Equipment	Unknown	158.9[66]

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.8.[67]

Baseline System from which Savings are Calculated

The baseline condition for Tier 1 APS is AV or IT equipment plugged into a standard power strip. The baseline condition for Tier 2 APS is AV equipment plugged into either a standard power strip or Tier 1 APS.

[61] New York State Energy Research and Development Authority, Advanced Power Strip Research Report, August 2011, p. 30.
[62] Ibid.
[63] Ibid, p. 7. Calculated with weighted average where 60% of Tier 1 APS applications are used for AV equipment and 40% for IT and other smaller load applications.
[64] San Diego Gas & Electric, Tier 2 Advanced Power Strips in Residential and Commercial Applications, April 2015, p. 3
[65] Ibid. Calculated as incremental savings over a Tier 1 APS (234 – 75.1 = 158.9 kWh).
[66] Ibid. Conservatively assumes savings associated with replacement of a Tier 1 APS.
[67] *No source specified – update pending availability and review of applicable references.*

Compliance Efficiency from which Incentives are Calculated

The compliance condition is a Tier 1 or Tier 2 APS as defined in the Measure Description above meeting minimum performance requirements dictated by program eligibility criteria.

Operating Hours

Power strips are assumed to be plugged in at all times. The hrs_{off} term used above for the purposes of estimating peak coincident demand savings adopts a usage profile associated with AV equipment, as this provides the most conservative demand savings estimate. This equipment is assumed to be off for 20.11 hours per day and on but not in use for 1.94 hours per day.[68] For Tier 1 APS, only off hours lead to savings, thus the operating hours are 365 x 20.11 = 7,340. Savings are achieved for Tier 2 APS when equipment is off or on but not in use. Thus, the hours of operation used to determine demand savings are 365 x (20.11 + 1.94) = 8,048. No savings are achieved during the remaining 712 hours per year when equipment is in active use. This reporting of AV off hours aligns well with the NYSERDA APS research study, which found television off hours to be 19.1 per day in New York State.[69]

APPLIANCE RECYCLING

AIR CONDITIONER – ROOM (RAC) RECYCLING

Measure Description

In many cases where an air conditioning unit is replaced by a homeowner, the existing unit is retained, sold, or donated for use elsewhere and represents additional load on the grid. This measure covers recycling of the existing functional equipment, thereby eliminating the consumption associated with that equipment. Air conditioner recycling programs (also called "bounty" programs) receive energy savings credit for permanently removing inefficient functional air conditioners from the electric grid. Only recycled equipment 5 years old or older are eligible for energy savings claims.

This measure covers the recycling of inefficient room air conditioners in residential applications. A room air conditioner is a consumer product, other than a "packaged terminal air conditioner," which is powered by a single phase electric current and which is an encased assembly designed as a unit for mounting in a window or through the wall for the purpose of providing delivery of conditioned air to an enclosed space. It includes a prime source of refrigeration and may include a means for ventilating and heating.[70]

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times \frac{BTUh/unit}{1{,}000} \times \frac{1}{CEER_{baseline}} \times EFLH_{cooling}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times \frac{BTUh/unit}{1{,}000} \times \frac{1}{CEER_{baseline}} \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
BTUh/unit	= British Thermal Units per hour of air conditioning per unit
baseline	= Baseline condition or measure
CEER	= Combined Energy Efficiency Ratio
EFLH	= Equivalent full-load hours

[70] 10 CFR 430.2

CF = Coincidence factor
1,000 = Conversion factor, one kW equals 1,000 Watts

Summary of Variables and Data Sources

Variable	Value	Notes
BTUh/unit		From application, or use 7,829 as default.[71]
$CEER_{baseline}$		If known, use the nameplate efficiency of the recycled equipment, from application. Nameplate EER may be converted to CEER by dividing EER by 1.01 (EER/1.01 = CEER).[72] If unknown, see Baseline Efficiencies section below.
$EFLH_{cooling}$		Cooling equivalent full-load hours, lookup from Operating Hours section below based on location.
CF	0.3	

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.3.[73] The average Seasonal CF based on 2007 weather data used for this measure aligns with results of a sampling study conducted in Con Edison territory, citing a CF = 0.31.[74]

Baseline Efficiencies from which Savings are Calculated

The baseline condition is equivalent to the existing equipment. $CEER_{baseline}$ shall be set equal to the nameplate efficiency of the existing unit, converted from EER to CEER via the conversion CEER = EER/1.01, if necessary. If nameplate efficiency is unavailable, use the rated efficiency ratio based on recycled equipment type and capacity per the table below.

The CEER values listed in the table below reflect the minimum performance required by the Code of Federal Regulations effective October 1, 2000 to May 31, 2014.[75]

REFRIGERATOR AND FREEZER RECYCLING

Measure Description

In many cases, when a refrigerator or freezer is replaced by a homeowner, the existing unit is retained, sold or donated for use elsewhere, representing additional load on the grid. This measure covers recycling of the existing, functional equipment, thereby eliminating the consumption associated with that equipment. Refrigerator and freezer recycling programs (also called "bounty" programs) receive energy savings credit for permanently removing inefficient, functional refrigerators and freezers from the electric grid.

This measure covers the recycling of primary (i.e. installed in a kitchen) and secondary (i.e. installed elsewhere) refrigerators, refrigerator-freezers and freezers. To account for the fact that secondary equipment is occasionally installed and operating for only part of the year, a part-time use adjustment factor has been applied to the annual gross savings for secondary units to establish average per unit deemed electric savings.

This measure does not cover the recycling of equipment classified by the Code of Federal Regulations as "Compact refrigerator/refrigerator-freezer/freezer". This refers to any refrigerator, refrigerator-freezer or freezer with a total refrigerated volume of less than 7.75 cubic feet (220 liters), where the total refrigerated volume has been determined in accordance with the procedure prescribed in Appendix A (refrigerators and refrigerator-freezers) or B (freezers) of 10 CFR 430 Subpart B.[77]

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times (\Delta kWh/unit)$$

Peak Coincident Demand Savings

$$\Delta kW = units \times \Delta kWh/8{,}760 \times TAF \times LSAF \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
(ΔkWh/unit)	= Gross deemed annual electric savings per unit
TAF	= Temperature Adjustment Factor
LSAF	= Load Shape Adjustment Factor
CF	= Coincidence Factor
8,760	= Hours in one year

Summary of Variables and Data Sources

There are several conditions that impact the estimated savings available from a refrigerator and/or freezer-recycling program. Factors such as the average type, make, model, size, and age of units recycled significantly impact the savings. Variances in these conditions have a significant impact of the level of savings that can be achieved. In addition, the average number of hours these units are plugged in and operating impact savings. Likewise, the environmental and operational conditions also impact the energy savings. These variables make establishing a projected engineering based calculation approach for per unit savings a complex task that is prone to error because of the effects of the compounding uncertainty associated with the potential variance within each of the key estimation variables. However, savings projections in this Tech Manual are based on impact evaluations completed in New York State.

The following deemed energy impact estimates shall be used in New York for refrigerator and freezer recycling programs.

Variable	Value	Notes
(ΔkWh/unit)	Primary Refrigerator – 1,218[78] Secondary Refrigerator – 794[79] Freezer - 846[80]	
TAF	1.22	Temperature Adjustment Factor; reflects load variance during summer peak due to increased ambient temperature conditions.[81]
LSAF	1.06	Load Shape Adjustment Factor; reflects the instantaneous differential from annual average load coincident with peak.[82]
CF	1.0	

Coincidence Factor (CF)

The recommended value for the coincidence factor is 1.0.[83]

Baseline Efficiencies from which Savings are Calculated

The savings calculations above apply to recycling of a functioning primary[84] or secondary refrigerator, refrigerator-freezer or freezer with total refrigerated volume of 7.75 cubic feet (220 liters) or more.

Compliance Efficiency from which Incentives are Calculated

N/A

Operating Hours

Primary refrigerators or freezers are assumed to be connected to an electrical outlet 8,760 hours per year. Secondary units may only be connected part-time, but 8,760 hours per year is utilized in these cases as well for the sake of establishing conservative estimates of peak coincident demand savings.

Effective Useful Life (EUL)

See Appendix P.

BUILDING SHELL

AIR LEAKAGE SEALING

Measure Description

Reduction in the natural infiltration rate of the home through sealing air leaks in the building envelope. These algorithms are used for single-family and smaller multi-family buildings where the use of a blower door is feasible. An alternate method for estimating savings that is based on the building's heated square footage is also provided for larger multi-family buildings.
Method for Calculating Annual Energy and Peak Coincident Demand Savings

(with blower door test)

Annual Electric Energy Savings

$$\Delta kWh = units \times \left(\frac{\Delta CFM_{50}}{n-factor}\right) \times \left(\frac{\Delta kWh}{CFM}\right) \times \left(\frac{SEER_{baseline}}{SEER_{part}}\right) \times \left[\frac{\bar{\eta}_{dist,baseline}}{\bar{\eta}_{dist,part}}\right]_{cooling}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times \left(\frac{\Delta CFM_{50}}{n-factor}\right) \times \left(\frac{\Delta kW}{CFM}\right) \times \left(\frac{EER_{baseline}}{\overline{EER}_{part}}\right) \times \left[\frac{\eta_{dist,pk,baseline}}{\eta_{dist,pk,part}}\right]_{cooling} \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times \left(\frac{\Delta CFM_{50}}{n-factor}\right) \times \left(\frac{\Delta therm}{CFM}\right) \times \left(\frac{AFUE_{baseline}}{AFUE_{part}}\right) \times \left[\frac{\bar{\eta}_{dist,baseline}}{\bar{\eta}_{dist,part}}\right]_{heating}$$

Method for Calculating Annual Energy and Peak Coincident Demand Savings
(without blower door test)

Annual Electric Energy Savings

$$\Delta kWh = units \times floor\ area\ (1{,}000\ ft^2) \times \left(\frac{\Delta kWh}{1000\ ft^2}\right)$$

Peak Coincident Demand Savings

$$\Delta kW = \text{units} \times \text{floor area } (1{,}000\ ft^2) \times \left(\frac{\Delta kW}{1000\ ft^2}\right) \times CF$$

Annual Gas Energy Savings

$$\Delta therm = \text{units} \times \text{floor area } (1{,}000\ ft^2) \times \left(\frac{\Delta therm}{1000\ ft^2}\right)$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherm	= Annual gas energy savings
units	= Number of measures installed under the program
AFUE	= Annual fuel utilization efficiency
CFM	= Cubic feet per minute
SEER	= Seasonal average energy efficiency ratio over the cooling season, BTU/watt-hour, (used for average U.S. location/region)
EER	= Energy efficiency ratio under peak conditions
$\overline{EER}$	= Seasonal average energy efficiency ratio over the cooling season BTU/watt-hour, (used for a particular climate/building)
CF	= Coincidence factor
n-factor	= Correction factor
η	= Energy efficiency (0 -100%)
$\overline{\eta}$	= Average energy efficiency (0 -100%)
$_{part}$	= Participant
$_{dist}$	= Distribution
$_{pk}$	= Peak
$_{baseline}$	= Baseline condition or measure
Δ	= Change, difference, or savings
ft^2	= Square foot
floor area	= Conditioned floor area

Summary of Variables and Data Sources

Variable	Value	Notes
Floor area		From application
ΔCFM_{50}		change in infiltration rate (cfm) at measured 50 Pa
ΔkWh/CFM		From prototype simulations, HVAC type weighted average by city. Use actual CFM_{50} reduction from blower door test.
ΔkW/CFM		From prototype simulations, HVAC type weighted average by city. Use actual CFM_{50} reduction from blower door test.
Δtherm/CFM		From prototype simulations, HVAC type weighted average by city. Use actual CFM_{50} reduction from blower door test.
n-factor	15	2 story home with normal wind exposure in NY climate
$1{,}000ft^2$		1,000 ft^2 of conditioned floor area
$\Delta kWh/1{,}000ft^2$		From prototype simulations, Vintage and HVAC type weighted average by city.
$\Delta kW/1{,}000ft^2$		From prototype simulations, Vintage and HVAC type weighted average by city.
Δ therm/$1{,}000ft^2$		From prototype simulations, Vintage and HVAC type weighted average by city.
$EER_{baseline}$	11.1	
$\overline{EER}_{part}$		Participant population average, defaults to $EER_{baseline}$ (no adjustment)
$SEER_{baseline}$	13	
$SEER_{part}$		Participant population average, Defaults to $SEER_{baseline}$ (no adjustment)
$AFUE_{baseline}$	78%	
$AFUE_{part}$		Participant population average, Defaults to $AFUE_{baseline}$ (no adjustment)
$\overline{\eta}_{dist,\ baseline}$	0.956	
$\overline{\eta}_{dist,\ part}$		Distribution system efficiency under peak conditions within participant population, participant population average defaults to $\overline{\eta}_{dist,\ baseline}$.(no adjustment)
$\eta_{dist,\ pk,\ baseline}$	0.956	Distribution system efficiency under peak conditions used in simulation
$\eta_{dist,\ pk,\ part}$		Participant population average, defaults to $\eta_{dist,\ pk,\ baseline}$ (no adjustment)

Unit energy and demand savings calculated from the building prototype simulation models are shown in Appendix E. The savings normalized to infiltration rate reduction are tabulated by building type, location, and HVAC system type. The savings normalized per square foot of floor area are tabulated by building type, vintage, and HVAC system type.

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.8

Baseline Efficiencies from which Savings are Calculated

Baseline natural infiltration rate is assumed be one air change per hour (ACH) for old vintage homes, and 0.5 ACH for average vintage homes.

Compliance Efficiency from which Incentives are Calculated

See Appendix E.

Operating Hours

The energy savings for insulation are dependent on the HVAC system operating hours and thermostat set points. See Appendix A for the modeling assumptions for each building prototype.

HOT WATER PIPE INSULATION

Measure Description

This section covers pipe insulation in space heating and domestic hot water (DHW) system distribution system applications. The savings depend on the type and size of the pipe, insulation type and thickness, hot water temperature and piping system ambient temperature.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times L \times \frac{\left[(UA/L)_{baseline} - (UA/L)_{ee}\right]}{\eta_h \times 3{,}412} \times \overline{\Delta T} \times hr$$

Peak Coincident Demand Savings

$$\Delta kW = units \times L \times \frac{\left[(UA/L)_{baseline} - (UA/L)_{ee}\right]}{\eta_h \times 3{,}412} \times \Delta T \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times L \times \frac{\left[(UA/L)_{baseline} - (UA/L)_{ee}\right]}{\eta_h \times 100{,}000} \times \overline{\Delta T} \times hr$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
CF	= Coincidence factor
L	= Length
Δ	= Change, difference, or savings
T	= Temperature
$\overline{\Delta T}$	= Average temperature difference
baseline	= Baseline condition or baseline measure
ee	= Energy efficient
h	= Heater
UA/L	= Heat loss coefficient (BTU/hr-°F)
3,412	= Conversion factor, one kW equals 3,412.14 BTU/h
8,760	= Hours in one year
100,000	= Conversion factor (BTU/therm), one therm equals 100,000 BTU's

Summary of Variables and Data Sources

Variable	Value	Notes
L	From application	Length of insulation installed
difference between water within the pipe and air under peak conditions;		
ΔT	60°F (service hot water) 100°F (hot water heat) 130°F (steam heat)	Temperature difference between the hot water in the pipe and surrounding air temperature (°F); 130°F hot water temp, 70°F room temp 160 °F hot water temp, 60°F room temp 190 °F steam temp, 60°F room temp
average temperature(°F) difference between water within the pipe and air temperature;		
$\overline{\Delta T}$	60°F (service hot water) 100°F (hot water heat) 130°F (steam heat)	Average temperature difference between the hot water in the pipe and surrounding air temperature (°F); 130°F hot water temp, 70°F room temp 160 °F hot water temp, 60°F room temp 190 °F steam temp, 60°F room temp
UA/L	From table above	Overall pipe heat loss coefficient per unit length (BTU/hr-°F-ft), value based on pipe size, insulation type and insulation thickness
η_h	0.97 (electric water heater) 0.75 (gas water heater) 0.80 (gas hot water heat) 0.75 (gas steam heat)	
hr	Service hot water: 8760hr Space Heat: $EFLH_{heating}$ (SF and MF low-rise) 3240 (MF high-rise)	$EFLH_{heating}$ from Appendix G.

Coincidence Factor (CF)

The recommended value for the coincidence factor for domestic water heating is 0.8.
The recommended value for the coincidence factor for hydronic space heating is 0.0.

Baseline Efficiencies from which Savings are Calculated

The $UA_{baseline}$ assumes uninsulated copper pipe for water heating applications, and uninsulated copper or steel pipes for space heating applications.

The overall heat transfer coefficient per foot of pipe for the base and improved (insulated) piping is shown in the tables below.

Baseline Uninsulated Pipe Heat Loss Coefficient (UA/L) in BTU/hr-°F-ft

Pipe Size (nominal) (in.)	**Bare Copper Piping**			**Bare Steel Piping**	
	Service Hot Water	Hot water heat	Steam heat	Hot water heat	Steam heat
0.75	0.40	0.45	0.49	0.73	0.78
1	0.50	0.56	0.61	0.89	0.95
1.25	0.59	0.67	0.72	1.10	1.18
1.5	0.68	0.78	0.83	1.24	1.33

4	0.60	0.33	0.24	0.19	0.43	0.24	0.17	0.14

Insulated Steel Pipe Heat Loss Coefficient (UA/L) in BTU/hr-°F-ft

Pipe Size (nominal) (in.)	Fiberglass				Rigid foam			
	0.5 in	1.0 in	1.5 in	2.0 in	0.5 in	1.0 in	1.5 in	2.0 in
0.75	0.20	0.12	0.10	0.08	0.14	0.09	0.07	0.06
1	0.23	0.14	0.11	0.09	0.17	0.10	0.08	0.07
1.25	0.28	0.17	0.13	0.11	0.20	0.12	0.09	0.08
1.5	0.31	0.18	0.14	0.12	0.22	0.13	0.10	0.08
2	0.37	0.21	0.16	0.13	0.27	0.15	0.12	0.10
2.5	0.44	0.25	0.18	0.15	0.32	0.18	0.13	0.11
3	0.52	0.29	0.21	0.17	0.38	0.21	0.15	0.12
4	0.65	0.36	0.26	0.21	0.47	0.26	0.18	0.15

The efficiency of an electric storage type water heater is assumed to be 0.97. The efficiency of a non-condensing storage type water heater is assumed to be 0.75. For space heating applications, the efficiency of a gas hot water boiler is assumed to be 0.80 and the efficiency of a gas steam heating boiler is assumed to be 0.75.

The ambient temperature difference between the water temperature and the ambient room temperature is used to calculate the pipe losses. Water heaters are generally located in conditioned or partially conditioned spaces to avoid freezing. A room temperature of 70°F is the default value. A water heater set point temperature of 130°F is the default value.

Similarly, space-heating boilers are generally located in conditioned or partially conditioned spaces to avoid freezing. A room temperature of 60°F is the default value. An average water temperature of 160°F is the default value for hot water boilers, and an average steam pipe temperature of 190°F is the default value for steam boilers.

Compliance Efficiency from which Incentives are Calculated

The UA_{ee} for insulated pipes was calculated for fiberglass and rigid foam pipe insulation of various thicknesses. Service hot water pipe insulation for non-recirculating systems common in single-family buildings is limited to the first 12 feet of hot water supply pipe leaving the water heater. Recirculating systems common in multi-family buildings should use the full length of installed pipe insulation to calculate savings. Space heating pipe insulation is limited to insulation installed in unheated spaces only.

Insulated pipe losses were calculated using a k value of 0.25 BTU-in/SF-°F for fiberglass and 0.18 BTU-in/SF-°F for rigid foam insulation. Pipe wall resistance and exterior film resistance were neglected.

Operating Hours

The water heater is assumed to be available during all hours. Single-family and multi-family low-rise buildings should use the heating equivalent full-load hours as shown in Appendix G. Systems in high-rise multi-family buildings should use 3240 operating hours per year.

OPAQUE SHELL INSULATION

Measure Description

This measure covers improvements to the thermal conductance of the opaque building shell, which includes upgrading insulation in walls, ceilings, floors, etc. Energy and demand saving are realized through reductions in the building heating and cooling loads.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times ft^2 \times \left(\frac{\Delta kWh}{ft^2}\right) \times \left(\frac{SEER_{baseline}}{SEER_{part}}\right) \times \left[\frac{\overline{\eta}_{dist,baseline}}{\overline{\eta}_{dist,part}}\right]_{cooling}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times ft^2 \times \left(\frac{\Delta kW}{ft^2}\right) \times \left(\frac{EER_{baseline}}{EER_{part}}\right) \times \left[\frac{\eta_{dist,pk,baseline}}{\eta_{dist,pk,part}}\right]_{cooling} \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times ft^2 \times \left(\frac{\Delta therm}{ft^2}\right) \times \left(\frac{AFUE_{baseline}}{AFUE_{part}}\right) \times \left[\frac{\overline{\eta}_{dist,baseline}}{\overline{\eta}_{dist,part}}\right]_{heating}$$

where:

Δ kWh	= Annual electricity energy savings
Δ kW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
ft^2	= Square foot
CF	= Coincidence factor
AFUE	= Annual fuel utilization efficiency
SEER	= Seasonal average energy efficiency ratio over the cooling season, BTU/watt-hour, (used for average U.S. location/region)
EER	= Energy efficiency ratio under peak conditions
$\overline{\eta}$	= Average energy efficiency (0 -100%)
η	= Energy efficiency (0 -100%)
$_{dist}$	= Distribution
$_{baseline}$	= Baseline condition or measure
$_{part}$	= Participant

Summary of Variables and Data Sources

Variable	Value	Notes
ft^2		From application
$\Delta kWh / ft^2$		HVAC type weighted average by city based on the combination of the existing and installed R-value
$\Delta kW / ft^2$		HVAC type weighted average by city based on the combination of the existing and installed R-value
$\Delta therm / ft^2$		HVAC type weighted average by city based on the combination of the existing and installed R-value
$EER_{baseline}$	11.1	
EER_{part}		Participant population average defaults to $EER_{baseline}$ (no adjustment)
$SEER_{baseline}$	13	SEER used in the simulations
$SEER_{part}$		SEER of cooling system within participant population Participant population average defaults to $SEER_{baseline}$ (no adjustment)
$AFUE_{baseline}$	78%	AFUE of heating system within participant population. AFUE used in the simulations
$AFUE_{part}$		Participant population average. Defaults to $AFUE_{baseline}$ (no adjustment)
$\bar{\eta}_{dist, baseline}$	0.956	Distribution system seasonal efficiency used in simulations
$\bar{\eta}_{dist, part}$		Distribution system seasonal efficiency within participant population. Participant population average defaults to $\bar{\eta}_{dist, baseline}$ (no adjustment)
$\eta_{dist, pk, baseline}$	0.956	Distribution system efficiency under peak conditions used in simulation
$\eta_{dist, pk, part}$		Distribution system efficiency under peak conditions within participant population. Participant population average defaults to $\eta_{dist, pk, baseline}$ (no adjustment)

Unit energy and demand savings calculated from the building prototype simulation models are shown in Appendix E. The savings are tabulated by building type and HVAC system type across a range of pre-existing (baseline) and upgraded insulation R-values.

These values can be adjusted to account for heating and cooling system efficiencies that vary from the values used in the simulations. In the absence HVAC system or distribution system efficiency data, no adjustment is made.

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.8

Baseline Efficiencies from which Savings are Calculated

Energy savings over a variety of baseline wall and ceiling insulation levels are listed in Appendix E. The baseline R-value must be captured in the program application. Interpolation of the data in Appendix E is permitted.

Compliance Efficiency from which Incentives are Calculated

Energy savings over a variety of measure wall and ceiling insulation levels are listed in Appendix E. The installed R-value must be captured in the program application. Interpolation of the data in Appendix E is permitted. Note: The data in Appendix E represent the total R-value of the existing plus added insulation.

Operating Hours

The energy savings for insulation are dependent on the HVAC system operating hours and thermostat set points. See Appendix A for the modeling assumptions for each building prototype.

WINDOW AND THROUGH-THE-WALL AIR CONDITIONER COVER AND GAP SEALER

Measure Description

A rigid, insulated cover, installed on the inside of a window or through-the-wall room air conditioning (RAC) unit, and the gap surrounding the unit. The cover is designed for RAC units left in place throughout the heating season; covers must be installed and maintained by building facility's staff.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings = N/A

Peak Coincident Demand Savings = N/A

Annual Gas Energy Savings

$$\Delta\text{therms} = \text{units} \times \left(\frac{1.08 \times \text{CFM} \times \text{HDD} \times 24 \text{ hrs/day}}{\text{HPs}} \right) / 100{,}000$$

where:

Δ kWh	= Annual electricity energy savings
Δ kW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
1.08	= Specific heat of air × density of inlet air @ 70°F × 60 min/hr
CFM	= Cubic foot per minute
HDD	= Heating degree day
HPs	= Heating plant seasonal efficiency
100,000	= Conversion factor (BTU/therm), one therm equals 100,000 BTU's

Summary of Variables and Data Sources

Variable	Value	Notes
Low-End Estimate at 5 Pa Indoor-Outdoor Pressure Differential	23	Annual Deemed Energy Savings Values (therms), for New York City
High-End Estimate at 10 Pa Indoor-Outdoor Pressure Differential	32	Annual Deemed Energy Savings Values (therms), for New York City
Indoor-Outdoor Pressure Differential	28	When indoor-outdoor pressure differential is not known, use the rounded average of 28 therms.
Heating plant seasonal efficiency, HPs	0.70	This value used in Urban Green Building Council study[1].
HDD	4,500	NYC Climate
CFM low end	13	Field tested leakage at 5 Pa indoor-outdoor

Variable	Value	Notes
		differential pressure
CFM high end	19	Field tested leakage at 10 Pa indoor-outdoor differential pressure

Note: Pa = Pascal, the standard unit of pressure or stress in the International system of units (SI)

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.

WINDOW REPLACEMENT

Measure Description

ENERGY STAR® windows with reduced thermal conductance and solar heat gain coefficient are an assembled unit consisting of a frame/sash component holding one or more pieces of glazing functioning to admit light and/or air into an enclosure and designed for a vertical installation in an external wall of a residential building.[85]

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times \frac{area_g}{100} \times \frac{\Delta kWh}{100\ ft^2} \times \frac{SEER_{baseline}}{SEER_{part}} \times \left[\frac{\bar{\eta}_{dist,baseline}}{\bar{\eta}_{dist,part}}\right]_{cooling}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times \frac{area_g}{100} \times \frac{\Delta kW}{100\ ft^2} \times \frac{EER_{baseline}}{EER_{part}} \times \left[\frac{\eta_{dist,pk,baseline}}{\eta_{dist,pk,part}}\right]_{cooling} \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times \frac{area_g}{100} \times \frac{\Delta therm}{100\ ft^2} \times \frac{AFUE_{baseline}}{AFUE_{part}} \times \left[\frac{\bar{\eta}_{dist,baseline}}{\bar{\eta}_{dist,part}}\right]_{heating}$$

where:

ΔkWh	= Annual electricity energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
$area_g$	= Glazing area (in ft^2)
EER	= Energy efficiency ratio under peak conditions
SEER	= Seasonal average energy efficiency ratio over the cooling season, BTU/watt-hour, (used for average U.S. location/region)
AFUE	= Annual fuel utilization efficiency
CF	= Coincidence factor
$_{part}$	= Participant
$_{dist}$	= Distribution
η	= Energy efficiency (0 -100%)
$\bar{\eta}$	= Average energy efficiency (0 -100%)

85 ENERGY STAR® Product Specification Residential Windows, Doors, and Skylights, Eligibility Criteria, V6.0, January 2014

Summary of Variables and Data Sources[86]

Variable	Value	Notes
$area_g$		Glazing area from application
$\Delta kWh/100ft^2$		HVAC type weighted average by city, use existing window type or vintage default for baseline.
$\Delta kW/100ft^2$		HVAC type weighted average by city, use existing window type or vintage default for baseline.
$\Delta therm/100ft^2$		HVAC type weighted average by city, use existing window type or vintage default for baseline.
$EER_{baseline}$	11.1	EER used in the simulations
EER_{part}		EER of cooling systems within participant population, average defaults to $EER_{baseline}$ (no adjustment)
$SEER_{baseline}$	13	SEER used in the simulations[87]
$SEER_{part}$		SEER of cooling system within participant population, average defaults to $SEER_{baseline}$ (no adjustment)
$AFUE_{baseline}$	80%	AFUE used in the simulations[88]
$AFUE_{part}$		AFUE of heating system within participant population, average defaults to $AFUE_{baseline}$ (no adjustment)
$\bar{\eta}_{dist,baseline}$	0.956	Distribution system seasonal efficiency used in simulations
$\bar{\eta}_{dist,part}$		Distribution system seasonal efficiency within participant population, average defaults to $\bar{\eta}_{dist,baseline}$ (no adjustment)
$\eta_{dist,pk,baseline}$	0.956	Distribution system efficiency under peak conditions used in simulation
$\eta_{dist,pk,part}$		Distribution system efficiency under peak conditions within participant population, average defaults to $\eta_{dist,pk,baseline}$ (no adjustment)

Unit energy and demand savings calculated from the building prototype simulation models are shown in Appendix F. The savings are tabulated by location, building type, and HVAC system type for a variety of combinations of existing window and improved window types.

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.69.[89]

Baseline Efficiencies from which Savings are Calculated[3]

A variety of existing window combinations are shown in the unit savings tables in Appendix F, including single pane clear glass, double pane clear and a minimally code compliant window. Energy savings are estimated based on the characteristics of the existing window. Single pane

[86] Due to schedule of revisions, values specified here may not align with those presented throughout appendices.
[87] 10 CFR 430.32 (c)(1)(i) – Assumes a 3-ton split AC.
[88] 10 CFR 430.32 (e)(2)(i)(A) – Assumes an 80 MBh gas furnace.
[89] Based on BG&E 'Development of Residential Load Profile for Central Air Conditioners and Heat Pumps' research, the Maryland Peak Definition coincidence factor is 0.69. This study is not publicly available, but is referenced by the Mid-Atlantic TRM Version 6.0 published May 2016. MD factor used as approximation for NY-specific value.

clear glass is the default for the old vintage, while double pane clear glass is the default for the average vintage. The minimally code compliant window is assumed to be the base case for new construction or window replacement projects.

Compliance Efficiency from which Incentives are Calculated

A typical window meeting the current ENERGY STAR® specifications is assumed to be the installed measure. The specifications assumed are listed below.[90]

U-Value (Btu/h ft^2-°F)	Solar Heat Gain Coefficient (SHGC)
≤0.27	Any
0.28	≥0.32
0.29	≥0.37
0.30	≥0.42

Operating Hours

The energy savings for windows are dependent on the HVAC system operating hours and thermostat set points. See Appendix A for the modeling assumptions for each building prototype.

DOMESTIC HOT WATER

<u>HEAT PUMP WATER HEATER (HPWH) – AIR SOURCE</u>

Measure Description

This measure covers the installation of electric storage tank water heaters that use heat pump technology to move heat from the air (inside or outside the building) to the water storage tank and are designed to heat and store potable water at a thermostatically controlled temperature of less than 180°F. It is not intended for equipment delivering process or space heating hot water. It applies to electric heat pump water heaters with a maximum current rating of 24 amperes at a voltage no greater than 250 volts and with a rated storage tank capacity of 120 gallons or less.[92,93]

This measure applies to new construction/major renovation projects and replacement of existing electric water heaters and assumes baseline to be a minimally code compliant electric storage type water heater.

This measure applies to residential applications as well as residential-duty water heaters installed in commercial settings. In the latter case, this methodology shall be employed utilizing typical GPD values as defined in the "Gallons per Day (GPD)" section of the Commercial Storage Tank Water Heater measure detailed in this document.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times \frac{GPD \times 365 \times 8.33 \times \Delta T_{main}}{3{,}412} \times \left[\frac{1}{UEF_{baseline}} - \frac{1}{UEF_{ee} \times F_{derate}}\right] + \Delta kWh_{cooling} - \left(\Delta kWh_{heating} \times F_{ElecHeat}\right)$$

$$\Delta kWh_{cooling} = units \times \frac{GPD \times 365 \times 8.33 \times \Delta T_{main}}{3{,}412} \times \left[1 - \frac{1}{UEF_{ee}}\right] \times F_{Loc} \times \frac{F_{Cool}}{SEER/3.412}$$

$$\Delta kWh_{heating} = units \times \frac{GPD \times 365 \times 8.33 \times \Delta T_{main}}{3{,}412} \times \left[1 - \frac{1}{UEF_{ee}}\right] \times F_{Loc} \times \frac{F_{Heat}}{HSPF/3.412}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times (\Delta kW/unit)$$

[92] ENERGY STAR® Program Requirements Product Specification for Residential Water Heaters, Eligibility Criteria Version 3.2, September 2017

[93] 10 CFR 430.2

Annual Gas Energy Savings

$$\Delta therms = units \times \frac{GPD \times 365 \times 8.33 \times \Delta T_{main}}{3{,}412} \times \left[1 - \frac{1}{UEF_{ee}}\right] \times F_{Loc} \times F_{GasHeat} \times \frac{F_{Heat}}{AFUE}$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
GPD	= Gallons per day
ΔT_{main}	= Average temperature difference between water heater set point temperature and the supply water temperature in water main (°F)
baseline	= Baseline condition or measure
ee	= Energy efficient condition or measure
UEF	= Uniform energy factor
F_{derate}	= Efficiency derating factor used to account for the degradation of heat pump performance present in systems installed in unconditioned spaces
$\Delta kWh_{cooling}$	= Annual electric cooling energy savings as a result of interactivity with the building's HVAC system (electric cooling bonus)
$\Delta kWh_{heating}$	= Annual electric heating energy savings as a result of interactivity with the building's HVAC system (electric heating penalty)
$F_{ElecHeat}$	= Electric heating factor, used to exclude electric heating penalty if no electric heating is present
F_{Loc}	= Installation location factor, used to exclude interactive HVAC impacts for systems installed in unconditioned spaces
F_{Cool}	= Cooling factor, used to account for the percentage of heat extracted from ambient air by the heat pump water heater that reduces space cooling load
SEER	= Seasonal average energy efficiency ratio over the cooling season, BTU/watthour, (used for average U.S. location/region)
F_{Heat}	= Heating factor, used to account for the percentage of heat extracted from ambient air by the heat pump water heater that increases space heating load
HSPF	= Heating seasonal performance factor, BTU/watt-hour, total heating output (supply heat) in BTU (including electric heat) during the heating season / total electric energy heat pump consumed (in watt-hour)
$F_{GasHeat}$	= Gas heating factor, used to exclude gas heating penalty if no gas heating is present
AFUE	= Annual fuel utilization efficiency, seasonal energy efficiency for fuel heating equipment
(ΔkW/unit)	= Deemed peak coincident demand savings per measure
365	= Days in one year
8.33	= Energy required (BTU) to heat one gallon of water by one degree Fahrenheit
3,412	= Conversion factor, one kWh equals 3,412 BTU

Summary of Variables and Data Sources

Variable	Value	Notes
GPD	17.2 X # of people	Calculated based on number of people served by the system. If unknown, use 46 GPD.[94]
ΔT_{main}	T_{set} - T_{main}	Average temperature difference between water heater set point temperature and the supply water temperature in water main (°F).
T_{set}	140	Water heater set point temperature (°F).[95]
T_{main}		Supply water temperature in water main (°F). Lookup in Cold Water Inlet Temperature table below based on nearest city.
$UEF_{baseline}$		Uniform Energy Factor of the baseline condition. See Baseline Efficiencies… section below for details regarding derivation of this input.
UEF_{ee}		Uniform Energy Factor of the energy efficient measure, from application.
F_{derate}		For equipment installed in unconditioned spaces, lookup in Derate Factor table below based on installation location and nearest city. For equipment installed in conditioned spaces, a value of 1.0 shall be used.
$F_{ElecHeat}$		Use a value of 1.0 if the building is electrically heated. Otherwise, use 0.0.
F_{Loc}		Use a value of 1.0 if the water heater is installed in a conditioned space. Otherwise, use 0.0.
F_{Cool}		Lookup in HVAC Interactivity table below based on nearest city.
SEER	13	Assumed efficiency of existing air conditioning system, based on a minimally code compliant, 3-ton, split system AC.[96]
F_{Heat}		Lookup in HVAC Interactivity table below based on nearest city.
HSPF	Heat Pump – 8.2 Electric Resistance – 3.412	Assumed efficiency of electric heating system, based on a COP of 1.0 for electric resistance heating and a minimally code compliant, 3-ton split system HP for heat pumps.[97]

[94] Water Research Foundation: Residential End Uses of Water, Version 2, April 2016, p. 5; 17.2 GPD equated from the report findings indicating an average 2.65 people per household and 45.5 GPD per household.

[96] ECCCNYS 2016, Table C403.2.3(1) & NYCECC 2016, Table C403.2.3(1)
[97] ECCCNYS 2016, Table C403.2.3(2) & NYCECC 2016, Table C403.2.3(2)

Variable	Value	Notes
$F_{GasHeat}$		Use a value of 1.0 if the building is gas heated. Otherwise, use 0.0.
AFUE	80%	Assumed efficiency of gas heating system, based on a minimally code compliant, 80 MBH gas furnace.[98]
(ΔkW/unit)	0.17	Deemed peak coincident demand savings[99]

Cold Water Inlet Temperature (T_{main})

Supply water main temperatures vary according to climate, and are approximately equal to the annual average outdoor temperature plus 6°F.[100] Supply main temperatures based on the annual outdoor temperature are shown below.

City	Annual average outdoor temperature[101] (°F)	T_{main} (°F)
Albany	48.3	54.3
Binghamton	46.3	52.3
Buffalo	48.3	54.3
Massena	43.5	49.5
NYC	55.4	61.4
Poughkeepsie	49.8	55.8
Syracuse	48.3	54.3

Derate Factor

Standard testing conditions for rating of heat pump water heaters require a dry bulb temperature of 67.5°F ± 1°F and a relative humidity of 50% ±2%.[102] The reported efficiency of heat pump water heaters is established at these conditions; however, heat pump efficiency degrades at lower ambient temperatures. The Derate Factor is established to adjust the published efficiency of the qualifying heat pump water heater when the system is installed in semi-conditioned or unconditioned spaces, namely, garages and basements. The values shown below were derived from Table 10 of Residential Heat Pump Water Heater Evaluation: Lab Testing & Energy Use Estimates published by Bonneville Power Administration in 2011[103] and verified via comparison with results from the 2013 NEEA Heat Pump Water Heater Field Study Report.[104] Average values from northwest heating zones 1 (<6,000 HDD), 2 (6,000 – 7,500 HDD) and 3 (>7,500 HDD)[105] from this analysis and comparison were then mapped to representative NY climate regions as shown

below.

City	F_{derate} (Unconditioned Basement Installation)	F_{derate} (Garage Installation)
Albany	0.80	0.78
Binghamton	0.80	0.78
Buffalo	0.80	0.78
Massena	0.75	0.69
NYC	0.86	0.83
Poughkeepsie	0.80	0.78
Syracuse	0.80	0.78

<u>HVAC Interactivity</u>
Because heat pump water heaters operate via the transfer of heat from the ambient air to the water in the storage tank, systems installed in conditioned spaces will interact with the building's HVAC system. The values shown in the table below reflect the percentage of heat extracted from the ambient air by the heat pump that either decreases the building's cooling load (F_{Cool}) or increases the building's heating load (F_{Heat}). These values were derived from Table 12 of Residential Heat Pump Water Heater Evaluation: Lab Testing & Energy Use Estimates published by Bonneville Power Administration in 2011[106] and key operating assumptions specified therein. Average values from northwest heating zones 1 (<6,000 HDD), 2 (6,000 – 7,500 HDD) and 3 (>7,500 HDD)[107] were then mapped to representative NY climate regions and scaled linearly based on regional HDD and CDD. The HDD and CDD values are based on 30-year averages of U.S annual climate normals between 1981 and 2010 using base 65° F.[108]

City	CDD	F_{Cool}	HDD	F_{Heat}
Albany	597	0.26	6680	0.70
Binghamton	382	0.17	7193	0.76
Buffalo	544	0.24	6617	0.70
Massena	363	0.16	8196	0.84
Poughkeepsie	671	0.29	6210	0.65
NYC	1160	0.51	4671	0.49
Syracuse	570	0.25	6651	0.70

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A. Deemed demand savings values incorporate system peak coincidence considerations.

[106] Residential Heat Pump Water Heater Evaluation: Lab Testing & Energy Use Estimates, Bonneville Power Administration, November 2011
[107] NW Council Heating/Cooling zone maps
[108] HDD/CDD taken from NCDC 1981-2010 climate normals

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a minimally code compliant electric storage water heater with storage tank capacity and draw pattern equivalent to the proposed case.

$UEF_{baseline}$ shall be calculated as a function of qualifying equipment tank volume (v_t) per federal standards[109] as shown in the table below, using the qualifying equipment capacity and draw pattern. Draw pattern can be established based on the proposed equipment First Hour Rating (FHR), rated in gallons. See First Hour Rating vs. Draw Pattern table below. If FHR is unknown, a Medium draw pattern should be assumed for equipment with rated storage capacity ≤50 gallons and a High draw pattern should be assumed otherwise.[110]

Product Class	Rated Storage Volume and Input Rating	Draw Pattern	$UEF_{baseline}$
Electric Storage Water Heater	≥ 20 gal and ≤ 55 gal	Very Small	0.8808 - (0.0008 x v_t)
		Low	0.9254 - (0.0003 x v_t)
		Medium	0.9307 - (0.0002 x v_t)
		High	0.9349 - (0.0001 x v_t)
	> 55 gal and ≤ 120 gal	Very Small	1.9236 - (0.0011 x v_t)
		Low	2.0440 - (0.0011 x v_t)
		Medium	2.1171 - (0.0011 x v_t)
		High	2.2418 - (0.0011 x v_t)

*v_t = tank volume in gallons

First Hour Rating vs. Draw Pattern[111]

First Hour Rating	Draw Pattern
<18 gallons	Very Small
≥18 and <51 gallons	Low
≥51 and <75 gallons	Medium
≥75 gallons	High

Compliance Efficiency from which Incentives are Calculated

The compliance condition is a heat pump water heater meeting minimum performance requirements dictated by program eligibility criteria.

Operating Hours

Water heater run hours are not utilized in the estimation of energy or demand savings, but water heater is assumed to be available for operation 8,760 hours per year.

Effective Useful Life (EUL)

See Appendix P.

[109] 10 CFR 430.32(d)
[110] Based on review of typical usage bins for AHRI certified residential water heating equipment (https://www.ahridirectory.org/ahridirectory/pages/home.aspx)
[111] 10 CFR 429.17

Ancillary Fossil Fuel Savings Impacts

Heat pump water heaters installed in conditioned spaces will result in an increase in space heating load due to the extraction of heat from the ambient air. This interactivity is addressed in the prescribed methodology.

Ancillary Electric Savings Impacts

Heat pump water heaters installed in conditioned spaces will result in an increase in space heating load and a decrease in cooling load due to the extraction of heat from the ambient air. This interactivity is addressed in the prescribed methodology.

INDIRECT WATER HEATER

Measure Description

This measure covers the installation of a gas indirect-fired storage water heating system in which the stored water is heated via hot water produced by a gas boiler rather than direct input from electric elements or gas burners. In such a system, a heat exchanger separates the potable water in the water heater from the boiler water. This measure applies to indirect-fired systems comprising a boiler with input heating capacity less than 300,000 Btu/h and a storage tank with a capacity of 20 to 120 gallons. Larger equipment installed in whole building or multi-unit multifamily settings shall use the Commercial and Industrial Indirect Water Heater measure detailed in this document.

This measure estimates savings associated with the delivery of potable hot water only and assumes the installation of zone priority controls to interrupt demand for space heating hot water until domestic hot water demand is met.

This measure assumes baseline to be a minimally code compliant gas storage type water heater with storage capacity equivalent to the proposed case.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = N/A$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = units \times \left[\frac{GPD \times 365 \times 8.33 \times \Delta T_{main}}{100{,}000} \times \left[\frac{1}{Eff_{baseline}} - \frac{1}{Eff_{ee}}\right] + \left[\frac{UA_{baseline}}{Eff_{baseline}} - \frac{UA_{ee}}{Eff_{ee}}\right] \times \frac{\Delta T_{amb}}{100{,}000} \times 8{,}760\right]$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
GPD	= Gallons per day
ΔT_{main}	= Average temperature difference between water heater set point temperature and the supply water temperature in water main (°F)
ΔT_{amb}	= Average temperature difference between water heater set point temperature and the surrounding ambient air temperature (°F)
$_{baseline}$	= Baseline condition or measure

ee	= Energy efficient condition or measure
Eff	= Efficiency
UA	= Overall heat loss coefficient (BTU/hr-°F)
365	= Days in one year
8.33	= Energy required (BTU) to heat one gallon of water by one degree Fahrenheit
100,000	= Conversion factor (BTU/therm), one therm equals 100,000 BTU
8,760	= Hours in one year

Summary of Variables and Data Sources

Variable	Value	Notes
GPD	17.2 X # of people	Calculated based on number of people served by the system. If unknown, use 46 GPD.[112]
ΔT_{main}	T_{set} - T_{main}	Average temperature difference between water heater set point temperature and the supply water temperature in water main (°F)
ΔT_{amb}	70 (T_{set} - T_{amb})	Average temperature difference between water heater set point temperature and the surrounding ambient air temperature (°F)
T_{set}	140	Water heater set point temperature (°F).[113]
T_{main}		Supply water temperature in water main (°F). Lookup in Cold Water Inlet Temperature table below based on nearest city.
T_{amb}	70	Surrounding ambient air temperature (°F).[114]
$Eff_{baseline}$	75%	Efficiency of the baseline condition.[115]
Eff_{ee}		Efficiency of energy efficient indirect-system boiler (AFUE), from application.
$UA_{baseline}$	7.85	Overall heat loss coefficient of the baseline condition (BTU/hr-°F).[116]

[112] Water Research Foundation: Residential End Uses of Water, Version 2, April 2016, p. 5; 17.2 GPD equated from the report findings indicating an average 2.65 people per household and 45.5 GPD per household.
[113] Per OSHA recommendations for prevention of Legionella bacterial growth (https://www.osha.gov/dts/osta/otm/legionnaires/hotwater.html)
[114] Water heaters are generally located in conditioned or partially conditioned spaces with a typical average temperature of 65°F to 70°F to avoid freezing. A value of 70°F is used for the purposes of estimating tank/ambient air temperature differential, which aligns with standby loss specification testing standards.
[115] Per 10 CFR 430, typical recovery efficiency of a gas water heater, which is used for the purposes of this measure as a proxy for thermal efficiency, is 0.75. See for example, 10 CFR 430 Subpart B Appendix C1, 5.6.1.1.
[116] Based on computation of heat loss coefficients via conversion equations found in 10 CFR 429, 430, and 431 Docket No. EERE-2015-BT-TP-0007, Energy Conservation Program for Consumer Products and Certain Commercial and Industrial Equipment: Test Procedures for Consumer and Commercial Water Heaters. Heat loss coefficient was equated for two minimally code compliant gas storage water heaters found to be the most typical in terms of storage and input capacity, representing storage type water heaters of between 20 and 55 gallon capacity (40 gallon, 40,000 Btu/h assumed) and between 55 and 120 gallon capacity (75 gallon, 76,000 Btu/h assumed). Results of heat loss coefficient evaluation at these two data points agreed to within 0.3%, so the lower of the two was selected to represent the $UA_{baseline}$ term.

Variable	Value	Notes
UA_{ee}		Overall heat loss coefficient of the energy efficient measure (BTU/hr-°F). Calculate per Qualifying Heat Loss Coefficient section below, based on qualifying equipment standby loss specification, rated in °F/hr. If unknown, assume UA_{ee} = 5.4.[117]

Cold Water Inlet Temperature (T_{main})

Supply water main temperatures vary according to climate, and are approximately equal to the annual average outdoor temperature plus 6°F.[118] Supply main temperatures based on the annual outdoor temperature are shown below.

City	Annual average outdoor temperature[119] (°F)	T_{main} (°F)
Albany	48.3	54.3
Binghamton	46.3	52.3
Buffalo	48.3	54.3
Massena	43.5	49.5
NYC	55.4	61.4
Poughkeepsie	49.8	55.8
Syracuse	48.3	54.3

Qualifying Heat Loss Coefficient (UA_{ee})

Indirect-fired water heater storage tanks are tested and rated for standby losses (in °F/hr) at standard testing conditions in accordance with testing standards.[120] The qualifying equipment standby loss specification (SL_{ee}), where available, shall be used in the formula below, along with tank volume (v_{ee}) to establish the qualifying equipment heat loss coefficient (UA_{ee}).

$$UA_{ee} = \frac{SL_{ee}}{70} \times v_{ee} \times 8.33$$

where:

UA_{ee} = Overall heat loss coefficient (BTU/hr-°F) of the energy efficient condition or measure

SL_{ee} = Standby loss specification (°F/hr) of the energy efficient condition or measure

v_{ee} = Rated storage capacity (gallons) of the energy efficient condition or measure

70 = Temperature differential (°F) utilized in standby loss testing procedure

8.33 = Energy required (BTU) to heat one gallon of water by one degree Fahrenheit

---

[117] Based on the average standby loss specification (in °F/hr) of AHRI-certified Indirect Water Heater storage tanks, per the AHRI Directory.

[118] Burch, Jay and Christensen, Craig, "Towards Development of an Algorithm for Mains Water Temperature." National Renewable Energy Laboratory

[119] Average annual outdoor temperatures taken from NCDC 1981-2010 climate normals

[120] GAMA Testing Standard: Performance of Indirect-Fired Water Heaters, March 2003

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A.

Baseline Efficiencies from which Incentives are Calculated

The baseline condition is a minimally code compliant gas storage type water heater with a recovery efficiency of 75%, tank volume equal to the energy efficient condition and heat loss coefficient as indicated above.

Compliance Efficiency from which Incentives are Calculated

The compliance condition is an indirect gas-fired water heating system meeting minimum performance requirements dictated by program eligibility criteria.

Operating Hours

Water heater run hours are not utilized in the estimation of energy or demand savings, but water heater is assumed to be available for operation 8,760 hours per year. Additionally, it is assumed standby losses are incurred 8,760 hours per year.

Effective Useful Life (EUL)

See Appendix P.

Ancillary Fossil Fuel Savings Impacts

Reduction in standby heat losses will have a negligible impact on space heating when the water heater is located in conditioned space. Consideration of these effects is not included in this methodology.

Ancillary Electric Savings Impacts

Reduction in standby heat losses will have a negligible impact on space heating and cooling when the water heater is located in conditioned space. Consideration of these effects is not included in this methodology.

STORAGE TANK AND INSTANTANEOUS DOMESTIC WATER HEATER

Measure Description

This measure covers the installation of storage tank water heaters designed to heat and store water at a thermostatically controlled temperature, as well as instantaneous type water heaters, which heat water but contain no more than one gallon of water per 4,000 BTU per hour of input. This measure applies to potable hot water delivery only; it is not applicable to hot water heaters used for process loads or space heating. Additionally, qualifying equipment must be designed to heat water to a temperature no greater than 180°F and, if electric power is required for operation, must use a single-phase external power supply.

Storage type units include residential gas storage water heaters with a nominal input of 75,000 BTU per hour or less and a rated storage capacity between 20 and 100 gallons, residential-duty commercial gas storage water heaters with a nominal input of greater than 75,000 BTU per hour and less than or equal to 105,000 BTU per hour and a rated storage capacity between 20 and 120 gallons and electric storage water heaters with an input of 12 kilowatts or less and a rated storage capacity between 20 and 120 gallons.

Instantaneous type units include gas instantaneous water heaters with a rated input capacity of greater than or equal to 50,000 and less than 200,000 BTU per hour and a manufacturer's specified storage capacity of less than 2 gallons, residential electric instantaneous water heaters with an input of 12 kilowatts or less and a manufacturer's specified storage capacity of less than 2 gallons and residential-duty commercial electric instantaneous water heaters with an input of greater than 12 kilowatts and less than or equal to 56.8 kilowatts and a manufacturer's specified storage capacity of 2 gallons or less.[121]

This measure applies to replacement of existing storage type and instantaneous water heaters using the same heating fuel (gas or electric) as the proposed case. For new construction, this measure assumes baseline to be a minimally code compliant water heater of the same type (storage or instantaneous) and using the same heating fuel (gas or electric) as the proposed case.

This measure applies to residential applications as well as residential-duty water heaters installed in commercial settings. In the latter case, this methodology shall be employed utilizing typical GPD values as defined in the "Gallons per Day (GPD)" section of the Commercial Storage Tank Water Heater measure detailed in this document.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings (Electric Equipment Only)

$$\Delta kWh = units \times \frac{GPD \times 365 \times 8.33 \times \Delta T_{main}}{3{,}412} \times \left[\frac{1}{UEF_{baseline}} - \frac{1}{UEF_{ee}}\right]$$

[121] Definitions of qualifying system types and specifications per 10 CFR 430.2 and revised in accordance with the limitations imposed by 10 CFR 430.32(d) and 10 CFR 431.110(b).

Peak Coincident Demand Savings (Electric Equipment Only)

$$\Delta kW = units \times \frac{(UA_{baseline} - UA_{ee}) \times \Delta T_{amb}}{3{,}412} \times CF$$

Annual Gas Energy Savings (Gas Equipment Only)

$$\Delta therms = units \times \frac{GPD \times 365 \times 8.33 \times \Delta T_{main}}{100{,}000} \times \left[\frac{1}{UEF_{baseline}} - \frac{1}{UEF_{ee}}\right]$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
GPD	= Gallons per day
ΔT_{main}	= Average temperature difference between water heater set point temperature and the supply water temperature in water main (°F)
ΔT_{amb}	= Average temperature difference between water heater set point temperature and the surrounding ambient air temperature (°F)
$_{baseline}$	= Baseline condition or measure
$_{ee}$	= Energy efficient condition or measure
UEF	= Uniform energy factor
UA	= Overall heat loss coefficient (BTU/hr-°F)
CF	= Coincidence factor
365	= Days in one year
8.33	= Energy required (BTU) to heat one gallon of water by one degree Fahrenheit
3,412	= Conversion factor, one kWh equals 3,412 BTU
100,000	= Conversion factor (BTU/therm), one therm equals 100,000 BTU

Summary of Variables and Data Sources

Variable	Value	Notes
GPD	17.2 X # of people	Calculated based on number of people served by the system. If unknown, use 46 GPD.[122]
ΔT_{main}	$T_{set} - T_{main}$	Average temperature difference between water heater set point temperature and the supply water temperature in water main (°F)
ΔT_{amb}	70 ($T_{set} - T_{amb}$)	Average temperature difference between water heater set point temperature and the surrounding ambient air temperature (°F)

[122] Water Research Foundation: Residential End Uses of Water, Version 2, April 2016, p. 5; 17.2 GPD equated from the report findings indicating an average 2.65 people per household and 45.5 GPD per household.

Variable	Value	Notes
T_{set}	140	Water heater set point temperature (°F).[123]
T_{main}		Supply water temperature in water main (°F). Lookup in Cold Water Inlet Temperature table below based on nearest city.
T_{amb}	70	Surrounding ambient air temperature (°F).[124]
$UEF_{baseline}$		Uniform Energy Factor of the baseline condition. See Baseline Efficiencies… section below for details regarding derivation of this input.
UEF_{ee}		Uniform Energy Factor of the energy efficient measure, from application
$UA_{baseline}$	7.85	Overall heat loss coefficient of the baseline condition (BTU/hr-°F).[125]
UA_{ee}		Overall heat loss coefficient of the energy efficient measure (BTU/hr-°F). For instantaneous water heaters, set $UA_{ee} = 0$. For storage type water heaters, set $UA_{ee} = 5.4$.[126]
CF	0.8	

Cold Water Inlet Temperature (T_{main})

Supply water main temperatures vary according to climate, and are approximately equal to the annual average outdoor temperature plus 6°F.[127] Supply main temperatures based on the annual outdoor temperature are shown below.

[123] Per OSHA recommendations for prevention of Legionella bacterial growth (https://www.osha.gov/dts/osta/otm/legionnaires/hotwater.html)

[124] Water heaters are generally located in conditioned or partially conditioned spaces with a typical average temperature of 65°F to 70°F to avoid freezing. A value of 70°F is used for the purposes of estimating tank/ambient air temperature differential, which aligns with standby loss specification testing standards.

[125] Based on computation of heat loss coefficients via conversion equations found in 10 CFR 429, 430, and 431 Docket No. EERE-2015-BT-TP-0007, Energy Conservation Program for Consumer Products and Certain Commercial and Industrial Equipment: Test Procedures for Consumer and Commercial Water Heaters. Heat loss coefficient was equated for two minimally code compliant gas storage water heaters found to be the most typical in terms of storage and input capacity, representing storage type water heaters of between 20 and 55 gallon capacity (40 gallon, 40,000 Btu/h assumed) and between 55 and 120 gallon capacity (75 gallon, 76,000 Btu/h assumed). Results of heat loss coefficient evaluation at these two data points agreed to within 0.3%, so the lower of the two was selected to represent the $UA_{baseline}$ term.

[126] Based on the average standby loss specification (in °F/hr) of AHRI-certified Indirect Water Heater storage tanks, per the AHRI Directory.

[127] Burch, Jay and Christensen, Craig, "Towards Development of an Algorithm for Mains Water Temperature." National Renewable Energy Laboratory

City	Annual average outdoor temperature[128] (°F)	T_{main} (°F)
Albany	48.3	54.3
Binghamton	46.3	52.3
Buffalo	48.3	54.3
Massena	43.5	49.5
NYC	55.4	61.4
Poughkeepsie	49.8	55.8
Syracuse	48.3	54.3

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.8[129].

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a minimally code compliant gas or electric storage or instantaneous type water heater (based on proposed conditions) with tank volume, input capacity and draw pattern equivalent to the proposed case.

$UEF_{baseline}$ shall be calculated as a function of qualifying equipment tank volume (v_t) for storage type water heaters or looked up for instantaneous water heaters per federal standards from the appropriate table (Residential Water Heaters or Residential-Duty Commercial Water Heaters) below, using the qualifying equipment type, capacity and draw pattern. Draw pattern can be established based on the proposed equipment First Hour Rating (FHR), rated in gallons, for storage type water heaters or Max Gallons per Minute (GPM), rated in gallons/minute, for instantaneous water heaters. See the First Hour Rating vs. Draw Pattern and Max GPM vs. Draw Pattern tables below for storage type and instantaneous water heaters, respectively. If FHR or Max GPM is unknown, a Medium draw pattern should be assumed for storage type water heaters with rated storage capacity ≤50 gallons and a High draw pattern should be assumed otherwise.[130]

[128] Average annual outdoor temperatures taken from NCDC 1981-2010 climate normals
[129] *No source specified – update pending availability and review of applicable references.*
[130] Based on review of typical usage bins for AHRI certified residential water heating equipment (https://www.ahridirectory.org/ahridirectory/pages/home.aspx)

Residential Water Heaters[131]

Product Class	Rated Storage Volume and Input Rating	Draw Pattern	$UEF_{baseline}$
Gas-Fired Storage Water Heater	≥ 20 gal and ≤ 55 gal	Very Small	0.3456 - (0.0020 x v_t*)
		Low	0.5982 - (0.0019 x v_t)
		Medium	0.6483 - (0.0017 x v_t)
		High	0.6920 - (0.0013 x v_t)
	> 55 gal and ≤ 100 gal	Very Small	0.6470 - (0.0006 x v_t)
		Low	0.7689 - (0.0005 x v_t)
		Medium	0.7897 - (0.0004 x v_t)
		High	0.8072 - (0.0003 x v_t)
Electric Storage Water Heater	≥ 20 gal and ≤ 55 gal	Very Small	0.8808 - (0.0008 x v_t)
		Low	0.9254 - (0.0003 x v_t)
		Medium	0.9307 - (0.0002 x v_t)
		High	0.9349 - (0.0001 x v_t)
	> 55 gal and ≤ 120 gal	Very Small	1.9236 - (0.0011 x v_t)
		Low	2.0440 - (0.0011 x v_t)
		Medium	2.1171 - (0.0011 x v_t)
		High	2.2418 - (0.0011 x v_t)
Instantaneous Gas-Fired Water Heater	< 2 gal and > 50,000 Btu/h	Very Small	0.80
		Low	0.81
		Medium	0.81
		High	0.81
Instantaneous Electric Water Heater	< 2 gal	Very Small	0.91
		Low	0.91
		Medium	0.91
		High	0.92

*v_t = tank volume in gallons

Residential-Duty Commercial Water Heaters[132]

Product Class	Rated Storage Volume and Input Rating	Draw Pattern	$UEF_{baseline}$
Gas-Fired Storage Water Heater	> 75,000 Btu/h and ≤ 105,000 Btu/h and ≤ 120 gal	Very Small	0.2674 - (0.0009 x v_t*)
		Low	0.5362 - (0.0012 x v_t)
		Medium	0.6002 - (0.0011 x v_t)
		High	0.6597 - (0.0009 x v_t)
Instantaneous Electric Water Heater	> 12 kW gal and ≤ 55 gal	Very Small	0.80
		Low	0.80
		Medium	0.80
		High	0.80

*v_t = tank volume in gallons

[131] 10 CFR 430.32(d)
[132] 10 CFR 431.110(b)

First Hour Rating vs. Draw Pattern (Storage Type Only)[133]

First Hour Rating	Draw Pattern
< 18 gallons	Very Small
≥ 18 and < 51 gallons	Low
≥ 51 and < 75 gallons	Medium
≥ 75 gallons	High

Max GPM vs. Draw Pattern (Instantaneous Only)[134]

Max GPM	Draw Pattern
< 1.7 gallons/minute	Very Small
≥ 1.7 and < 2.8 gallons/minute	Low
≥ 2.8 and < 4.0 gallons/minute	Medium
≥ 4.0 gallons/minute	High

Compliance Efficiency from which Incentives are Calculated

The compliance condition is a gas or electric storage or instantaneous type water heater as defined in the Measure Description section above meeting minimum performance requirements dictated by program eligibility criteria.

Operating Hours

Water heater run hours are not utilized in the estimation of energy or demand savings, but water heater is assumed to be available for operation 8,760 hours per year. Additionally, it is assumed standby losses are incurred 8,760 hours per year.

Effective Useful Life (EUL)

See Appendix P.

Ancillary Fossil Fuel Savings Impacts

Reduction in standby heat losses will have a negligible impact on space heating when the water heater is located in conditioned space. Consideration of these effects is not included in this methodology.

Ancillary Electric Savings Impacts

Reduction in standby heat losses will have a negligible impact on space heating and cooling when the water heater is located in conditioned space. Consideration of these effects is not included in this methodology.

DOMESTIC HOT WATER – CONTROL

FAUCET – LOW-FLOW AERATOR

Measure Description

A low-flow faucet aerator is a water saving device with rated gallons per minute (gpm) less than maximum allowable flowrate as mandated by federal, state and regional code. New York City plumbing code and New York State construction code dictate a maximum flowrate of 2.2 gpm for sink faucets and 1.5 gpm for lavatory faucets. This is a retrofit direct install measure or a new installation.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times H_2O_{savings} \times \left(T_{faucet} - T_{main}\right) \times \frac{8.33}{3{,}412} \times \frac{1}{UEF}$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = units \times H_2O_{savings} \times \left(T_{faucet} - T_{main}\right) \times \frac{8.33}{100{,}000} \times \frac{1}{UEF}$$

Note: to estimate the annual gallons of water saved from installation of measure

$$H_2O_{savings} = (GPM_{baseline} - GPM_{ee}) \times Flow_r \times \frac{minutes}{use} \times \frac{uses}{day} \times 365\,\frac{days}{yr}$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
$H_2O_{savings}$	= Water savings
T	= Temperature (°F)
UEF	= Uniform energy factor
GPM	= Gallon per minute
$Flow_r$	= Flow rate restricted
8.33	= Energy required (BTU's), to heat one gallon of water by one degree Fahrenheit
100,000	= Conversion factor, (BTU/therm), one therm equals 100,000 BTU's
3,412	= Conversion factor, one kW equals 3,412.14 BTU/h

Summary of Variables and Data Sources

Variable	Value	Notes
GPM_{ee}	1.5	GPM for energy efficient measure, from application (Non-lavatory faucets)
	1.0	GPM for energy efficient measure, from application (Lavatory faucets)
$GPM_{baseline}$	2.2	GPM for baseline measure (Non-lavatory faucets)[135,136]
	1.5	GPM for baseline measure (Lavatory faucets)[1,2]
$Flow_r$	0.75	Flow restriction factor of faucet aerator
minutes/use	0.5	Estimated duration of use (based on approximately 8.5 minutes of usage per faucet per day; assumes 26 minutes of faucet usage per household per day and 3 faucets per household)[137]
uses/day	17	Estimated number of uses per day (based on approximately 8.5 minutes of usage per faucet per day; assumes 26 minutes of faucet usage per household per day and 3 faucets per household)[138]
$H_2O_{savings}$	1,629	Calculated gallons of water saved per year based on installation of energy efficient measure (Non-lavatory faucets)
	1,163	Calculated gallons of water saved per year based on installation of energy efficient measure (Lavatory faucets)
T_{faucet}	80	The typical water temperature leaving the faucet in °F
T_{main}		Average inlet water temperature (see appending table) (°F)
UEF	See UEF Table Below	Uniform Energy Factor based on product class, size, input rating and draw pattern (if unknown, assume high draw pattern)[139]

Inlet water temperature from main, by location is shown below.

City	Annual average outdoor temperature (°F)	T main (°F)
Albany	48.2	54.2
Binghamton	46.9	52.9
Buffalo	48.3	54.3
Massena	44.7	50.7
Syracuse	48.6	54.6
Upstate Average	47.3	53.3
Long Island	56.5	62.5
NYC	56.5	55.0

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A.

Baseline Efficiencies from which Savings are Calculated

The Summary of Variables and Data Sources provides the baseline (standard) and low flow aerator water flows, related input assumptions, and the resulting water savings. Assumptions regarding average duration of use and number of uses per day are also presented. Uniform Energy Factor is determined for the assumed water heater system configurations cited per the table below (from Code of Federal Regulations 10 CFR 430.32(d)).

Product Class	Rated Storage Volume and Input Rating	Draw Pattern	Uniform Energy Factor
Gas-Fired Storage Water Heater	≥ 20 gal and ≤ 55 gal	Very Small	$0.3456 - (0.0020 \times V_t^*)$
		Low	$0.5982 - (0.0019 \times V_t)$
		Medium	$0.6483 - (0.0017 \times V_t)$
		High	$0.6920 - (0.0013 \times V_t)$
	> 55 gal and ≤ 100 gal	Very Small	$0.6470 - (0.0006 \times V_t)$
		Low	$0.7689 - (0.0005 \times V_t)$
		Medium	$0.7897 - (0.0004 \times V_t)$
		High	$0.8072 - (0.0003 \times V_t)$
Electric Storage Water Heater	≥ 20 gal and ≤ 55 gal	Very Small	$0.8808 - (0.0008 \times V_t)$
		Low	$0.9254 - (0.0003 \times V_t)$
		Medium	$0.9307 - (0.0002 \times V_t)$
		High	$0.9349 - (0.0001 \times V_t)$
	> 55 gal and ≤ 100 gal	Very Small	$1.9236 - (0.0011 \times V_t)$
		Low	$2.0440 - (0.0011 \times V_t)$
		Medium	$2.1171 - (0.0011 \times V_t)$
		High	$2.2418 - (0.0011 \times V_t)$
Instantaneous Gas-Fired Water Heater	< 2 gal and > 50,000 Btu/h	Very Small	0.80
		Low	0.81
		Medium	0.81
		High	0.81
Instantaneous Electric Water Heater	< 2 gal	Very Small	0.91
		Low	0.91
		Medium	0.91
		High	0.92

$^*V_t$ = Rated Storage Volume (gal)

Compliance Efficiency from which Incentives are Calculated

Compliance flow rates are specified in the Summary of Variables and Data Sources above.

Operating Hours

Operating hours are assumed at 365 days per year.

THERMOSTATIC SHOWER RESTRICTION VALVE

Measure Description

A thermostatic valve attached to a showerhead supply for reduction of domestic hot water flow and associated energy usage. The device restricts hot water flow through the showerhead by activating the trickle or stop flow mode when water reaches a temperature set point of 95°F, or slightly lower, depending on manufacturer.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times kWh\ savings$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = units \times therm\ savings$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
CF = Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
kWh savings	As defined in kWh Savings table below	Deemed annual electric energy savings for electric resistance storage tank water heater. Look up based on location and water usage rate (table below).
therm savings	As defined in Therm Savings table below	Deemed annual gas energy savings for natural gas storage tank water heater. Look up based on location and water usage rate (table below).
GPM_{ee}		Gallons per minute for energy efficient measure, from application
$Throttle_{fac}$	0.9	Used in LBNL study to adjust for occupant reduction in flow rate[141]

[141] LBNL: Potential Water and Energy Savings from Showerheads, March 2006

Variable	Value	Notes
Waste Time	1.58	Average value calculated from total water waste duration of five shower events (1 min., 35 secs.)[142]
Showers/day	2	Calculated from LBNL study based on assumption of 2.59 persons/household and 0.75 showers per day per capita[143]
T_{main}		Average inlet water temperature (°F) by location is shown below.
T_{shower}	105°F	Average temperature at showerhead; conservative assumption based on NYS plumbing code, EPA MFHR program and ASSE 1070-2014
UEF_{elec}	0.93	Uniform Energy Factor based on product class, size, input rating and draw pattern. Assumes electric storage water heater with 40-gal capacity at high draw.[144]
UEF_{gas}	0.64	Uniform Energy Factor based on product class, size, input rating and draw pattern. Assumes natural gas storage water heater with 40-gal capacity at high draw.[145]

kWh Savings

Location	Flow Rate (GPM)				
	1	**1.25**	**1.5**	**1.75**	**2**
Albany	138	173	207	242	277
Binghamton	142	177	213	248	284
Buffalo	138	173	207	242	276
Massena	148	185	222	259	296
Syracuse	137	172	206	240	274
Upstate Average	141	176	211	246	281
Long Island	116	145	174	202	231
NYC	136	170	204	238	272

The values in the kWh Savings table were calculated as follows, using the assumed values listed in the Summary of Variables and Data Sources table above:

$$kWh\ Savings = GPM_{ee} \times Throttle_{fac} \times Waste\ Time \times \frac{Showers}{day} \times 365\,\frac{days}{year} \times (T_{shower} - T_{main}) \times \frac{8.33}{3{,}412} \times \frac{1}{UEF_{elec}}$$

[142] LBNL: Water and Energy Wasted During Residential Shower Events, September 2011
[143] LBNL: Potential Water and Energy Savings from Showerheads, March 2006
[144] 10 CFR 430.32(d)
[145] Ibid.

Therm Savings

Location	Flow Rate (GPM)				
	1	1.25	1.5	1.75	2
Albany	6.9	8.6	10.3	12.0	13.7
Binghamton	7.0	8.8	10.6	12.3	14.1
Buffalo	6.9	8.6	10.3	12.0	13.7
Massena	7.3	9.2	11.0	12.8	14.7
Syracuse	6.8	8.5	10.2	11.9	13.6
Upstate Average	7.0	8.7	10.5	12.2	14.0
Long Island	5.7	7.2	8.6	10.0	11.5
NYC	6.8	8.4	10.1	11.8	13.5

The values in the Therm Savings table were calculated as follows, using the assumed values listed in the Summary of Variables and Data Sources table above:

$$Therm\ Savings\ =\ GPM_{ee}\ \times\ Throttle_{fac}\ \times Waste\ Time\ \times \frac{Showers}{day} \times 365\, \frac{days}{year}\ \times (T_{shower} -\ T_{main})\ \times \frac{8.33}{100{,}000}\ \times \frac{1}{UEF_{gas}}$$

Inlet water temperature from main, by location is shown below.

City	Annual average outdoor temperature (°F)	T_{main} (°F)
Albany	48.2	54.2
Binghamton	46.9	52.9
Buffalo	48.3	54.3
Massena	44.7	50.7
Syracuse	48.6	54.6
Upstate Average	47.3	53.3
Long Island	56.5	62.5
NYC	56.5	55.0

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A.

Baseline Efficiencies from which Savings are Calculated

If known and in compliance with applicable code, the actual flowrate of the showerhead should be used for determination of per unit energy savings from the tables above. Otherwise, a baseline of 2.0 gallons per minute shall be used for compliance in New York State (per 2017 NYS Uniform Code Supplement) and New York City, (per 2014 update to NYC Plumbing Code). Uniform Energy Factor is determined for the assumed water heater system configurations cited per the table below (from Code of Federal Regulations 10 CFR 430.32(d)).

Product Class	Rated Storage Volume and Input Rating	Draw Pattern	Uniform Energy Factor
Gas-Fired Storage Water Heater	≥ 20 gal and ≤ 55 gal	Very Small	0.3456 - (0.0020 x V_t^*)
		Low	0.5982 - (0.0019 x V_t)
		Medium	0.6483 - (0.0017 x V_t)
		High	0.6920 - (0.0013 x V_t)
	> 55 gal and ≤ 100 gal	Very Small	0.6470 - (0.0006 x V_t)
		Low	0.7689 - (0.0005 x V_t)
		Medium	0.7897 - (0.0004 x V_t)
		High	0.8072 - (0.0003 x V_t)
Electric Storage Water Heater	≥ 20 gal and ≤ 55 gal	Very Small	0.8808 - (0.0008 x V_t)
		Low	0.9254 - (0.0003 x V_t)
		Medium	0.9307 - (0.0002 x V_t)
		High	0.9349 - (0.0001 x V_t)
	> 55 gal and ≤ 100 gal	Very Small	1.9236 - (0.0011 x V_t)
		Low	2.0440 - (0.0011 x V_t)
		Medium	2.1171 - (0.0011 x V_t)
		High	2.2418 - (0.0011 x V_t)
Instantaneous Gas-Fired Water Heater	< 2 gal and > 50,000 Btu/h	Very Small	0.80
		Low	0.81
		Medium	0.81
		High	0.81
Instantaneous Electric Water Heater	< 2 gal	Very Small	0.91
		Low	0.91
		Medium	0.91
		High	0.92

*V_t = Rated Storage Volume (gal)

Compliance Efficiency from which Incentives are Calculated

Compliance conditions require installation of a program qualified thermostatic shower restriction valve.

Operating Hours

Number of showers per day and duration of water waste are as listed above in Summary of Variables and Data Sources.

SHOWERHEAD – LOW FLOW

Measure Description

A low flow showerhead is a water saving showerhead with rated gallons per minute (gpm) less than maximum allowable flowrate as mandated by federal, state and regional code. New York City plumbing code and New York State construction code dictate a maximum flowrate of 2.0 gpm for showerheads. This is a retrofit direct install measure or a new installation.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times H_2O_{savings} \times (T_{shower} - T_{main}) \times \frac{8.33}{3{,}412} \times \frac{1}{UEF}$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = units \times H_2O_{savings} \times (T_{shower} - T_{main}) \times \frac{8.33}{100{,}000} \times \frac{1}{UEF}$$

Note: to estimate the annual gallons of water saved from installation of measure

$$H_2O_{savings} = (GPM_{baseline} - GPM_{ee}) \times Throttle_{fac} \times \frac{minutes}{use} \times \frac{uses}{day} \times 365\frac{days}{yr}$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
$H_2O_{savings}$	= Water savings
T	= Temperature (°F)
UEF	= Uniform energy factor
GPM	= Gallon per minute
$Throttle_{fac}$	= Throttle factor
8.33	= Energy required (BTU’s), to heat one gallon of water by one degree Fahrenheit
100,000	= Conversion factor, (BTU/therm), one therm equals 100,000 BTU’s
3,412	= Conversion factor, one kW equals 3,412.14 BTU/h

Summary of Variables and Data Sources

Variable	Value	Notes
GPM_{ee}		Gallons per minute for energy efficient measure, from application
$GPM_{baseline}$	2.0	Gallons per minute for baseline[147,148]
$Throttle_{fac}$	0.9	Used in LBNL study to adjust for occupant reduction in flow rate[149]
minutes/use	8.2	Average shower duration per LBNL study.[150]
uses/day	2	Calculated from LBNL study based on assumption of 2.59 persons/household and 0.75 showers per day per capita.[151]
T_{main}		Average inlet water temperature (°F) by location is shown below.
T_{shower}	105^0F	Average temperature at showerhead; conservative assumption based on 2014 NYS plumbing code, EPA MFHR program and ASSE 1070-2014
UEF	See UEF Table Below	Uniform Energy Factor based on product class, size, input rating and draw pattern (if unknown, assume high draw pattern)[152]

Inlet water temperature from main, by location is shown below.

City	Annual average outdoor temperature (^{0}F)	T mains (°F)
Albany	48.2	54.2
Binghamton	46.9	52.9
Buffalo	48.3	54.3
Massena	44.7	50.7
Syracuse	48.6	54.6
Upstate Average	47.3	53.3
Long Island	56.5	62.5
NYC	56.5	55.0

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A.

Baseline Efficiencies from which Savings are Calculated

The Summary of Variables and Data Sources provides the baseline (standard) water flow and related input assumptions. Assumptions regarding average duration of use and number of uses per day are also presented. Uniform Energy Factor is determined for the assumed water heater system configurations cited per the table below (from Code of Federal Regulations 10 CFR 430.32(d)).

Product Class	Rated Storage Volume and Input Rating	Draw Pattern	Uniform Energy Factor
Gas-Fired Storage Water Heater	≥ 20 gal and ≤ 55 gal	Very Small	0.3456 - (0.0020 x V_t^*)
		Low	0.5982 - (0.0019 x V_t)
		Medium	0.6483 - (0.0017 x V_t)
		High	0.6920 - (0.0013 x V_t)
	> 55 gal and ≤ 100 gal	Very Small	0.6470 - (0.0006 x V_t)
		Low	0.7689 - (0.0005 x V_t)
		Medium	0.7897 - (0.0004 x V_t)
		High	0.8072 - (0.0003 x V_t)
Electric Storage Water Heater	≥ 20 gal and ≤ 55 gal	Very Small	0.8808 - (0.0008 x V_t)
		Low	0.9254 - (0.0003 x V_t)
		Medium	0.9307 - (0.0002 x V_t)
		High	0.9349 - (0.0001 x V_t)
	> 55 gal and ≤ 100 gal	Very Small	1.9236 - (0.0011 x V_t)
		Low	2.0440 - (0.0011 x V_t)
		Medium	2.1171 - (0.0011 x V_t)
		High	2.2418 - (0.0011 x V_t)
Instantaneous Gas-Fired Water Heater	< 2 gal and > 50,000 Btu/h	Very Small	0.80
		Low	0.81
		Medium	0.81
		High	0.81
Instantaneous Electric Water Heater	< 2 gal	Very Small	0.91
		Low	0.91
		Medium	0.91
		High	0.92

Compliance Efficiency from which Incentives are Calculated

Compliance flow rate is less than the specified baseline value (<2.0 gpm) or less than the more restrictive codes or guidelines of local governments, municipalities or entities which, for example, participate in the US EPA Water Sense® Partnership Program.

Operating Hours

Assumed duration of shower and assumed number of showers per day as listed above in Summary of Variables and Data Sources.

HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

AIR CONDITIONER - CENTRAL (CAC)

Measure Description

This measure covers the installation of high-efficiency central air conditioners in residential applications. A central air conditioner is a product, other than a packaged terminal air conditioner, which is powered by single phase electric current, air cooled, rated below 65,000 Btu per hour, not contained within the same cabinet as a furnace with rated capacity above 225,000 Btu per hour, and is a cooling unit only. A central air conditioner may consist of a single-package unit or an outdoor unit and one or more indoor units, including multi-head mini-split systems.[154] The baseline case shall be minimally code compliant equipment of the same type and capacity as in the proposed case, which shall be sized in accordance with federal, state and local energy conservation code.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times tons/unit \times \left(\frac{12}{SEER_{baseline}} - \frac{12}{SEER_{ee}}\right) \times EFLH_{cooling}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times tons/unit \times \left(\frac{12}{EER_{baseline}} - \frac{12}{EER_{ee}}\right) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
tons/unit	= Tons of air conditioning per unit, based on AHRI certification or nameplate data of condenser or matched pair (condenser and coil)
ee	= Energy efficient condition or measure
baseline	= Baseline condition or measure
SEER	= Seasonal average energy efficiency ratio over the cooling season, BTU/watt-hour, (used for average U.S. location/region)
EFLH	= Equivalent full-load hours
EER	= Energy efficiency ratio under peak conditions
CF	= Coincidence factor
12	= kBTUh/ton of air conditioning capacity

[154] 10 CFR 430.2

Summary of Variables and Data Sources

Variable	Value	Notes
tons		From application, default to average system size from applications if unknown
$SEER_{baseline}$		Lookup from Baseline Efficiencies table below based on product class and size.
$SEER_{ee}$		From application
$EFLH_{cooling}$		Lookup based on building type, vintage and location from Appendix G.
$EER_{baseline}$		Lookup from Baseline Efficiencies table below based on product class and size.
EER_{ee}		From application
CF	0.69	

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.69.[155]

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a central air conditioner as defined in the Measure Description section above, with rated SEER and EER per the table below. The SEER values listed in the table below reflect the minimum performance required by federal standards. Minimum EER requirements are not specified by federal standards for the state of New York, nor are they mandated by state or city code for residential equipment. For this equipment, baseline EER is established as follows[156]:

$$EER = (1.12 \times SEER) - (0.02 \times SEER^2)$$

Resultant values from application of this equation are tabulated in the baseline efficiencies table below.

Product Class	Seasonal Energy Efficiency Ratio (SEER)[157]	Energy Efficiency Ratio (EER)
Split System – Air Conditioner (<45 kBTUh)	13.0	11.2
Split System – Air Conditioner (≥45 and <65 kBTUh)	13.0	11.2
Single Package – Air Conditioner	14.0	11.8

[155] Based on BG&E 'Development of Residential Load Profile for Central Air Conditioners and Heat Pumps' research, the Maryland Peak Definition coincidence factor is 0.69. This study is not publicly available, but is referenced by the Mid-Atlantic TRM Version 7.0 published May 2017 and by M. M. Straub, Using Available Information for Efficient Evaluation of Demand-Side Management Programs, Electricity Journal, September 2011 and supported by research conducted by Cadmus on behalf of the TRM Management Committee.
[156] DOE, Building America House Simulation Protocols, October 2010
[157] 10 CFR 430.32 (c)(1)

Compliance Efficiency from which Incentives are Calculated

The compliance condition is a central air conditioner as defined in the Measure Description section above meeting minimum performance requirements dictated by program guidelines.

Operating Hours

Cooling EFLH data by location, building type and vintage are tabulated in Appendix G.

Effective Useful Life (EUL)

See Appendix P.

Ancillary Fossil Fuel Savings Impacts

Minor heating interactions are expected with efficient furnace fans utilized in most high efficiency air conditioners. These impacts are expected to be negligible and have not been addressed in the prescribed methodology at this time.

Ancillary Electric Savings Impacts

N/A

AIR CONDITIONER - ROOM (RAC)

Measure Description

This measure covers the installation of high-efficiency room air conditioners in residential applications. A room air conditioner is a consumer product, other than a packaged terminal air conditioner, which is powered by a single phase electric current and is an encased assembly designed as a unit for mounting in a window or through the wall for the purpose of providing delivery of conditioned air to an enclosed space. It includes a prime source of refrigeration and may include a means for ventilation and heating.[158] The baseline case shall be minimally code compliant equipment of the same type and capacity as in the proposed case, which shall be sized in accordance with federal, state and local energy conservation code. This measure is not applicable to central air conditioner systems.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times \frac{BTUh/unit}{1{,}000} \times \left(\frac{1}{CEER_{baseline}} - \frac{1}{CEER_{ee}}\right) \times EFLH_{cooling}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times \frac{BTUh/unit}{1{,}000} \times \left(\frac{1}{CEER_{baseline}} - \frac{1}{CEER_{ee}}\right) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
BTUh/unit	= British Thermal Units per hour of air conditioning per unit
$_{baseline}$	= Baseline condition or measure
$_{ee}$	= Energy efficient condition or measure
CEER	= Combined Energy Efficiency Ratio
EFLH	= Equivalent full-load hours
CF	= Coincidence factor
1,000	= Conversion factor, one kW equals 1,000 Watts

[158] 10 CFR 430.2

Summary of Variables and Data Sources

Variable	Value	Notes
BTUh/unit		From application
$CEER_{baseline}$		Lookup from Baseline Efficiencies section below based on equipment type and capacity.
$CEER_{ee}$		From application
$EFLH_{cooling}$		Cooling equivalent full-load hours, lookup from Operating Hours section below based on location.
CF	0.3	

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.3.[159] The average Seasonal CF based on 2007 weather data used for this measure aligns with results of a sampling study conducted in Con Edison territory, citing a CF = 0.31.[160]

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a room air conditioner as defined in the Measure Description section above with type and capacity equivalent to the proposed case and rated CEER per the table below. The CEER values listed in the table below reflect the minimum performance required by federal standards.[161]

Product Type	Product Class Capacity (BTU/h)	Federal Standard With Louvered Sides (CEER)	Federal Standard Without Louvered Sides (CEER)
RAC without Reverse Cycle	< 6,000	11.0	10.0
	6,000 to 7,999	11.0	10.0
	8,000 to 10,999	10.9	9.6
	11,000 to 13,999	10.9	9.5
	14,000 to 19,999	10.7	9.3
	20,000 to 27,999	9.4	9.4
	≥ 28,000	9.0	9.4
Casement Only	All	9.5	
Casement-Slider	All	10.4	

Compliance Efficiency from which Incentives are Calculated

The compliance condition is a room air conditioner as defined in the Measure Description section above meeting minimum performance requirements dictated by program guidelines.

AIR CONDITIONER AND HEAT PUMP - REFRIGERANT CHARGE CORRECTION

Measure Description

Correcting refrigerant charge on air conditioners and heat pumps in single-family and multi-family residential applications.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times tons/unit \times \left(\frac{12}{SEER_{uncorr}} - \frac{12}{SEER_{corr}} \right) \times EFLH_{cooling}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times tons/unit \times \left(\frac{12}{EER_{pk,\,uncorr}} - \frac{12}{EER_{corr}} \right) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
tons/unit = Tons of air conditioning per unit, based on nameplate data
EFLH = Equivalent full-load hours
EER = Energy efficiency ratio under peak conditions
SEER = Seasonal average energy efficiency ratio over the cooling season, BTU/watt-hour, (used for average U.S. location/region)
CF = Coincidence factor
$_{uncorr}$ = Uncorrected
$_{corrected}$ = Corrected
$_{pk}$ = Peak
12 = kBTUh/ton of air conditioning capacity

Summary of Variables and Data Sources

Variable	Value	Notes
tons	From application	From application or use 3 as default.
$SEER_{corr}$	From application	Unit nameplate SEER or default to 10 if unknown
EER_{corr}	From application	Unit EER or 9.2 as default
$SEER_{uncorr}$	From application	Use 0.9 adjustment factor or figure above if charge adjustment data available

Variable	Value	Notes
$EER_{pk,\ uncorr}$	From application	Use 0.9 adjustment factor or figure above if charge adjustment data available
$EFLH_{cooling}$		Vintage weighted average by city.

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.8

Baseline Efficiencies from which Savings are Calculated

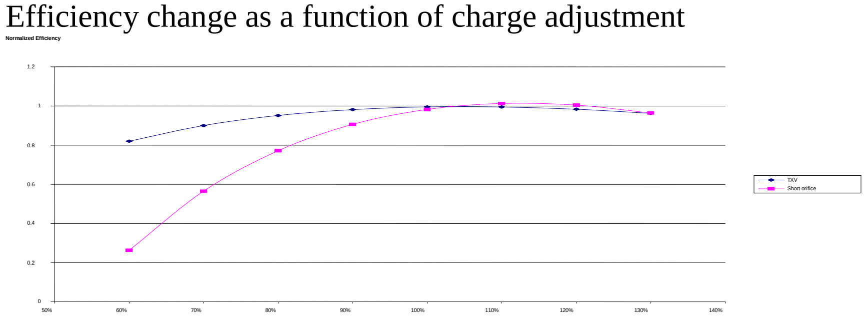
The SEER is an estimate of the average efficiency of the air conditioner over the cooling season, based on an average U.S. city. Programs should use the manufacturers' rated SEER until data can be developed that is more appropriate for NY climates. The EER is the ARI rated full-load efficiency of the unit, which is used to estimate the unit efficiency under peak conditions.

The efficiency improvement resulting from refrigerant charge adjustment depends on how far off the unit was before the adjustment was done, and whether the adjustment was done correctly. The DEER study lists two levels of charge adjustment, with a corresponding efficiency improvement: efficiency gains of 7% for refrigerant charge adjustments less than 20%, and efficiency gains of 16% for refrigerant charge adjustments greater than 20%. The magnitude of the charge adjustments expected are not known at this time, so a default value of 10% improvement in unit efficiency is recommended, the efficiency of an uncorrected unit is 10% below that of a corrected unit.

Parameter	Recommended Values
$EER_{pk,\ uncorr}$	$0.9 \times EER_{pk,\ corr}$
$SEER_{uncorr}$	$0.9 \times SEER_{corr}$

If the actual charge adjustment is recorded by the program, the efficiency adjustment factor as a function of charge adjustment is taken from the Figure below[163]. Note the efficiency change depends on the type of expansion valve. Use the curve labeled TXV for units with thermal expansion valves; otherwise use the curve labeled short orifice.

Efficiency change as a function of charge adjustment



[163] Efficiency as a function of charge adjustment from Small HVAC System Design Guide, New Buildings Institute, 2003.

Use uncorrected efficiency adjustment factor listed above if charge adjustment is not known, or base on actual charge adjustment and figure above.

Compliance Efficiency from which Incentives are Calculated

Operating Hours

EFLH data by location, building type and vintage are tabulated in Appendix G.

Effective Useful Life (EUL)

Years: 10

AIR CONDITIONER AND HEAT PUMP - RIGHT-SIZING

Measure Description

This section covers right sizing of residential central air conditioners and heat pumps. Right-sizing is a set of activities used to estimate building peak cooling load and correct system over-sizing when replacing air conditioners or heat pumps in single-family and multi-family residential applications. Equation below estimates savings from correcting over-sizing only; efficiency improvements from unit replacement are covered under the central air conditioner section.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times tons/unit \times \left(\frac{12}{SEER}\right) \times EFLH_{cooling} \times PSF_{consumption}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times tons/unit \times \left(\frac{12}{EER}\right) \times PSF_{consumption} \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
tons/unit	= Tons of air conditioning per unit, based on nameplate data
EFLH	= Equivalent full-load hours
EER	= Energy efficiency ratio under peak conditions
SEER	= Seasonal average energy efficiency ratio over the cooling season, BTU/watt-hour, (used for average U.S. location/region)
CF	= Coincidence factor
PSF	= Proper sizing factor
cooling	= Cooling
consumption	= Consumption
12	= kBTUh/ton of air conditioning capacity

Summary of Variables and Data Sources

Variable	Value	Notes
tons		From application
EER	11.09	Normal replacement
SEER	13	Normal replacement
$EFLH_{cooling}$		Lookup by vintage and city.
PSF_d	0.10	Proctor, 2009
PSF_c	0.03	Proctor, 2009

Proper Sizing factor (PSF)
PSF is used to estimate the energy and demand savings from right-sizing. This factor accounts for energy savings from improved part-load performance due to reductions in unit on/off cycling; and demand savings from a lower unit connected load.

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.8

Baseline Efficiencies from which Savings are Calculated

The SEER is an estimate of the average efficiency of the air conditioner over the cooling season, based on an average U.S. city. Programs should use the manufacturers' rated SEER until data can be developed that is more appropriate for NY climates.

The EER is the Air-Conditioning & Refrigeration Institute (ARI), rated full-load efficiency of the unit, which is used to estimate the unit efficiency under peak conditions.

Compliance Efficiency from which Incentives are Calculated

Operating Hours

Cooling EFLH data by location, building type and vintage are tabulated in Appendix G.

Effective Useful Life (EUL)

Blower Fan – with Electronically Commutated (EC) Motor for Furnace Distribution

Measure Description

This measure covers the retrofit of direct-drive Permanent Split Capacitor (PSC) motors with the installation of Electronically Commutated (EC) motors on gas furnace distribution system supply fans in residential applications. Energy savings are realized through reductions in fan power due to improved motor efficiency.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times (\Delta kWh/unit)$$

Peak Coincident Demand Savings

$$\Delta kW = units \times (\Delta kW/unit) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of motors installed under the program
(ΔkWh/unit) = Annual electric savings per motor installed
(ΔkW/unit) = Electric demand savings per motor installed
CF = Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
(ΔkWh/unit)		Lookup based on location and HVAC system type in table below.[164]
(ΔkW/unit)	0.117	Derived from Focus on Energy evaluation.[165]
CF	0.680	

[164] Cadmus Group, Focus on Energy Evaluated Deemed Savings Changes, November 2014
[165] Ibid.

The deemed annual electric energy savings are determined for each New York location by scaling the energy savings derived from the evaluation of a 2014 Wisconsin ECM metering study using heating degree days and cooling degree days for each location.[166] The Wisconsin study metered furnaces in 67 homes in Wisconsin in 2012 and 2013.

The total energy savings for each New York location are provided in the "Total" columns below. The energy savings are determined by summing the savings attributed to each furnace mode: circulation, heating and cooling. Homes with a central A/C receive the savings in the "Total (with Central A/C)" column. Homes without a central A/C receive the savings in the "Total (without Central A/C)": these savings exclude the "Cooling Mode" savings. The HDD and CDD values are based on 30-year averages of U.S annual climate normals between 1981 and 2010 using base 65° F.[167]

City	Annual Energy Saved (ΔkWh/unit)					HDD	CDD
	Total (with Central A/C)	Total (without Central A/C)	Circulation Mode	Heating Mode	Cooling Mode		
Albany	404	333	211	122	71	6,680	597
Binghamton	388	342	211	131	46	7,193	382
Buffalo	397	332	211	121	65	6,617	544
Massena	404	361	211	150	43	8,196	363
Poughkeepsie	404	324	211	113	80	6,210	671
NYC	435	296	211	85	139	4,671	1,160
Syracuse	401	333	211	122	68	6,651	570

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.680.[168]

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a residential furnace (with or without central AC) with a direct-drive PSC distribution system blower motor.

Compliance Efficiency from which Incentives are Calculated

The compliance condition is a residential furnace (with or without central AC) with an EC distribution system blower motor.

[166] The percent difference in HDD is applied to the Heating Mode column kWh savings and the percent difference in the CDD is applied to the Cooling Mode column kWh savings.
[167] Annual/Seasonal Normals taken from http://www.ncdc.noaa.gov/cdo-web/datatools/normals
[168] Cadmus Group, Focus on Energy Evaluated Deemed Savings Changes, November 2014

Operating Hours

While deemed savings are associated with operating hours, savings values are established based on a comparison of heating and cooling degree days for various locations in NY state and Wisconsin. As such, operating hours are not directly applied in the methodology prescribed for this measure, though they are embedded in the derivation of deemed savings. Circulation mode savings and by association, operating hours, are assumed to align with findings of the Wisconsin ECM metering study. Thus, savings associated with circulation-only mode are equivalent across all climate zones.

Effective Useful Life (EUL)

See Appendix P.

CIRCULATOR PUMP – WITH ELECTRONICALLY COMMUTATED (EC) MOTOR, FOR HYDRONIC DISTRIBUTION

Measure Description

This section covers electronically commutated (EC) motors in hydronic distribution circulators. A circulator pump is a specific type of pump used to circulate liquids in a closed distribution system. They are commonly found circulating water in a hydronic heating or cooling system. Because they only circulate liquid within a closed circuit, they only need to overcome the friction of a piping system (as opposed to lifting a fluid from a point of lower potential energy to a point of higher potential energy).

Circulator pumps as used in hydronic systems are usually electrically powered centrifugal pumps. As used in homes, they are often small, sealed, and rated at a fraction of a horsepower, but in commercial applications they range in size up to many horsepower and the electric motor is usually separated from the pump body by some form of mechanical coupling. The sealed units used in home applications often have the motor rotor, pump impeller, and support bearings combined and sealed within the water circuit. This avoids one of the principal challenges faced by the larger, two-part pumps: maintaining a water-tight seal at the point where the pump drive shaft enters the pump body.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times hp \times \left(\frac{1}{Eff_{baseline}}\right) - \left(\frac{1}{Eff_{ee}}\right) \times 0.746 \times hrs$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= The number of measures installed under the program
hp	= Horsepower
Eff	= Efficiency
$_{baseline}$	= Baseline condition or measure
$_{ee}$	= Energy efficient condition or measure
0.746	= Conversion factor (kW/hp), 746 watts equals one electric horsepower
hrs	= Hours

Summary of Variables and Data Sources

Variable	Value	Notes
hp		Circulator motor horsepower, from application
$Eff_{baseline}$	50%	Efficiency of baseline motor
Eff_{ee}	80%	Efficiency of energy efficient motor
hrs	3,240	Circulator pump operating hours, National Grid estimate

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.0.

Baseline Efficiencies from which Savings are Calculated

The baseline efficiency of a standard permanent split-capacitor (PSC) motor is estimated to be 50%. The measure efficiency of a fractional horsepower EC motor is estimated to be 80%. High efficiency circulators may include better impeller design that will increase kWh savings, but may have a negative impact on gas consumption. These effects are ignored.

Compliance Efficiency from which Incentives are Calculated

Operating Hours

Annual heating hours are based on a continuously running circulator. Savings will be less if the circulator cycles on and off with a call for heat.

Effective Useful Life (EUL)

DUCT SEALING AND INSULATION

Measure Description

Sealing and insulation of the space heating and air conditioning duct distribution system in single-family and multi-family homes. This measure reduces leakage into unconditioned and outdoor space improving system efficiency. This measure is to be installed with the assistance of a duct-blaster test on the distribution system.

A duct blaster test, similar in concept to a whole-house blower door test, is turned on to pressurize the duct system to 25 Pascal's (a pressure which represents typical operating pressures for forced-air systems). The airflow through the duct blaster fan (which is displayed in cfm on the duct blaster's manometer) equals the flow escaping through leaks in the duct system. The results are reported as "cfm @ 25 Pascal's".

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times tons/unit \times \left(\frac{12}{SEER}\right) \times EFLH_{cooling} \times \left[1 - \frac{\bar{\eta}_{dist,baseline}}{\bar{\eta}_{dist,ee}}\right]_{cooling} + \left(\frac{kBTUh_{out}}{unit}\right) \times \left(\frac{EFLH_{heating}}{HSPF}\right) \times \left[1 - \frac{\bar{\eta}_{dist,baseline}}{\bar{\eta}_{dist,ee}}\right]_{heating}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times tons/unit \times \left(\frac{12}{EER}\right) \times \left[1 - \frac{\eta_{dist,pk,baseline}}{\eta_{dist,pk,ee}}\right] \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times \left(\frac{kBTUh_{in}}{unit}\right) \times \left(\frac{EFLH_{heating}}{100}\right) \times \left[1 - \frac{\bar{\eta}_{dist,baseline}}{\bar{\eta}_{dist,ee}}\right]_{heating}$$

where:

Δ kWh	= Annual electric energy savings
Δ kW	= Peak coincident demand electric savings
Δtherm	= Annual gas energy savings
units	= Number of measures installed under the program
unit	= Measure
in	= Input capacity
out	= Output capacity
dist	= Distribution
cooling	= Cooling

heating	= Heating
dist	= Distribution
ee	= Energy efficient condition or measure
baseline	= Baseline condition or measure
pk	= Peak
kBTUh	= Annual gas input rating per unit in kBTU/hr
ton/unit	= The nominal rating of the cooling capacity of the air conditioner or heat pump in tons
SEER	= Seasonal average energy efficiency ratio over the cooling season, BTU/watt-hour, (used for average U.S. location/region)
EER	= Energy efficiency ratio under peak conditions
HSPF	= Heating season performance factor
$\bar{\eta}$	= Average energy efficiency (0 -100%)
η	= Energy efficiency (0 -100%)
EFLH	= Equivalent full-load hours
CF	= Coincidence factor
12	= kBTUh/ton of air conditioning capacity
100	= Conversion factor, kBTUh/therm

Summary of Variables and Data Sources

Variable	Value	Notes
AC measure		
tons		From application
SEER	10	Existing unit
	13	New construction
$\eta_{dist, baseline}$	$\bar{\eta}_{dist, baseline}$	
$\eta_{dist, ee}$	$\bar{\eta}_{dist, ee}$	
$\bar{\eta}_{dist, baseline}$	0.956	Statewide cooling average for uninsulated duct with 20% leakage. Use measured leakage if available
$\bar{\eta}_{dist, ee}$		Use statewide average; specs based on new vs. existing construction. Measured leakage OK if available. Use appropriate R-value if duct insulation is also included.
$EFLH_{cooling}$		Vintage weighted average by city.
$EER_{baseline}$	9.2	Existing unit
	11.1	new unit
Heat pump measure		
$kBTUh/unit_{out}$		The nominal output rating of the heating capacity of the heat pump from application
HSPF	6.8	Existing unit
	8.1	New unit

Variable	Value	Notes
Furnace measure		
$kBTUh_{in}$/unit		The nominal input rating of the heating capacity of the furnace from application, from nameplate rated input in kBTU/hr.
$\bar{\eta}_{dist,\ baseline}$	0.934	Statewide average based on uninsulated duct with 20% leakage. Measured leakage OK if available.
$\bar{\eta}_{dist,\ ee}$		Statewide average; specs based on new vs. existing construction. Measured leakage OK if available. Use appropriate R-value if duct insulation is also included.
$EFLH_{heating}$		Vintage weighted average by city.

The SEER is an estimate of the average efficiency of the air conditioner over the cooling season. Most air conditioning equipment installed in residences has a SEER efficiency rating, which is an estimate of the seasonal energy efficiency for an average US city. Programs should use the manufacturers' rated SEER until data can be developed that is more appropriate for NY climates.

The EER is the ARI rated full-load efficiency of the unit, which is used to estimate the unit efficiency under peak conditions.

The HSPF is an estimate of the seasonal heating energy efficiency for an average US city. Programs should use the manufacturers' rated HSPF until data can be developed that are more appropriate for NY climates. See heat pump section for more information.

The cooling and heating season average distribution efficiencies for duct systems in residential buildings across seven New York cities are summarized in Appendix H. Ducts in single-family buildings are assumed to run in an unconditioned basement. Duct systems in low-rise multi-family buildings are assumed to run in an unconditioned space above an insulated ceiling in the top floor units, and through an unconditioned plenum space in the bottom floor units. High-rise buildings generally have hydronic systems.

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.8

Baseline Efficiencies from which Savings are Calculated

Duct systems are assumed to be located in an unconditioned plenum space between insulated finished ceiling and roof surface. The baseline HSPF for heat pumps should be set according to the method described in the sections on heat pump efficiency. The baseline efficiency ($\bar{\eta}_{base}$) for furnaces should be set according to the method described in the sections on furnace efficiency. Distribution system efficiency ($\bar{\eta}_{dist,baseline}$) should be set to the unsealed and uninsulated values from the duct leakage sealing section for the appropriate building type. Use measured data when available. If measured leakage not available use 20% as the default leakage rate. Uninsulated ducts are considered to be the baseline condition.

Compliance Efficiency from which Incentives are Calculated

The measure HSPF for heat pumps should be set according to the section on efficient heat pumps. The measure efficiency ($\overline{\eta}_{ee}$) for furnaces should be set according to the section on efficient furnaces. Distribution system efficiency ($\overline{\eta}_{dist,ee}$) should be based on measured duct leakage if available. If measured leakage not available, use the Air Conditioning Contractors of America (ACCA) Quality Installation (QI) Standard specifications as a default:

Construction type	Duct location	Total Leakage (%)
New	Inside thermal envelope	10%
New	Outside thermal envelope	6%
Existing	All	20% or 50% reduction (whichever is greater)

Operating Hours

Heating equivalent full-load hours calculated from building energy simulation models described in Appendix A. Nameplate capacity for heat pumps should include the full heating capacity of the heat pump system, including backup electric resistance heaters.

Effective Useful Life (EUL)

Years: 18

FURNACE AND BOILER

Measure Description

This measure includes high efficiency gas fired furnaces, boilers, and unit heaters in low-rise residential building applications.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = N/A$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = units \times \frac{kBTUh_{in}}{unit} \times \left(\frac{\eta_{ee}}{\eta_{baseline}} - 1\right) \times \frac{EFLH_{heating}}{100}$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
$kBTUh_{in}$ = Fuel Input Rating
η_{ee} = Efficiency of energy efficient condition or measure
$\eta_{baseline}$ = Efficiency of baseline condition or measure
$EFLH_{heating}$ = Heating equivalent full-load hours
100 = Conversion factor (100 kBTU/Therm)

Summary of Variable and Data Sources

Variable	Value	Notes
$kBTUh_{in}$		Nominal heating input capacity is the nameplate input rating of the unit in kBTU/hr, from application.
$\eta_{baseline}$	See Baseline Efficiency	Baseline established by applicable energy conservation code, climatic zone, equipment type and size, fuel source, as well as system configuration.
η_{ee}	See Compliance Efficiency	From application; use metrics consistent with baseline $EFLH_{heating}$
$EFLH_{heating}$		Lookup based on building type and location, Appendix G

Efficiency is expressed as the ratio between the fuel input relative to the output. The efficiency of furnaces, boilers and unit heaters is customarily evaluated on the basis of one or more of three standards, and are referred to as Thermal Efficiency (E_t), Combustion Efficiency, (E_c) or Annual Fuel Utilization Efficiency (AFUE).

Presently, the AFUE value is only applicable to smaller units. For larger units, use thermal and combustion efficiencies referenced on manufacturer's nameplate data in accordance with nationally recognized standards and testing agencies.

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A.

Baseline Efficiencies From Which Savings are Calculated

The baseline efficiency for residential furnaces, boilers, and unit heaters ($\eta_{baseline}$) is defined by the Code of Federal Regulations and subsequently adopted by the Energy Conservation Code of New York State[169], and the New York City Energy Conservation Code[170] as shown below.

Systems Serving Single-Family Homes or Single Units[171]

Equipment Type	Size Range	ECCCNYS Minimum Efficiency for Climate Zones 4, 5 and 6	NYCECC Minimum Efficiency for NYC Boroughs in Climate Zone 4
Warm Air Furnace, Gas Fired	All Capacities	80% AFUE	80% AFUE
Boiler, Hot Water, Gas Fired	All Capacities	82% AFUE	82% AFUE
Boiler, Steam, Gas Fired	All Capacities	80% AFUE	80% AFUE

	> 2,500 kBtu/h	82% Ec	82% Ec
Boiler, Steam, Gas Fired, All Except Natural Draft	< 300 kBtu/h	75% AFUE	75% AFUE
	≥ 300 kBtu/h and ≤ 2,500 kBtu/h	79% Et	79% Et
	> 2,500 kBtu/h	79% Et	79% Et
Boiler, Steam, Gas Fired, Natural Draft	< 300 kBtu/h	75% AFUE	75% AFUE
	≥ 300 kBtu/h and ≤ 2,500 kBtu/h	77% Et	77% Et
	> 2,500 kBtu/h	77% Et	77% Et

Compliance Efficiencies from Which Incentives are Calculated

Equipment Type	Size Range	Minimum Compliance Efficiency for Climate Zones 4, 5 and 6	Minimum Compliance Efficiency for NYC Boroughs in Climate Zone 4
Warm Air Furnace, Gas Fired	< 225 kBtu/h	92% AFUE	92% AFUE
	≥ 225 kBtu/h	90% Et	90% Et
Warm Air Unit Heaters, Gas Fired	All Capacities	83% Ec	83% Ec
Boiler, Non-Condensing, Hot Water, Gas Fired	< 300 kBtu/h	85% AFUE	85% AFUE
	≥ 300 kBtu/h and ≤ 2,500 kBtu/h	85% Et	85% Et
	> 2,500 kBtu/h	88% Ec	88% Ec
Boiler, Condensing, Hot Water, Gas Fired	< 300 kBtu/h	90% AFUE	90% AFUE
	≥ 300 kBtu/h and ≤ 2,500 kBtu/h	90% Et	90% Et
	> 2,500 kBtu/h	93% Ec	93% Ec
Boiler, Steam, Gas Fired, All Except Natural Draft	< 300 kBtu/h	82% AFUE	82% AFUE
	≥ 300 kBtu/h and ≤ 2,500 kBtu/h	82% Et	82% Et
	> 2,500 kBtu/h	82% Et	82% Et
Boiler, Steam, Gas Fired, Natural Draft	< 300 kBtu/h	82% AFUE	82% AFUE
	≥ 300 kBtu/h and ≤ 2,500 kBtu/h	82% Et	82% Et
	> 2,500 kBtu/h	82% Et	82% Et

Operating Hours

Heating equivalent full-load hours were calculated from a DOE-2.2 simulation of prototypical single and multi-family residential buildings. Operating hour assumptions for the prototypical building models are described in Appendix A. The heating EFLH for commercial buildings in NY are shown in Appendix G.

Effective Useful Life (EUL)

See Appendix P: Effective Useful Life (EUL)

Ancillary Fossil Fuel Savings Impacts

N/A

Ancillary Electric Savings Impacts

High efficiency furnaces may be packaged with high efficiency cooling equipment and/or electronically commutated blower motors, which may provide electricity savings. Draft fans, when present, will increase electricity consumption.

FURNACE TUNE-UP

Measure Description

This measure covers tune-up of residential natural gas furnaces to improve seasonal heating efficiency. A tune-up involves the inspection, cleaning, and or adjustment of furnace and appurtenances per manufacturer's recommendations. This measure addresses tune up benefits associated with heating performance only.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = \Delta therms \times (\Delta kWh/\Delta therms)$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = units \times \frac{kBTUh_{in}}{unit} \times \frac{EFLH_{heating}}{100} \times ESF$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
$kBTUh_{in}$ = Annual gas input rating
EFLH = Equivalent full-load hours
ESF = Energy savings factor
(ΔkWh/ΔTherms) = Annual electric energy savings per unit annual gas energy savings
100 = Conversion factor, one therm equals 100 kBTU

Summary of Variables and Data Sources

Variable	Value	Notes
$kBTUh_{in}$		From application.
$EFLH_{heating}$		Look up based on building type, vintage and location in Appendix G.
ESF	0.05	The energy savings factor for furnace tune-ups is used to estimate the annual heating energy savings.[172]
(ΔkWh/ΔTherms)	0.5	Savings resultant from reduced fan run time due to improved efficiency and cycling of furnace.[173]

[172] Energy savings on the order of 2% - 5% were realized from a boiler tune-up program in the Pacific Northwest. Building Tune-Up and Operations Program Evaluation. Washington State University Energy Program, p. 5.
[173] Electricity Savings from Variable-Speed Furnaces in Cold Climates, Scott Pigg, Energy Center of Wisconsin & Tom Talerico, Glacier Consulting Group

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A.

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a residential gas-fired furnace that has not received a tune-up in 5 years or more.

Compliance Efficiency from which Incentives are Calculated

The compliance condition is a residential gas-fired furnace that has undergone a tune-up in accordance with the manufacturer's recommendations.

Operating Hours

Heating equivalent full-load hours were calculated from a DOE-2.2 simulation of prototypical single and multi-family residential buildings. Operating hour assumptions for the prototypical building models are described in Appendix A. The heating EFLH for commercial buildings in NY are shown in Appendix G.

Effective Useful Life (EUL)

HEAT PUMP - AIR SOURCE (ASHP)

Measure Description

This measure covers the installation of high-efficiency air source heat pumps in residential applications. An air source heat pump is a product, other than a packaged terminal heat pump, which is powered by single phase electric current, air cooled, rated below 65,000 Btu per hour, not contained within the same cabinet as a furnace with rated capacity above 225,000 Btu per hour, and operates as a heat pump. An air source heat pump may consist of a single-package unit or an outdoor unit and one or more indoor units, including multi-head mini-split systems.[174] The baseline case shall be minimally code compliant equipment of the same type and capacity as in the proposed case, which shall be sized in accordance with federal, state and local energy conservation code. Baseline and proposed equipment is assumed to include electric resistance supplemental heating of the same capacity. Thus, although rated capacity and efficiencies used in this measure incorporate supplemental heating elements, no savings are attributed to reduction in electric resistance heating capacity.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = \Delta kWh_{cooling} + \Delta kWh_{heating}$$

$$\Delta kWh_{cooling} = units \times tons/unit \times \left(\frac{12}{SEER_{baseline}} - \frac{12}{SEER_{ee}}\right) \times EFLH_{cooling}$$

$$\Delta kWh_{heating} = units \times \frac{kBTUh_{out}}{unit} \times \left(\frac{1}{HSPF_{baseline}} - \frac{1}{HSPF_{ee}}\right) \times EFLH_{heating} \frac{kBTUh_{out}}{unit} \times \left(\frac{1}{HSPF_{baseline}} - \frac{1}{HSPF_{ee}}\right) \times EFLH_{heating}$$

Peak Coincident Demand Electric Savings

$$\Delta kW = units \times tons/unit \times \left(\frac{12}{EER_{baseline}} - \frac{12}{EER_{ee}}\right) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of units installed under the program
tons/unit	= Tons of air conditioning per unit, based on AHRI certification or nameplate data

[174] 10 CFR 430.2

of condenser or matched pair (condenser and coil)

$kBTUh_{out}/unit$ = The nominal rating of the heating output capacity of the heat pump in kBTU/hr (including supplemental heaters) per unit, based on AHRI certification or nameplate data of condenser or matched pair (condenser and coil)

ee = Energy efficient condition or measure

baseline = Baseline condition or measure

HSPF = Heating seasonal performance factor, BTU/watt-hour, total heating output (supply heat) in BTU (including supplemental heaters) during the heating season / total electric energy heat pump consumed (in watt-hour)

SEER = Seasonal average energy efficiency ratio over the cooling season, BTU/watt-hour, used for average U.S. location/region

EER = Energy efficiency ratio under peak conditions

EFLH = Equivalent full-load hours

CF = Coincidence factor

12 = kBTUh/ton of air conditioning capacity

Summary of Variables and Data Sources

Variable	Value	Notes
tons		From application, default to average system size from applications if unknown
$kBTUh_{out}$		From application
$SEER_{baseline}$		Lookup from Baseline Efficiencies table below based on product class and size.
$SEER_{ee}$		From application
$EFLH_{cooling}$		Lookup based on building type, vintage and location from Appendix G.
$HSPF_{baseline}$		Lookup from Baseline Efficiencies table below based on product class and size.
$HSPF_{ee}$		From application
$EFLH_{heating}$		Lookup based on building type, vintage and location from Appendix G.
$EER_{baseline}$		Lookup from Baseline Efficiencies table below based on product class and size.
EER_{ee}		From application
CF	0.69	

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.69.[175]

Baseline Efficiencies from which Savings are Calculated

[175] Based on BG&E 'Development of Residential Load Profile for Central Air Conditioners and Heat Pumps' research, the Maryland Peak Definition coincidence factor is 0.69. This study is not publicly available, but is referenced by the Mid-Atlantic TRM Version 7.0 published May 2017 and by M. M. Straub, Using Available Information for Efficient Evaluation of Demand-Side Management Programs, Electricity Journal, September 2011 and supported by research conducted by Cadmus on behalf of the TRM Management Committee.

The baseline condition is an air source heat pump as defined in the Measure Description section above, with rated SEER, EER and HSPF per the table below. The SEER and HSPF values listed in the table below reflect the minimum performance required by federal standards. Minimum EER requirements are not specified by federal standards for the state of New York, nor are they mandated by state or city code for residential equipment. For this equipment, baseline EER is established as follows[176]:

$$EER = (1.12 \times SEER) - (0.02 \times SEER^2)$$

Resultant values from application of this equation are tabulated in the baseline efficiencies table below.

Product Class	Seasonal Energy Efficiency Ratio (SEER)[177]	Energy Efficiency Ratio (EER)	Heating Seasonal Performance Factor (HSPF)[178]
Split System – Heat Pump (<45 kBTUh)	14.0	11.8	8.2
Split System – Heat Pump (≥45 and < 65 kBTUh)	14.0	11.8	8.2
Single Package – Heat Pump	14.0	11.8	8.0

Compliance Efficiency from which Incentives are Calculated

The compliance condition is an air source heat pump as defined in the Measure Description section above meeting minimum performance requirements dictated by program guidelines.

Operating Hours

Cooling and heating EFLH data by location, building type and vintage are tabulated in Appendix G.

Effective Useful Life (EUL)

See Appendix P.

Ancillary Fossil Fuel Savings Impacts

Minor heating interactions are expected with efficient furnace fans utilized in most high efficiency air conditioners. These impacts are expected to be negligible and have not been addressed in the prescribed methodology at this time.

HEAT PUMP – GROUND SOURCE (GSHP)

Measure Description

This measure covers the installation of a ground source heat pump (GSHP) system with a closed loop heat exchanger field, which provides heating and cooling for space conditioning by the water to air transference of ground temperatures through a typical air-duct distribution system in a detached single-family residential home. This measure applies to GSHPs with a rated cooling capacity of <65,000 BTU/h. The baseline efficiency used for a GSHP is the efficiency level of the minimally code compliant replacement equipment for the existing heating and cooling systems. The GSHP analysis associated with this measure is based on several assumptions consistent with best practice design for a detached single-family residential building:

ECCCNYS states systems shall be sized in accordance with ACCA Manual S based on building loads calculated in accordance with ACCA Manual J or other approved heating and cooling calculation methodologies.[179]

The building peak heating load in New York typically exceeds the peak cooling load, therefore it is assumed that the GSHP runs at part-load during peak cooling hours.

The ground loop heat exchanger is adequately sized and installed properly to allow the GSHP to meet the peak heating load without electric resistance auxiliary heat.

The GSHP is equipped with either a two stage or variable speed compressor system, a variable speed or constant speed ground loop circulator pump, and a variable-speed blower distribution fan. This is a compliance requirement for application of this measure.

The GSHP efficiency is rated in accordance with ISO-13256, and performance tables are provided by the manufacturer showing the efficiency and capacity of the unit under full and part load conditions.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = \left\{ \begin{array}{c} \left[ACL \times \frac{1}{1{,}000} \times \left(\frac{F_{CEC}}{EER_{baseline}} - \frac{1}{EER_{part\ adj,ee}} \right) \times EFLH_{cooling} \times F_{EFLH} \right] \\ + \\ \left[AHL \times \frac{1}{1{,}000} \times \left(\frac{F_{EH}}{COP_{baseline}} - \frac{1}{COP_{part\ adj,ee}} \right) \times \frac{EFLH_{heating} \times F_{EFLH}}{3.412} \right] \end{array} \right\}$$

Peak Coincident Demand Savings

$$\Delta kW = \left\{ ACL \times \frac{1}{1{,}000} \times \left(\frac{F_{CEC}}{EER_{baseline}} - \frac{1}{EER_{part\ adj,ee}} \right) \right\} \times CF$$

[179] ECCCNYS 2016, Section R403.7

Annual Gas Energy Savings

$$\Delta therms = units \times \left\{ AHL \times \frac{1}{100{,}000} \times \frac{F_{GH}}{AFUE_{baseline}} \times EFLH_{heating} \times F_{EFLH} \right\}$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand savings
Δtherm	= Annual fossil fuel savings
ACL	= Actual cooling load (BTU/h)
AHL	= Actual heating load (BTU/h)
F_{CEC}	= Central electric cooling factor; used to account for the presence or absence of a central electric cooling system
F_{EH}	= Electric heating factor; used to account for the presence or absence of an electric heating system
F_{GH}	= Gas heating factor; used to account for the presence or absence of a gas heating system
baseline	= Baseline condition or measure
ee	= Energy efficient condition or measure
EER	= Energy efficiency ratio (BTU/W-hour)
COP	= Coefficient of performance, ratio of output energy/input energy
$EER_{part\ adj}$	= Energy efficiency ratio (BTU/W-hour) at part-load adjusted for fan and pump power
$COP_{part\ adj}$	= Coefficient of performance, ratio of output/input energy at part-load adjusted for fan and pump power
AFUE	= Annual fuel utilization efficiency, seasonal efficiency for fuel heat equipment
EFLH	= Equivalent full-load hours
F_{EFLH}	= Adjustment factor to account for oversizing assumption embedded in EFLH
CF	= Coincidence Factor
1,000	= Conversion factor, one kW equals 1,000 Watts
3.412	= Conversion factor, one watt-hour equals 3.412142 BTU
100,000	= Conversion factor, (BTU/therm), one therm equals 100,000 BTU's

Summary of Variables and Data Sources

Variable	Value	Notes
ACL		Determine based on Manual J calculation.
AHL		Determine based on Manual J calculation.
F_{CEC}		If a central electric cooling system is present, set equal to 1. Otherwise, set equal to 0.
F_{EH}		If a central electric heating system is present, set equal to 1. Otherwise, set equal to 0.
F_{GH}		If a central gas heating system is present, set equal to 1. Otherwise, set equal to 0.

Variable	Value	Notes
$EER_{baseline}$		Electric cooling energy efficiency rating of baseline equipment. See Baseline Efficiency section below for details.
$COP_{baseline}$		Electric heating energy efficiency rating of baseline equipment. See Baseline Efficiency section below for details.
$EER_{part\ adj,\ ee}$		Energy efficiency ratio from the manufacturer's catalog data adjusted to account for applied fan and pump power. See Compliance Efficiency section below for details.
$COP_{part\ adj,\ ee}$		Coefficient of performance (ratio of heat delivered to energy input to the compressor) from the manufacturer's catalog data adjusted to account for applied fan and pump power. See Compliance Efficiency section below for details.
$AFUE_{baseline}$		Gas heating energy efficiency rating of baseline equipment. See Baseline Efficiency section below for details.
EFLH		Lookup based on building type and location from Appendix G
F_{EFLH}	1.25	Adjustment factor to EFLH to account for oversizing assumption embedded in EFLH data presented in Appendix G. (see Operating Hours section below)

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.69.[180]

Baseline Efficiencies from Which Savings are Calculated

The baseline efficiency used for a GSHP is the efficiency level of the minimally code compliant replacement equipment for the existing heating and cooling systems. The minimally code compliant efficiency level shall comply with the requirements of the current state code, or under state law, an equal or more stringent code or standard adopted by the municipality or jurisdiction applicable to the installation site.

For example, the baseline efficiency level for a 3-ton GSHP with existing equipment in a normal/end-of-life replacement scenario in New York State (and where more stringent code is not enforced) would be: 1) For electric equipment, a split-system air conditioner with a SEER of 13[181]

[180] Based on BG&E 'Development of Residential Load Profile for Central Air Conditioners and Heat Pumps' research, the Maryland Peak Definition coincidence factor is 0.69. This study is not publicly available, but is referenced by the Mid-Atlantic TRM Version 7.0 published May 2017 and by M. M. Straub, Using Available Information for Efficient Evaluation of Demand-Side Management Programs, Electricity Journal, September 2011 and supported by research conducted by Cadmus on behalf of the TRM Management Committee. The TRM MC continues to coordinate with the New York Geothermal Energy Organization ("NY GEO") regarding right sizing adjustment factors and the use of coincidence factor.

[181] 10 CFR 430.32 (c)(1)(i)

or an air-source heat pump with a SEER of 14 and HSPF of 8.2[182]; 2) For fossil fuel equipment, with an existing natural gas furnace, an equivalent baseline efficiency, stated as the Annual Fuel Utilization Efficiency (AFUE), would be 80%[183]. Note, the baseline efficiency for electric resistance heat is a COP of 1.0. For electric resistance heating, no fan or pump power is considered.

Current code (Code of Federal Regulations 10 CFR 430.32, ECCCNYS 2016, NYCECC 2016 or local legislation) applicable to the installation site should be consulted for correct baseline system and efficiency values.

The baseline electric cooling efficiency term used for this measure is in terms of EER. Minimum EER requirements are not specified by federal standards for the state of New York, nor are they mandated by state or city code for residential equipment. For this equipment, baseline EER is established as follows[184]:

$$EER = (1.12 \times SEER) - (0.02 \times SEER^2)$$

Air source heat pumps are rated under a standard set of conditions. For cooling, the differences between the rated conditions and those in New York are small, however for heating, the differences between the rated conditions and those experienced in New York are significant. To account for these differences during the heating season, a climate-adjustment factor, as defined in the table below, must be used to define the project baseline when that baseline is an air source heat pump.

The HSPF is the AHRI rated heating seasonal average efficiency expressed in terms of BTU/hr-watt. A seasonal average adjusted part-load COP of an air-source heat pump is used in the above equations. This baseline/adjusted part-load COP shall be calculated as:

$$COP_{baseline} = COP_{part\ adj} = \frac{HSPF \times F_{HSPF}}{3.412}$$

where:

$COP_{part\ adj}$ = Seasonal average adjusted COP of air-source heat pump

HSPF = Heating seasonal performance factor of the baseline system, total heating output (supply heat) in BTU (including electric heat) during the heating season / total electric energy heat pump consumed (in watt/hr)

F_{HSPF} = HSPF Climate Adjustment Factor, from table below

3.412 = Conversion factor, one watt-hour equals 3.412142 BTU

HSPF Climate Adjustment Factor (F_{HSPF})

City	HSPF < 8.5	HSPF ≥ 8.5
Albany	0.70	0.67
Binghamton	0.68	0.65
Buffalo	0.73	0.70

182 10 CFR 430.32 (c)(1)(ii)

183 10 CFR 430.32 (e)(2)(i)(A) – Assumes an 80 MBh gas furnace.

184 DOE, Building America House Simulation Protocols, October 2010

City	HSPF < 8.5	HSPF ≥ 8.5
Massena	0.59	0.56
NYC	0.80	0.78
Poughkeepsie	0.62	0.59
Syracuse	0.69	0.66

Compliance Efficiency from which Incentives are Calculated

The compliance condition is a ground source heat pump system as defined in the Measure Description section above meeting or exceeding minimum performance requirements dictated by program eligibility guidelines.

Ground source heat pumps are rated according to ISO-13256. The efficiency specifications in ISO-13256 account for the compressor energy and supply fan, and pump energy required to overcome air and fluid pressure drop internal to the unit. The analysis is based on the actual building heating and cooling loads from a Manual J calculation, rather than the installed equipment nameplate capacity. Thus, the analysis uses an adjustment factor to remove the embedded oversizing assumptions in the Appendix G EFLH data. The ISO-13256 efficiency rating procedure addresses the efficiency of the GSHP only, not the entire system. The fan energy required to distribute air through the duct system and the pump energy required to move the heat transfer fluid through the ground loop is accounted for separately in this analysis.

The seasonal average cooling and heating efficiencies are estimated from the manufacturers' catalog EER and COP data at the cooling and heating seasonal average entering fluid temperature and capacity. EER and COP ratings provided in manufacturers' catalogs were developed under conditions specified in ISO 13256, which do not include fan and pump power external to the unit. An adjustment factor is applied to the manufacturers' catalog data to account for fan and pump power:

$$EER_{part\ adj} = \left(EER_{part}\ at\ GWT_{cooling}\right) \times F_{cooling}$$

$$COP_{part\ adj} = \left(COP_{part}\ at\ GWT_{heating}\right) \times F_{heating}$$

Summary of Variables and Data Sources

Variable	Value	Source
$GWT_{cooling}$	60 °F	Heat pump entering water temperature. Data source; monitored ground loop temperature data from geothermal heat pump systems installed in NY (see reference 7). The data was recorded on a daily basis over a 12-month period, including a full cooling season.
$GWT_{heating}$	40 °F	Heat pump entering water temperature. Data source; monitored ground loop temperature data from geothermal heat pump systems installed in NY (see reference 7). The data was recorded on a daily basis over a 12-month period, including a full heating season.
$F_{cooling}$		Adjustment factor to the manufacturers' catalog data is applied to account for fan and pump power consumption during cooling mode

Variable	Value	Source
$F_{heating}$		Adjustment factor to the manufacturers' catalog data is applied to account for fan and pump power consumption during heating mode

Data concerning the external static pressure (ESP) imposed on the unit during ISO testing are not generally available. It is assumed that the ESP during the test is representative of the ESP of a typical duct system. Pump power for a well-designed system from the ASHRAE Geothermal Heating and Cooling System Design Guide is shown below:

Installed Pump Power	Power into Pump Motor	Grade	Available Head with 70% Efficient Pump at 3gpm/ton
<5hp/100 tons	< 45 W/ton	A	< 46 ft. of water

The EER and COP ratings provided in manufacturers' catalogs were developed under conditions specified in ISO 13256, which do not include fan and pump power external to the unit. An adjustment factor to the manufacturers' catalog data as a function of external pumping power are shown below for variable-speed and constant two-speed ground-water pumping systems:

Heat Pump Type	Stage	Pump power (W/ton)	Pump Type	$F_{cooling}$	$F_{heating}$
Variable	Low	45	Variable flow	0.85	0.93
Two-stage	Low	45	Variable flow	0.84	0.91
Variable	Low	45	Constant flow	0.75	0.86
Two-Stage	Low	45	Constant flow	0.8	0.88

Operating Hours

Operating hours are based on EFLH as presented in Appendix G. Note, the EFLH data in Appendix G are based on system nameplate capacity, while the equations in this section are based on actual building load. The F_{EFLH} factor is introduced to account for the equipment oversizing assumption embedded in the Appendix G data. The oversizing assumption embedded in the Appendix G data are appropriate for equipment sized to meet the peak-cooling load, such as central air conditioners and air source heat pumps. However, GSHPs are typically sized to meet the heating load; and the oversizing assumptions embedded in the Appendix G data are not appropriate.

Effective Useful Life (EUL)

See Appendix P.

HEATING, VENTILATION AND AIR CONDITIONING (HVAC) – CONTROL

OUTDOOR RESET CONTROL FOR HYDRONIC BOILER

Measure Description

Reset of hot water set point in single and multi-family residential buildings with zone thermostat control. The measure is assumed to be applied to existing non-condensing boiler systems. One outdoor reset control measure may be applied to each boiler unit.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$\Delta kWh = N/A$

Peak Coincident Demand Savings

$\Delta kW = N/A$

Annual Gas Energy Savings

$$\Delta therms = units \times \left(\frac{kBTUh_{in}}{unit}\right) \times \left(\frac{EFLH_{heating}}{100}\right) \times F_{savings}$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of reset controls installed under the program
EFLH = Equivalent full-load hours
in = Input capacity
heating = Heating
CF = Coincidence factor
KBTUh = Annual gas input rating per unit in kBTU/hr
$F_{savings}$ = Savings factor
100 = Conversion factor, (kBTUh/therm)

Summary of Variables and Data Sources

Variable	Value	Notes
$kBTUh_{in}$/unit		From application. Use deemed value of 110 kBTU/hr if data not available. If vintage not known, use vintage weighted values.
$EFLH_{heating}$		Lookup by vintage and city. If vintage not known, use vintage weighted values.

Variable	Value	Notes
$F_{savings}$	0.05	Recommended Energy Factor for boiler reset controllers in residential applications

The input capacity (in 1,000 BTU/hr) of the boiler should be taken from the application. If the input capacity is not known, then use the following default values:

1. Single-family residential buildings, 110 kBTU/hr
2. Multi-family buildings, input capacity can be estimated from the building type (low-rise or high-rise) and the building heated floor area using the data in the table below.

City and Vintage	Boiler Size (BTU/hr-SF)	
	High-rise (more than 3 stories)	Low-rise (3 stories or less)
Albany old vintage	20.2	26.0
Albany average vintage	15.4	17.0
Albany new vintage	9.9	10.0
Buffalo old vintage	18.0	23.5
Buffalo average vintage	13.8	14.9
Buffalo new vintage	8.8	9.1
Massena old vintage	22.7	28.8
Massena average vintage	17.7	18.8
Massena new vintage	11.3	11.2
NYC old vintage	13.7	19.2
NYC average vintage	10.6	11.8
NYC new vintage	6.8	7.6
Syracuse old vintage	18.6	24.6
Syracuse average vintage	14.3	15.8
Syracuse new vintage	9.1	9.5
Binghamton old vintage	19.0	24.6
Binghamton average vintage	14.6	15.9
Binghamton new vintage	9.3	9.5
Poughkeepsie old vintage	17.1	22.6
Poughkeepsie average vintage	13.2	14.4
Poughkeepsie new vintage	8.4	8.8

Coincidence Factor (CF)

The recommended value for the coincidence factor is: N/A

Baseline Efficiencies from which Savings are Calculated

Constant hot water set point temperature of 180F^o.

Compliance Efficiency from which Incentives are Calculated

Reset hot water temperature to 160F^o. Energy Factor ($F_{savings}$) of 0.05 shall be used.

Operating Hours

Heating equivalent full-load hours for residential buildings were calculated from DOE-2.2 simulations of prototypical single-family buildings. See Appendix G.

Effective Useful Life (EUL)

Years: 15 Source: ACEEE

Ancillary Fossil Fuel Savings Impacts

Ancillary Electric Savings Impacts

Lower set point temperature may cause hot water circulator to run longer cycles. Minor impact not accounted for in this procedure.

SUB-METERING

Sub-metering of apartments in multi-family buildings, where tenants pay for their own electricity consumption according to their metered usage.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$kWh = units \times kWh/SF \times SF \times ESF$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
CF	= Coincidence factor
kWh/SF	= Annual electricity consumption per SF of conditioned floor area
SF	= Conditioned floor area per apartment subject to sub-metering
ESF	= Energy savings factor from sub-metering

Summary of Variables and Data Sources

Variable	Value	Notes
ESF	0.08	Default value, annual energy consumption per square foot of conditioned floor area should come from utility data specific to the multi-family housing stock in their service territory.

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A

Baseline Efficiencies from which Savings are Calculated

There is a significant research literature substantiating the belief that sub-metering of master-metered multi-family buildings can result in significant energy savings (see Munley et al, 1990 and Hackett & Lutzenheiser, 1991). However, rigorous estimates of the percentage of savings to be expected are scarce. A rigorous study of water sub-metering commissioned by the EPA (Aquacraft 2004) found savings of approximately 15%. While water is not electricity, arguably the same behavioral impulses can be expected to be at work. Recent NYSERDA program submittals suggested an 8% savings in total energy consumption. 8% seems to be a reasonable, albeit relatively conservative, default assumption. However, given the scarcity of recent, reliable studies, it is particularly important that savings claims from sub-metering be rigorously evaluated through ex-post studies.

LEARNING THERMOSTAT

Measure Description

This measure covers the installation of ENERGY STAR® qualified smart thermostats with behavioral learning capabilities applied to single-family and multi-family residential HVAC systems. Utilizing Wi-Fi connections, a smart (learning) thermostat provides and receives feedback from users to enhance energy efficiency without compromising comfort. A learning thermostat controls HVAC equipment to regulate the temperature of the room or space in which it is installed, communicates with sources external to the HVAC system for remote adjustment and has the ability to perform automatic adjustments in response to occupant behavior. Additional learning thermostat capabilities may vary, but at minimum, must meet the following criteria:

- Work as a basic thermostat in absence of connectivity to the service provider.
- Give residents some form of feedback about the energy consequences of their settings.
- Provide information about HVAC energy use, such as monthly run time.
- Provide the ability to set a schedule.
- Provide the ability to work with utility programs to prevent brownouts and blackouts, while preserving consumers' ability to override those grid requests.[185]

This measure is applicable to single and multi-family centralized heating and cooling systems. For single family applications with multiple zones, savings are claimed per residence. While incentives may be provided for multiple thermostat units, the algorithms below shall apply a value of "1" to the "units" term. For multifamily applications, "tons/unit", "$kBTUh_{out}$/unit" and "$kBTUh_{in}$/unit" terms shall be set equal to the total capacity of the central cooling/heating system divided by the total number of dwelling units served by the system. The "units" term shall be set equal to the total number of dwelling units in which learning thermostats are installed. This measure is not applicable to multifamily central heating systems with additional capacity for domestic hot water.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times \left[\begin{array}{l} \left(tons/unit \times \dfrac{12}{Eff_{cooling}} \times EFLH_{cooling} \times ESF_{cooling} \times F_{CEC} \right) \\ + \left(kBTUh_{out}/unit \times \dfrac{1}{HSPF} \times EFLH_{heating} \times ESF_{heating} \times F_{EH} \right) \end{array} \right]$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

[185] ENERGY STAR® Program Requirements Product Specification for Connected Thermostat Products, Eligibility Criteria Version 1.0, January 2017

$$\Delta therms = units \times \left(kBTUh_{in}/unit \times \frac{1}{100} \times EFLH_{heating} \times ESF_{heating} \times F_{GH}\right)$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas savings
units	= Number of residences in which the measure is installed under the program
tons/unit	= Tons of air conditioning per residence, based on nameplate data; for multifamily buildings with centralized HVAC, this term shall be set equal to the total cooling capacity of the system divided by the total number of dwelling units it serves
$kBTUh_{out}$/unit	= Output electric heating capacity in kBTU/h per residence, based on nameplate data; for multifamily buildings with centralized HVAC, this term shall be set equal to the total heating capacity of the system divided by the total number of dwelling units it serves
$kBTUh_{in}$/unit	= Input heating capacity in kBTU/h per residence, based on nameplate data; for multifamily buildings with centralized HVAC, this term shall be set equal to the total heating capacity of the system divided by the total number of dwelling units it serves
$Eff_{cooling}$	= Seasonal average energy efficiency over the cooling season, BTU/watt-hour, (used for average U.S. location/region), using either SEER (<5.4 tons) or IEER (≥5.4 tons)
HSPF	= Seasonal average energy efficiency over the heating season, Heating seasonal performance factor, BTU/watt-hour, total heating output (supply heat) in BTU (including resistance heat) during the heating season / total electric energy heat pump consumed (in watt-hour); if equipment efficiency is reported in COP, convert to HSPF using the equivalency HSPF = COP x 3.412
EFLH	= Equivalent full-load hours
ESF	= Energy savings factor
F_{CEC}	= Central electric cooling factor; used to account for the presence or absence of a central electric cooling system
F_{EH}	= Electric heating factor; used to account for the presence or absence of an electric heating system
F_{GH}	= Gas heating factor; used to account for the presence or absence of a gas heating system
12	= kBTUh/ton of air conditioning capacity
100	= Conversion factor, one therm equals 100 kBTU

Summary of Variables & Data Sources

Variable	Value	Notes
tons/unit		From application or use 3 tons as a default.[186]
$kBTUh_{out}$/unit		From application or use 72 kBTUh as a default.[187]
$kBTUh_{in}$/unit		From application or use 90 kBTUh as a default.[188]
$Eff_{cooling}$		From application or use 14 SEER, assuming a 3-ton central ASHP system.[189]
HSPF		From application or use 8.2 HSPF, assuming a 3-ton central ASHP system. [190] For electric resistance heating and electric furnaces, use 3.4 HSPF. If taken from application, COP must be converted to HSPF using the equivalency HSPF = COP x 3.412.
$EFLH_{cooling}$		Look up based on building type, vintage and city in Appendix G.
$EFLH_{heating}$		Look up based on building type, vintage and city in Appendix G.
$ESF_{cooling}$	0.10	Energy savings factor for cooling.[191]
$ESF_{heating}$	0.08	Energy savings factor for heating.[192]
F_{CEC}	Central Cooling: 1 No Central Cooling: 0 Unknown: 0.39	Based on EIA Residential Energy Consumption Survey (RECS) 2015 for Middle Atlantic States.[193]
F_{EH}	Electric Heating: 1 No Electric Heating: 0 Unknown: 0.15	Based on EIA Residential Energy Consumption Survey (RECS) 2015 for Middle Atlantic States.[194]
F_{GH}	Gas Heating: 1 No Gas Heating: 0 Unknown: 0.60	Based on EIA Residential Energy Consumption Survey (RECS) 2015 for Middle Atlantic States.[195]

[186] Assumes a 1,800 ft^2 home with 20 BTUh/ft^2 cooling load: 1,800 ft^2 x 20 BTUh/ft^2 x 1/12,000 ton/BTUh = 3 tons
[187] Assumes a 1,800 ft^2 home with 40 BTUh/ft^2 heating load: 1,800 ft^2 x 40 BTUh/ft^2 x 1/1,000 kBTUh/BTUh = 72 kBTUh
[188] Assumes a 1,800 ft^2 home with 40 BTUh/ft^2 heating load and 80% AFUE: 1,800 ft^2 x 40 BTUh/ft^2 x 1/0.80 x 1/1,000 kBTUh/BTUh = 90 kBTUh

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A.

Baseline Efficiencies from which Savings are Calculated

The baseline condition is an HVAC system controlled by a programmable thermostat without Wi-Fi or behavioral learning capability.

Compliance Efficiency from which Incentives are Calculated

The compliance condition is an HVAC system controlled by an ENERGY STAR® qualified Wi-Fi communicating thermostat with behavioral learning capability as defined in the Measure Description section above.

Operating Hours

Cooling and heating equivalent full-load hours were calculated from a DOE-2.2 simulation of prototypical single and multi-family residential buildings. Operating hour assumptions for the prototypical building models are described in Appendix A. The heating EFLH for commercial buildings in NY are shown in Appendix G.

Effective Useful Life (EUL)

See Appendix P.

Ancillary Fossil Fuel Savings Impacts

N/A

Ancillary Electric Savings Impacts

Reduced operating hours during the heating and cooling season result in distribution blower electric savings. These effects are not quantified in the prescribed savings estimation methodology for this measure at this time.

THERMOSTAT – PROGRAMMABLE SETBACK

Measure Description

Programmable setback thermostats applied to single-family and multi-family residential air conditioners, heat pumps, boilers, furnaces and electric resistance baseboard heating systems.

One programmable thermostat may be applied to each controlled HVAC system.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times \left[\begin{array}{l} \left(tons/unit \times \left(\frac{12}{SEER} \right) \times EFLH_{cooling} \times F_{cooling} \right) \\ + \left(kBTUh_{out}/unit \times \left(\frac{1}{HSPF} \right) \times EFLH_{heating} \times F_{heating} \right) \end{array} \right]$$

Peak Coincident Demand Savings

$\Delta kW = N/A$

Annual Gas Energy Savings

$$\Delta therms = units \times \left[kBTUh_{in}/unit \times \left(\frac{1}{100} \right) \times EFLH_{heating} \times F_{heating} \right]$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
$\Delta therms$ = Annual gas energy savings
units = Number of residences in which measure is installed under the program
tons/unit = Tons of air conditioning per residence, based on nameplate data; for multifamily with central HVAC, this includes all residences served by central HVAC system
$kBTUh_{out}$/unit = Output electric heating capacity in kBTU/h per residence, based on nameplate data (heat pumps); for multifamily with central HVAC, this includes all residences served by central HVAC system
$kBTUh_{in}$/unit = Input heating capacity in kBTU/h per residence, based on nameplate data (boilers, furnaces and electric resistance heating); for multifamily with central HVAC, this includes all residences served by central HVAC system
SEER = Seasonal energy efficiency ratio in Btu/watt-hour. Total cooling output of an air conditioner during its normal annual usage period for cooling, in BTU, divided by the total electric energy input during the same period, in watt-hours.
HSPF = Heating seasonal performance factor, total heating output (supply heat) in BTU (including electric strip heat) during the heating season / total electric energy heat pump consumed (in watt/hr)

$EFLH_{cooling}$ = Cooling equivalent full-load hours
$EFLH_{heating}$ = Heating equivalent full-load hours
$F_{heating}$ = Energy savings factor for heating (percent of total consumption saved)
$F_{cooling}$ = Energy savings factor for cooling (percent of total consumption saved)
12 = kBTUh/ton of air conditioning capacity
100 = Conversion factor, kBTUh/therm

Summary of Variables and Data Sources

Variable	Value	Notes
tons		From application or use 3 as default. Use 0 if no central cooling
SEER	13	As defined by IECC 2015 and subsequently adopted by ECCCNYS 2016 and NYCECC; assumes 3-ton, split system AC[196]
$EFLH_{cooling}$		Vintage weighted average by city.
$F_{cooling}$	0.09	
$EFLH_{heating}$		Vintage weighted average by city.
$F_{heating}$	0.02	Conservative estimate based on results of NYS RES HEHE evaluation[197]
If heat pump:		
$kBTUh_{out}$/unit		From application or use 70 kBTU/hr as default
HSPF	8.2	As defined by IECC 2015 and subsequently adopted by ECCCNYS 2016 and NYCECC; assumes 3-ton, split system HP[198]
If furnace:		
$kBTUh_{in}$/unit		From application or use 90 kBTU/hr as a default. Use weighted average of furnace and boiler if system type unknown.
If boiler:		
$kBTUh_{in}$/unit		From application or use 110 kBTU/hr as default. Use weighted average of furnace and boiler if system type is unknown.
If resistance heater:		
$kBTUh_{in}$/unit		From application or use 12 kBTU/hr (3.5 kW) as default
HSPF	3.412	Equivalent to COP = 1

The nominal rating of the cooling capacity of the air conditioner or heat pump should be set equal to the rated capacity of all cooling equipment in the residence. The energy savings should

[196] IECC 2015; Table C403.2.3(1): Minimum Efficiency Requirements: Electrically Operated Unitary Air Conditioners and Condensing Units
[197] Opinion Dynamics: New York Statewide Residential Gas High-Efficiency Heating Equipment Programs Evaluation of 2009-2011 Programs; August 2014
[198] IECC 2015; Table C403.2.3(2): Minimum Efficiency Requirements: Electrically Operated Unitary and Applied Heat Pumps

be calculated based on the capacity of the HVAC system, with one thermostat controlling the system. For multifamily with central HVAC, total cooling capacity of the system should be used.

The nominal rating of the heating capacity of the heat pump should be set equal to the rated capacity of all heating equipment controlled in the residence. The energy savings should be calculated based on the capacity of the HVAC system, with one thermostat controlling the system. For multifamily with central HVAC, total heating capacity of the system should be used.

Coincidence Factor (CF)
The recommended value for the coincidence factor is: N/A

Baseline Efficiencies from which Savings are Calculated
The baseline system is a standard, non-programmable thermostat for a central heating and cooling system when a programmable thermostat is not otherwise required by applicable energy conservation code. If programmable thermostats are required by code, no deemed savings exist.

The baseline efficiency for air conditioners and heat pumps should be set according to the sections on air conditioner and heat pump efficiency above. Electric resistance heating systems should use an HSPF = 3.412, which is equivalent to a coefficient of performance of 1.0.
Studies of residential heating thermostat set point behavior indicate some amount of manual setback adjustment in homes without programmable thermostats. This behavior is accounted for in the prototypical building simulation model used to calculate heating equivalent full-load hours, as described in Appendix A. An assumption of 3°F of night time setback behavior is embedded in the models.

Compliance Efficiency from which Incentives are Calculated
The energy savings factor for heating ($F_{heating}$) is the ratio of the energy savings resulting from installation of a programmable setback thermostat to the annual heating energy. The heating energy savings factor assumption is derived from the results of a New York State specific residential gas program evaluation conducted by Opinion Dynamics. This evaluation indicated a 2-4% reduction in total annual gas consumption resulting from installation of programmable thermostats. A conservative value of 2% of the annual heating energy consumption is assumed as deemed savings for programmable setback thermostats in residential applications.

The cooling energy savings factor ($F_{cooling}$) is the ratio of the energy savings resulting from installation of a programmable setback thermostat to the annual cooling energy. The cooling energy savings factor assumption is taken from the ENERGY STAR® website. The ENERGY STAR® calculator estimates an energy savings of 6% of the annual cooling energy consumption per degree of setback for programmable setback thermostats in residential applications. This measure assumes an average of 1.5 degrees of setback over the cooling season for an estimated annual cooling energy savings of 9%.

Operating Hours
Cooling and heating equivalent full-load hours calculated from building energy simulation models are described in Appendix A and summarized in Appendix G.

THERMOSTAT – WI-FI (COMMUNICATING)

Measure Description

This section covers Wi-Fi communicating thermostats without behavioral learning capability applied to single-family and multi-family residential air conditioners, heat pumps, boilers, furnaces and electric resistance baseboard heating systems. These communicating thermostats allow set point adjustment via a remote application. This measure does not apply to Wi-Fi thermostats installed as part of a Demand Response program.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings (Cooling)

$$\Delta kWh = units \times kWh/unit$$

Peak Coincident Demand Savings

$$\Delta kW = units \times kW/unit$$

Annual Gas Energy Savings

$$\Delta therms = units \times therms/unit$$

where:

ΔkWh	= Annual electricity energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
kWh/unit	= Annual electric savings per unit
kW/unit	= Peak coincident demand savings per unit
therms/unit	= Annual gas savings per unit

Summary of Variables and Data Sources

Variable	Value	Notes
kWh/unit	104	Annual electric savings per installed thermostat, in kWh[200]
kW/unit	0.23	Peak demand savings per installed thermostat, in kW[201]
therms/unit	66	Annual gas savings per installed thermostat, in therms[202]

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A.

[200] Cadmus Group, Wi-Fi Programmable Controllable Thermostat Pilot Program Evaluation, September 2012
[201] Ibid.
[202] Ibid.

Baseline Efficiencies from which Savings are Calculated

The baseline efficiency is an HVAC system using natural gas and electricity to provide space heating and cooling controlled by a non-Wi-Fi communicating programmable thermostat.

Compliance Efficiency from which Incentives are Calculated

The compliance efficiency is an HVAC system using natural gas and electricity to provide space heating and cooling controlled by a Wi-Fi communicating thermostat without behavioral learning capability. The thermostat shall not be installed as part of a Demand Response program.

Operating Hours

HVAC system operating hours are embedded in the deemed savings values associated with Wi-Fi communicating thermostats, which are based on metering results.

THERMOSTATIC RADIATOR VALVE – ONE PIPE STEAM RADIATOR

Measure Description

Thermostatic Radiator Valves (TRV) are self-contained, self-operated valves that do not require ancillary power. They provide local control of room temperature by controlling the venting of air out of the radiator. TRVs are available for a variety of installation conditions utilizing either remote-mounted sensors or integral-mounted sensors by means of remote or integral set point adjustment. This measure is specifically a TRV in combination with an air vent installed at one or more radiators in a one-pipe steam space heating system.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = N/A$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = units \times \Delta therms/HDD \times HDD_{avg}$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of TRV's installed
Δtherms/HDD	= Annual gas energy savings per Heating Degree Day (HDD), per TRV
HDDavg	= Average Heating Degree Days

Summary of Variables and Data Sources

Variable	Value	Notes
units		Number of TRV's installed, from application
ΔTherms/HDD	0.004318	Average gas savings per HDD per unit[204]
HDD_{avg}	4,871	Heating Degree Days for New York City (Central Park)[205]

[205] NYS Plumbing Code 2016 , Appendix D, Table D-101

Coincidence Factor (CF)
The recommended value for the coincidence factor is N/A.

Baseline Efficiencies from which Savings are Calculated
The baseline condition is an existing space heating system with manual control valves at freestanding radiators, convectors, or baseboard heating units.

Compliance Efficiency from which Incentives are Calculated
The measure is defined as the existing radiator, convector, or baseboard heater unit controlled by the thermostatic radiator valve.

Operating Hours
Evaluation of savings associated with installation of TRVs is dependent upon typical heating degree days as specified in the Summary of Variables and Data Sources above.

ENERGY MANAGEMENT SYSTEM (EMS)

Measure Description

An Energy Management System (EMS) is a computer system designed specifically for the automated control and monitoring of building systems which optimize the use of energy, as consumed by heating, ventilation, air conditioning, and domestic hot water heating. An EMS operates building functions as efficiently as possible while maintaining a specified level of comfort through the use of electromechanical control mechanisms. In multifamily buildings, an EMS installed with indoor temperature sensors in apartments and other heated spaces can reduce energy consumption by optimizing boiler operation based on seasonal weather variations, use patterns, and self-diagnostic functions. The measure is defined as the installation of a new EMS, consisting of a central boiler control system that allows for staging/control of multiple boilers and monitors indoor temperature, stack temperature, outdoor temperature, and supply or return water temperature.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

ΔkWh = N/A

Peak Coincident Demand Savings

ΔkW = N/A

Annual Gas Energy Savings

$$\Delta therms = \frac{BTUin}{100{,}000} \times EFLH_{heating} \times ESF$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
$BTUh_{in}$ = Furnace or boiler input rating
$EFLH_{heating}$ = Equivalent full-load hours
ESF = Energy Savings Factor for EMS
100,000 = Conversion factor, (BTUh/Therm)

Summary of Variables and Data Sources

Variable	Value	Notes
$BTUh_{in}$		From application, furnace or boiler input rating, in Btu/hr.
$EFLH_{heating}$		Lookup based on building type and location.
ESF	0.22	Energy Savings Factor, from US Energy Group study[206]

Coincidence Factor (CF)

N/A

Baseline Efficiencies from which Savings are Calculated

The baseline condition is an existing boiler control system based on outdoor temperature reset.

Compliance Efficiency from which Incentives are Calculated

The measure is defined as the new installation of a complete EMS with the capability of controlling an existing boiler system based on indoor and outdoor temperature.

Operating Hours

Heating equivalent full-load hours were calculated from a DOE-2.2 simulation of prototypical small commercial buildings. The EFLH values for commercial buildings are identified in Appendix G.

LIGHTING

LIGHT EMITTING DIODE (LED), COMPACT FLUORESCENT LAMP (CFL) AND OTHER LIGHTING

Measure Description

This section covers energy-efficient lighting equipment, such as energy-efficient lamps, compact fluorescent lamps, LED lamps, and improved lighting fixtures installed in interior or exterior locations. These technologies, taken separately or combined into an energy-efficient lighting fixture, provide the required illumination at reduced input power.

Beginning January 2014, the Energy Independence and Security Act of 2007 (EISA) regulations stipulated typical 60W and 40W lamp wattages to comply with 43W and 29W lamp wattage standards for rated lumen output ranges of 750-1049 and 310-749 lumens, respectively. Deemed baseline values for this measure will apply wattages based on lamp type and light output (lumens).[207]

Per EISA 2007, effective beginning January 1, 2020, if more stringent regulations are not put into effect by that date, the sale of general service lamps that do not meet a minimum efficiency standard of 45 lumens per watt will be prohibited.[208] As a result of this stipulation, deemed baseline wattages for non-exempt general service lighting will be reduced to reflect this requirement in the January 2020 NY TRM. This will have significant impact on claimable savings associated with replacement of general service lamps (20 – 70% depending on lumen output). This information is provided to inform future ETIP development.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times \frac{(W_{baseline} - W_{ee})}{1{,}000} \times hrs_{operating} \times (1 + HVAC_c)$$

Peak Coincident Demand Savings

$$\Delta kW = units \times \frac{(W_{baseline} - W_{ee})}{1{,}000} \times (1 + HVAC_d) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times \frac{(W_{baseline} - W_{ee})}{1{,}000} \times hrs_{operating} \times HVAC_g$$

[207] Energy Independence and Security Act of 2007. Pub. L. 110-140. Sec. 321. Efficient Light Bulbs H.R.6 – 86
[208] Energy Independence and Security Act of 2007. Pub. L. 110-140. Sec. 321. Efficient Light Bulbs H.R.6 – 89

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
W	= Rated wattage of lamp and/or fixture (Watts)
baseline	= Baseline condition or measure
ee	= Energy efficient condition or measure
1,000	= Conversion factor, one kW equals 1,000 Watts
CF	= Coincidence factor
$hrs_{operating}$	= Lighting operating hours
$HVAC_c$	= HVAC interaction factor for annual electric energy consumption
$HVAC_d$	= HVAC interaction factor for peak demand at NYISO coincident summer peak hour
$HVAC_g$	= HVAC interaction factor for annual natural gas consumption (therms/kWh)

Summary of Variables and Data Sources

Variable	Value	Notes
units		Number of lamps sold/distributed under the program, from application
W_{ee}		Energy efficient measure Watts, from application
$W_{baseline}$		Baseline measure Watts, from application or default values from applicable table in “Baseline Efficiencies…” section below
$hrs_{operating}$	1,168 - Interior Lamps 913 - Interior Fixtures 1,643 - Exterior	“Interior” designation extends to any covered area not adequately lit during daylight hours by sunlight, thus requiring daytime operation of lighting.
$HVAC_c$	0 for Exterior and Unconditioned Spaces	HVAC interaction factor for annual electric energy consumption (dimensionless). Vintage and HVAC type weighted average by city. See Appendix D.
$HVAC_d$	0 for Exterior and Unconditioned Space	HVAC interaction factor for peak demand at utility summer peak hour (dimensionless). Vintage and HVAC type weighted average by city. See Appendix D.
$HVAC_g$	0 for Exterior and Unconditioned Space	HVAC interaction factor for annual natural gas energy consumption (therms/kWh). Vintage and HVAC type weighted average by city. See Appendix D.
CF	0.082 – Interior 0.0 – Exterior	“Interior” designation extends to any covered area not adequately lit during daylight hours by sunlight, thus requiring daytime operation of lighting.

HVAC system interaction factors are defined as the ratios of the cooling energy and demand reduction and heating energy increase per unit of lighting energy reduction. Much of the input energy for lighting systems is converted to heat that must be removed by the HVAC system. Reductions in lighting heat gains due to lighting power reduction decrease the need for space cooling and increase the need for space heating.

HVAC interaction factors vary by climate, HVAC system type and building type. Recommended values for HVAC interaction factors for lighting energy and peak demand savings are shown in Appendix D. Lighting systems in unconditioned spaces or on the building exterior will have interaction factors of 0.0.

Coincidence Factor (CF)
The recommended value for the coincidence factor for interior lighting is 0.082. This factor was derived from an examination of studies throughout New England that calculated coincidence factors based on the definition of system peak period at the time, as specified by ISO-New England.[209]

Because exterior lighting is assumed to operate during off-peak hours only, the recommended coincidence factor for exterior lighting is 0.0.

Baseline Efficiencies from which Savings are Calculated
Rated wattage baseline values should reflect the guidance noted below based on bulb type and lumens in accordance with EISA standards. Note that deemed baseline wattages for non-exempt general service lighting will be reduced to reflect the EISA 2007 "Backstop Requirement" beginning with the January 2020 NY TRM, assuming more stringent requirements are not established.. This requirement, prohibiting the sale of general service lamps that do not meet a minimum efficiency standard of 45 lumens per watt will have significant impact on claimable savings associated with replacement of general service lamps (20 – 70% depending on lumen output). [210]

General Service Lamps
Baseline wattage for general service lamps are found in the table below. Per EISA 2007 guidelines, a general service lamp is defined as a standard incandescent or halogen type lamp that:

(1) Is intended for general service applications;
(2) Has a medium screw base;
(3) Has a lumen range of not less than 310 lumens and not more than 2,600 lumens
(4) Is capable of being operated at voltage range at least partially within 110 and 130 volts.

Certain lamp types are exempt from EISA compliance, including reflector lamps (see Reflector/Flood Lamps section below), decorative and globe shape lamps (see Specialty Lamps section below) and three-way lamps. Baseline wattage for any of these exempt lamp types should reflect the values in column (c) of the table below, with the exception of those lamps defined in the Specialty Lamps or Reflector/Flood Lamps sections below. All other general service lamps should use the baseline wattage values in column (b), corresponding to the applicable lumen range

[209] Coincidence Factor Study Residential and Commercial & Industrial Lighting Measures, Spring 2007, Table i-1
[210] Energy Independence and Security Act of 2007. Pub. L. 110-140. Sec. 321. Efficient Light Bulbs H.R.6 – 89

identified in column (a). For standard lamps that fall outside of the prescribed lumen ranges below, the manufacturer recommended baseline wattage should be used. For a complete list and definitions of EISA-exempt lamp types, reference Sec. 321: Efficient Light Bulbs of Public Law 110-140.[211]

Lumen Range (a)	Post-EISA 2007 Incandescent Equivalent $W_{baseline}$ (b)	EISA-Exempt Incandescent Equivalent $W_{baseline}$ (c)
310 – 449	25	25
450 – 799	29	40
800 – 1,099	43	60
1,100 – 1,599	53	75
1,600 – 1,999	72	100
2,000 – 2,600	72	150

Specialty Lamps[212]

Baseline wattage for specialty lamps are found in the table below. Specialty lamps are defined as medium screw-base lamps that are globe, bullet, candle or decorative shaped. For specialty lamps that fall outside of the prescribed lumen ranges below, the manufacturer recommended baseline wattage should be used.

Lumen Range (decorative) (a)	Lumen Range (globe) (b)	Post-EISA 2007 Incandescent Equivalent $W_{baseline}$ (c)	EISA-Exempt Incandescent Equivalent $W_{baseline}$ (d)
70 – 89		10	10
90 – 149		15	15
150 – 299	250 – 349	25	25
300 – 499	350 – 499	29	40
500 – 699	500 – 574	43	60
	575 – 649	53	75
	650 – 1,099	72	100
	1,100 – 1,300	72	150

Reflector/Flood Lamps[213]

Baseline wattage for reflector and flood type lamps are found in the table below. For reflector and flood lamps that fall outside of the prescribed lumen ranges below, the manufacturer recommended baseline wattage should be used.

[211] Energy Independence and Security Act of 2007. Pub. L. 110-140. Sec. 321. Efficient Light Bulbs H.R.6 – 82-86

[212] The Uniform Methods Project: Methods for Determining Energy Efficiency Savings for Specific Measures; Chapter 21: Residential Lighting Evaluation Protocol, National Renewable Energy Laboratory, December 2014, p. 8-11

[213] State of Pennsylvania Technical Reference Manual, PA Public Utilities Commission, June 2016, p. 21-22

Bulb Type (a)	Lumen Range (b)	$W_{baseline}$ (c)
ER30, BR30, BR40, or ER40	200 – 299	30
	300 – 449	40
	450 – 499	45
	500 – 1,419	65
R20	200 – 299	30
	300 – 449	40
	400 – 449	40
	450 – 719	45
All other R, PAR, ER, BR, BPAR, or similar bulb shapes, with diameter >2.25", other than those listed above	200 – 299	30
	300 – 599	40
	600 – 849	50
	850 – 999	55
	1000 – 1,300	65

Compliance Efficiency from which Incentives are Calculated
Compliance efficiency and fixture/lamp specifications shall be dictated by program eligibility criteria.

Operating Hours
Lamps
Hours of operation for lamps are estimated to be 3.2 operating hours per day or 1,168 (3.2 x 365) hours per year. The 3.2 operating hours per day is a value derived from an extended (nine month – May through February) logger study conducted during 2003 in Massachusetts, Rhode Island, and Vermont[214] . The Connecticut 2008 Program Savings Documentation uses 2.6 hours per day, based on a 2003 Connecticut-based study. A study of the 2005-2006 residential lighting program for Efficiency Maine reports daily hours of use at 4.8 hours from the markdown program component and 3.2 from the coupon program component[215]. This value represents a trade-off among factors that may affect the extent to which any out-of New York State value is applicable to NY. These include such factors as differences between the study area and NY, related to maturity of the CFL markets, program comparability, consumer knowledge of CFLs, and mix of locations within the house (which affects average hours of use). On balance, in considering the data and reports reviewed to date, 3.2 appears to be the most reasonable prior to New York-specific impact studies. This value is appropriate for interior applications only. For exterior applications, assume a total of 1,643 hours which is based on updated results from the 2003 Nexus Market

214 "Extended residential logging results" by Tom Ledyard, RLW Analytics Inc. and Lynn Heofgen, Nexus Market Research Inc., May 2, 2005, p.1

215 Process and Impact Evaluation of the Efficiency Maine Lighting Program, RLW Analytics, Inc, and Nexus Market Research Inc., April 10, 2007, Table 1-2, p. 12.

Research[216].

Fixtures

Hours of operation for fixtures are estimated to be 2.5 operating hours per day or 913 (2.5 x 365) hours per year. The 2.5 operating hours per day is a value derived from an extended (nine month – May through February) logger study conducted during 2003 in Massachusetts, Rhode Island and Vermont[217]. The Connecticut 2008 Program Savings Documentation uses 2.6 hours per day, based on a 2003 Connecticut-based study. A study of the 2005-2006 residential lighting program for Efficiency Maine reports daily hours of use at 2.4 for interior fixtures[218]. The proposed value represents a trade-off among factors that may affect the extent to which any value from outside of New York State is applicable to NY. These include such factors as differences between the study area and NY related to maturity of the CFL markets, program comparability, consumer knowledge of CFLs, and mix of locations within the house (which affects average hours of use). On balance, in considering the data and reports reviewed to date, 2.5 appears to be the most reasonable prior to New York specific impact studies.

Effective Useful Life (EUL)

See Appendix P.

Ancillary Fossil Fuel Savings Impacts

Reduction in lighting power increases space heating requirements in conditioned spaces. Interactive HVAC impacts are addressed in prescribed energy savings calculation methodology.

Ancillary Electric Savings Impacts

Reduction in lighting power decreases cooling requirements in conditioned spaces. Interactive HVAC impacts are addressed in prescribed energy savings calculation methodology.

AGRICULTURAL EQUIPMENT – CONTROL

ENGINE BLOCK HEATER TIMER

Measure Description

This section covers timers used to control engine block heaters on farm equipment engines such as tractors, skid steers, truck, generators, and so on. The timers are used to control existing engine block heaters.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times unit/application \times W_{heater}/1{,}000 \times hrs/day_{baseline} - hrs/day_{timer} \times days_{operating}$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δ therms	= Annual gas energy savings
units	= Number of measures installed under the program
timers/app	= Timers installed per application
1,000	= Conversion factor, one kW equals 1,000 watts
W	= Watts
heater	= Heater
$hr/day_{baseline}$	= Average hours per day heater plugged in
hr/day_{timer}	= Average hours per day timer turns the heater on
$days_{operating}$	= Days per year operating

Summary of Variables and Data Sources

Variable	Value	Notes
units	from application	
W_{heater}	from application	Wattage of engine block heater; is defined as the wattage of the engine block heater under control. This value is recorded by the customer on the application.
$hr/day_{baseline}$	from application	$hr/day_{baseline}$, is defined as the average number of hours the engine block heater is plugged in and was active before the installation of the timer. This value is recorded by the customer on the application.
hr/day_{timer}	2.0	Deemed value for timer operation hr/day_{timer} is defined as the

Variable	Value	Notes
		number of hours the engine block heater is controlled on by the timer. The on time and off time are set by the user. The number of hours required to sufficiently warm the engine depends on the size (mass) of the engine, the heating capacity of the heater and the environmental temperature. Estimates of 1 to 4 hours of block heater operation are common in the literature.
$days_{operating}$	from application	$days_{operating}$ is the number of days per year the engine block heater is operating. This value is calculated from the customer reported heater use start and end date on the application.

Coincidence Factor (CF)

The recommended value for the coincidence factor is

Baseline Efficiencies from which Savings are Calculated

The baseline condition is assumed to be the existing engine block heater plugged in and operational during the hours reported by the customer.

Compliance Efficiency from which Incentives are Calculated

The measure is defined as the existing block heater controlled by the timer. Timer on hours are set by the customer. A deemed value of 2.0 hours per day shall be used.

Operating Hours

Deemed value for timer operation is 2.0 hours per day

Effective Useful Life (EUL)

Years: 8
Source: Based on EUL's of similar control technology

APPLIANCE

CLOTHES DRYER

Measure Description

This measure covers residential grade clothes dryers meeting the criteria established under the ENERGY STAR® Program, Version 1.1, effective May 5, 2017 installed in small commercial settings.[219] ENERGY STAR® clothes dryers have a higher combined energy factor (CEF), and save energy through a combination of more efficient drying and reduced runtime of the drying cycle. More efficient drying is achieved through increased insulation, modifying operating conditions, improving air circulation, and improved efficiency of motors. Reduced dryer runtime is achieved through automatic termination of the dryer cycles based on temperature and moisture sensors. Clothes dryers originally qualified for the ENERGY STAR® label in May 2014. Clothes dryers that have earned this label are approximately 20% more efficient than non-qualified models.[220]

The algorithms, inputs, and savings presented below assume a normal replacement scenario.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times Cycles_{annual} \times Load \times \left[\frac{F_{elec,baseline}}{CEF_{baseline}} - \frac{F_{elec,ee}}{CEF_{ee}}\right]$$

Peak Coincident Demand Savings

$$\Delta kW = \frac{\Delta kWh}{hrs} \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times Cycles_{annual} \times Load \times \left[\frac{F_{gas,baseline}}{CEF_{baseline}} - \frac{\times F_{gas,ee}}{CEF_{ee}}\right] \times \frac{3{,}412}{100{,}000}$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
$Cycles_{annual}$	= Number of dryer cycles per year
Load	= Average total weight (lbs) of clothes per drying cycle
$_{baseline}$	= Baseline condition or measure

[219] ENERGY STAR® Program Requirements Product Specification for Clothes Dryers, Eligibility Criteria Version 1.1, May 2017

[220] Efficiency of ENERGY STAR® products: https://www.energystar.gov/products/appliances/clothes_dryers

ee = Energy efficient condition or measure
F_{elec} = Percentage of energy consumed that is derived from electricity
F_{gas} = Percentage of energy consumed that is derived from gas
CEF = Combined energy factor (lb/kWh)
hrs = Annual run hours of clothes dryer
CF = Coincidence Factor
3,412 = Conversion factor, one kWh equals 3,412 BTU
100,000 = Conversion factor (BTU/therm), one therm equals 100,000 BTU

hrs	290	290	290	290	290

Coincidence Factor (CF)
The recommended value for the coincidence factor is 0.042.[230]

Baseline Efficiencies from which Savings are Calculated
The baseline condition is a standard efficiency, residential grade clothes dryer with operating specifications as defined in the Key Variables Lookup Table above.

Compliance Efficiency from which Incentives are Calculated
The compliance condition is a residential grade clothes dryer appearing on the ENERGY STAR® qualified products list.

Operating Hours
Operating hours for residential clothes dryers are provided in the Key Variables Lookup Table above. In the absence of justifiable default operating characteristics for residential grade clothes dryers installed in small commercial facilities, residential values are assumed.

Effective Useful Life (EUL)
See Appendix P.

Ancillary Fossil Fuel Savings Impacts

A clothes dryer releases heat to the surrounding environment. Conventional vented dryers also vent air outside the building. The associated HVAC impact of dryers depends upon a number of

[230] Based on Central Maine Power Company "Residential End-Use Metering Project", 1988. Using 8,760 data for electric clothes dryers, calculating the CF according to the PJM peak definition. This study is not publicly available, but is referenced by the Pennsylvania Technical Reference Manual, State of Pennsylvania, 2016. http://www.puc.state.pa.us/filing_resources/issues_laws_regulations/act_129_information/technical_reference_manual.aspx

variables including climate and placement of a dryer (i.e., in a conditioned or unconditioned space). It is an area of ongoing research.[231] These impacts are excluded from the methodology prescribed herein until they can be quantified and substantiated through independent research.

COMBINATION OVENS

Measure Description

This measure covers the installation of ENERGY STAR® qualified gas or electric commercial combination ovens.[232] Though not eligible for ENERGY STAR® qualifications, electric combination ovens with capacities of 21 pans or greater aligning with Food Service Technology Center (FSTC) assumptions for energy efficient products per the compliance efficiencies section below are also included in the measure.[233] A combination oven combines the function of hot air convection, saturated and superheating steam heating, and combination convection/steam mode for moist heating. The oven is used for steaming, baking, roasting, re-thermalizing, and proofing of various food products. High efficiency boiler-less combination ovens use nearly half as much water as typical boiler-based combination ovens.[234]

A combination oven can also be referred to as a combi, combo, or combination oven/steamer. Combination ovens come in a range of sizes based on their capacity to accommodate 12 x 20 x 2 1/2 inch hotel pans. This measure includes half size and full size combination ovens. Measure calculations are based on oven pan capacity of full size, 2 1/2 inch hotel pans.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings (Electric Equipment Only)

$$\Delta kWh = units \times days \times \frac{(\Delta BTU_{preheat} + \Delta BTU_{idle,c} + \Delta BTU_{idle,s} + \Delta BTU_{cooking,c} + \Delta BTU_{cooking,s})}{3{,}412}$$

Peak Coincident Demand Savings (Electric Equipment Only)

$$\Delta kW = \frac{\Delta kWh}{(days \times hrs)} \times CF$$

Annual Gas Energy Savings (Gas Equipment Only)

$$\Delta therms = units \times days \times \frac{(\Delta BTU_{preheat} + \Delta BTU_{idle,c} + \Delta BTU_{idle,s} + \Delta BTU_{cooking,c} + \Delta BTU_{cooking,s})}{100{,}000}$$

[232] ENERGY STAR® Program Requirements Product Specification for Commercial Ovens, Eligibility Criteria Version 2.2, March 2015

[233] Food Service Technology Center, Qualified Combination Ovens, February 2018

[234] Food Service Technology Center, Combination Ovens, Save Water (accessed 3/15/2018)

where:

$$\Delta BTU_{preheat} = N_{preheat} \times (BTU_{preheat,baseline} - BTU_{preheat,ee})$$

$$\Delta BTU_{idle,c} = \begin{bmatrix} BTUh_{idle,c,baseline} \times \left(hrs - N_{preheat} \times hrs_{preheat} - \frac{lbs}{(lbs/hr)_{c,baseline}}\right) \\ -BTUh_{idle,c,ee} \times \left[hrs - N_{preheat} \times hrs_{preheat} - \frac{lbs}{(lbs/hr)_{c,ee}}\right] \end{bmatrix} \times (1 - F_s)$$

$$\Delta BTU_{idle,s} = \begin{bmatrix} BTUh_{idle,s,baseline} \times \left(hrs - N_{preheat} \times hrs_{preheat} - \frac{lbs}{(lbs/hr)_{s,baseline}}\right) \\ -BTUh_{idle,s,ee} \times \left[hrs - N_{preheat} \times hrs_{preheat} - \frac{lbs}{(lbs/hr)_{s,ee}}\right] \end{bmatrix} \times F_s$$

$$\Delta BTU_{cooking,c} = lbs \times Q_{food,c} \times \left(\frac{1}{Eff_{c,baseline}} - \frac{1}{Eff_{c,ee}}\right) \times (1 - F_s)$$

$$\Delta BTU_{cooking,s} = lbs \times Q_{food,s} \times \left(\frac{1}{Eff_{s,baseline}} - \frac{1}{Eff_{s,ee}}\right) \times F_s$$

NOTE: $\Delta BTU_{preheat}$, ΔBTU_{idle} and $\Delta BTU_{cooking}$ terms can be calculated per the equations above using any combination of actual qualifying equipment specifications and assumed values as defined in the Baseline Efficiencies, Compliance Efficiency and Operating Hours sections below, or looked up from the Default Values table below.

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
$\Delta BTU_{preheat}$ = Daily preheat energy savings
ΔBTU_{idle} = Daily idle energy savings
$\Delta BTU_{cooking}$ = Daily cooking energy savings
units = Number of measures installed under the program
days = Operating days per year
hrs = Daily operating hours
$_{baseline}$ = Baseline condition or measure
$_{ee}$ = Energy efficient condition or measure
$_{c}$ = Convection mode
$_{s}$ = Steam mode
$BTU_{preheat}$ = Equipment preheat energy (BTU)
$N_{preheat}$ = Number of preheats per day
$hrs_{preheat}$ = Preheat duration (hours)
$BTUh_{idle}$ = Equipment idle energy rate (BTU/h)
(lbs/hr) = Equipment production capacity (lbs/hr)
lbs = Total daily food production
Q_{food} = Heat to food (BTU/lb)
Eff = Equipment convection/steam mode cooking efficiency

F_s = Steam mode time factor
CF = Coincidence factor
3,412 = Conversion factor, one kW equals 3,412.14 BTU/h

Summary of Variables and Data Sources

Combi Gas Oven, > 30 Pans[246]	8,000	788 x hrs -1,030	14,395 x hrs - 18,555	6,868	2,627

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.9.[247]

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a combination oven as defined in the Measure Description section above with operating characteristics per the table below. Values are as reported from referenced ENERGY STAR® Commercial Food Service Calculator[248] unless otherwise noted. Preheat energy rates and all values for electric combi-ovens with capacities greater than 21 pans are reported from referenced FSTC calculators.

Equipment	$BTU_{preheat,baseline}$ (BTU)	$BTUh_{idle,c,baseline}$ (BTU/h)	$BTUh_{idle,s,baseline}$ (BTU/h)	(lbs/hr)$_{c,baseline}$	(lbs/hr)$_{s,baseline}$	$Eff_{c,baseline}$ (%)	$Eff_{s,baseline}$ (%)
Combi Electric Oven, < 15 Pans	10,236[249]	4,504	17,947	79	126	72%	49%
Combi Electric Oven, 15 - 20 Pans	12,795[250]	7,779	29,719	166	295	72%	49%
Combi Electric Oven, 21 - 28 Pans[251]	12,795	12,795	42,650	100	150	65%	40%

Ancillary Fossil Fuel Savings Impacts
More efficient food service equipment rejects less heat into the condition space than standard equipment, increasing space heating requirements while decreasing cooling load. However, no relevant studies have been performed to date that would allow quantification of these impacts. Until additional information is available, these impacts are excluded from the prescribed formulation of savings.

Ancillary Electric Savings Impacts
More efficient food service equipment rejects less heat into the condition space than standard equipment, increasing space heating requirements while decreasing cooling load. However, no relevant studies have been performed to date that would allow quantification of these impacts. Until additional information is available, these impacts are excluded from the prescribed formulation of savings.

INSULATED HOLDING CABINETS

Measure Description

This measure covers the installation of ENERGY STAR® qualified electric commercial hot food holding cabinets.[267] A food holding cabinet is a fully enclosed compartment designed to maintain the temperature of hot food that has been cooked in a separate appliance. Half-size, full-size and large-size holding cabinets are included in this measure. Half-size holding cabinets are defined as any holding cabinet with an internal measured volume of less than 15ft^3. Full-size holding cabinets are defined as any holding cabinet with an internal measured volume of greater than or equal to 15ft^3 and less than or equal to 28ft^3. Large-size holding cabinets are defined as any holding cabinet with an internal measure volume of greater than 28ft^3. This measure does not include cook-and-hold or re-therm equipment.[268]

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times hrs \times days \times \frac{\Delta W_{idle}}{1{,}000}$$

Peak Coincident Demand Savings

$$\Delta kW = \frac{\Delta kWh}{(hrs \times days)} \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

$$\Delta W_{idle} = W_{idle,baseline} - W_{idle,ee}$$

NOTE: ΔW_{idle} term can be calculated per the equation above using actual qualifying equipment specifications or looked up from the Default Values table below.

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
ΔW_{idle}	= Daily idle energy savings
units	= Number of measures installed under the program
hrs	= Daily operating hours
days	= Operating days per year

[267] ENERGY STAR® Program Requirements for Commercial Hot Food Holding Cabinets, Eligibility Criteria Version 2.0, July 2011

[268] PG&E Work Paper PGECOFST105 Revision 5, pg. 1

v = Volume of holding cabinet (ft^3)
baseline = Baseline condition or measure
ee = Energy efficient condition or measure
W_{idle} = Equipment idle energy rate by volume (W)
CF = Coincidence factor
1,000 = Conversion factor, one kW equals 1,000 watts

Summary of Variables and Data Sources

Variable	Value	Notes
ΔW_{idle}		Calculate based on calculations above or look up in Default Values table below.
days		From application or look up based on facility type in Operating Hours section below.
hrs		From application or look up based on facility type in Operating Hours section below.
v	Large-Size: 35 Full-Size: 25 Half-Size: 10	From application or use default values provided.[269]
$W_{idle,baseline}$	40v	Equipment idle energy rate by volume (W).[270]
$W_{idle,ee}$	Large-Size: 3.8v + 203.5 Full-Size: 2v + 254 Half-Size: 21.5v	From application or use default value provided.[271]
CF	0.9	

Default Values

The table below contains ΔW_{idle} values that may be used in the formulation of estimated savings in lieu of utilizing the calculation prescribed above for this term. These values were established by performing that calculation using default values from the Summary of Variables and Data Sources above.

Equipment	ΔW_{idle}
Insulated Holding Cabinet, Large-Size	1,064
Insulated Holding Cabinet, Full-Size	696
Insulated Holding Cabinet, Half-Size	185

[269] PG&E Work Paper PGECOFST105 Revision 5, Table 6, pg. 5
[270] ENERGY STAR® Program Requirements for Commercial Hot Food Holding Cabinets, Eligibility Criteria Version 2.0, July 2011, where v is holding cabinet volume (ft^3)
[271] Ibid, where v is holding cabinet volume (ft^3)

Coincidence Factor (CF)
The recommended value for the coincidence factor is 0.9.[272]

Baseline Efficiencies from which Savings are Calculated
The baseline condition is an insulated holding cabinet as defined in the Measure Description above with operating characteristics per the Summary of Variables and Data Sources table above.

Compliance Efficiency from which Incentives are Calculated
The compliance condition is ENERGY STAR® food service equipment as defined in the Measure Description section above. Operating characteristics shall be taken from application. When unavailable, default characteristics shall be taken from the Summary of Variables and Data Sources table above.

Operating Hours
Equipment operating hours per day and days per year shall be taken from the application if known. Default operating hours per day and days per year are provided below, established based on a weighted average of values associated with similar facility types, as reported by the California Energy Commission.[273]

Facility Type	hours/day	days/year
Community College	11	283
Fast Food Restaurant	14	363
Full Service Restaurant	12	321
Grocery	12	365
Hospital	11	365
Hotel	20	365
Miscellaneous	9	325
Motel	20	365
Primary School	5	180
Secondary School	8	180
Office	12	250
University	11	283

Effective Useful Life (EUL)
See Appendix P.

Ancillary Fossil Fuel Savings Impacts
More efficient food service equipment rejects less heat into the conditioned space than standard equipment, increasing space heating requirements while decreasing cooling load. However, no relevant studies have been found to date that would allow quantification of these impacts. Until additional information is available, these impacts are excluded from the prescribed formulation of savings.

OVENS, STEAMERS, FRYERS AND GRIDDLES

Measure Description

This measure covers the installation of ENERGY STAR® qualified commercial kitchen equipment that meet the descriptions below. Unless otherwise noted, presented baseline, compliance, and default values are determined from ENERGY STAR® Commercial Food Service Equipment Calculator.[274]

- Convection Ovens[275] - This measure includes gas and electric commercial convection ovens. A convection oven forces hot dry air over the surface of a food product. A full size convection oven can accommodate standard full size sheet pans measuring 18 x 26 x 1 inch. A half size convection oven can accommodate half size sheet pans measuring 18 x 13 x 1 inch. Though not eligible for ENERGY STAR® qualification, this measure includes half size gas convection ovens. Half size gas convection ovens must have an idle rate of 8,000 BTUh or less, per assumed efficiency of qualified equipment by the Food Service Technology Center (FSTC).[276]
- Rack Ovens[277] - This measure includes gas commercial rack ovens. A rack oven is a high capacity oven in which a rack is wheeled into the oven and can be rotated during the baking process. Rack ovens range in capacity from mini rack ovens to quadruple rack ovens. Single and double rack ovens are included in this measure.
- Steamers[278] - This measure includes gas and electric commercial steamers, also known as compartment steamers. A steamer is a device that contains one or more food steaming compartments in which the energy in the steam is transferred to the food by direct contact. To calculate the savings for this measure, the number of pans must be known. Countertop, wall-mounted, and floor models mounted on a stand, pedestal, or cabinet-style base are included. Commercial steamer microwave ovens are not included in this measure.
- Fryers[279] - This measure includes gas and electric commercial deep-fat fryers. A deep-fat fryer is an appliance in which oils are placed to such a depth that the cooking food is essentially supported by displacement of the cooking fluid rather than by the bottom of the vessel. Depending on the fryer type, heat is delivered to the cooking fluid by means of an immersed electric element or band-wrapped vessel (electric fryers), or by heat transfer from gas burners through either the walls of the fryer or through tubes passing through the cooking fluid (gas fryers). Standard fryers and large vat fryers are included in this measure.
- Griddles[280] - This measure includes single-sided gas and electric commercial griddles. A single-sided commercial griddle is a commercial appliance designed for cooking food in oil or its own juices by direct contact with either a flat, smooth, hot surface or a hot

---

[276] Food Service Technology Center, Qualified Convection Ovens, February 2018
[277] ENERGY STAR® Program Requirements Product Specification for Commercial Ovens, Eligibility Criteria, Version 2.2., March 2015
[278] ENREGY STAR® Program Requirements for Commercial Steam Cookers, Eligibility Criteria Version 1.2, August 2003
[279] ENERGY STAR® Program Requirements Product Specification for Commercial Fryers, Eligibility Criteria Final Draft Version 3.0. October 2016
[280] ENERGY STAR® Program Requirements for Commercial Griddles, Eligibility Criteria Version 1.2, January 2011

channeled cooking surface where plate temperature is thermostatically controlled. To calculate the energy savings in this measure, the griddle dimensions must be known. This measure does not include double-sided gas or electric commercial griddles.

- Gas Conveyor Ovens - Though not eligible for ENERGY STAR® qualification, this measure additionally covers the installation of energy efficient gas conveyor ovens. Conveyor ovens cook food by carrying it on a moving belt through a heated chamber. Qualifying conveyor ovens have baking efficiencies greater than or equal to 42% and idle energy rates less than or equal to 57,000 BTUh, per assumed efficiency of qualified equipment by the Food Service Technology Center (FSTC).[281]

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings (Electric Equipment Only)

$$\Delta kWh = units \times days \times \frac{\left(\Delta BTU_{preheat} + \Delta BTU_{idle} + \Delta BTU_{cooking}\right)}{3{,}412}$$

Peak Coincident Demand Savings (Electric Equipment Only)

$$\Delta kW = \frac{\Delta kWh}{(days \times hrs)} \times CF$$

Annual Gas Energy Savings (Gas Equipment Only)

$$\Delta therms = units \times days \times \frac{\left(\Delta BTU_{preheat} + \Delta BTU_{idle} + \Delta BTU_{cooking}\right)}{100{,}000}$$

where:

$$\Delta BTU_{preheat} = N_{preheat} \times \left(BTU_{preheat,baseline} - BTU_{preheat,ee}\right)$$

$$\Delta BTU_{idle} = BTUh_{idle,baseline} \times \left[hrs - N_{preheat} \times hrs_{preheat} - \left(\frac{lbs}{(lbs/hr)_{baseline}}\right)\right] - BTUh_{idle,ee} \times \left[hrs - N_{preheat} \times hrs_{preheat} - \left(\frac{lbs}{(lbs/hr)_{ee}}\right)\right]$$

$$\Delta BTU_{cooking} = lbs \times Q_{food} \times \left(\frac{1}{Eff_{baseline}} - \frac{1}{Eff_{ee}}\right)$$

NOTE: $\Delta BTU_{preheat}$, ΔBTU_{idle} and $\Delta BTU_{cooking}$ terms can be calculated per the equations above using either actual qualifying equipment specs or default values as defined in the Common Variables, Baseline Efficiencies, Compliance Efficiency and Operating Hours sections below, or looked up from the Default Values table below.

[281] Food Service Technology Center, Qualified Conveyor Ovens, February 2018

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
$\Delta therms$	= Annual gas energy savings
$\Delta BTU_{preheat}$	= Daily preheat energy savings
ΔBTU_{idle}	= Daily idle energy savings
$\Delta BTU_{cooking}$	= Daily cooking energy savings
units	= Number of measures installed under the program
days	= Operating days per year
hrs	= Daily operating hours
$_{baseline}$	= Baseline condition or measure
$_{ee}$	= Energy efficient condition or measure
$BTU_{preheat}$	= Equipment preheat energy (BTU)
$N_{preheat}$	= Number of preheats per day
$hrs_{preheat}$	= Preheat duration (hours)
$BTUh_{idle}$	= Equipment idle energy rate (BTU/h)
(lbs/hr)	= Equipment production capacity (lbs/hr)
lbs	= Total daily food production
Q_{food}	= Heat to food (BTU/lb)
Eff	= Equipment convection/steam mode cooking efficiency
CF	= Coincidence factor
3,412	= Conversion factor, one kW equals 3,412.14 BTU/h

Summary of Variables and Data Sources

Variable	Value	Notes
$\Delta BTU_{preheat}$		Calculate based on calculations above or look up in Default Values table below.
ΔBTU_{idle}		Calculate based on calculations above or look up in Default Values table below.
$\Delta BTU_{cooking}$		Calculate based on calculations above or look up in Default Values table below.
days		From application or look up based on facility type in Operating Hours section below.
hrs		From application or look up based on facility type in Operating Hours section below.
$N_{preheat}$	1[282]	
$BTU_{preheat,baseline}$		Look up based on qualifying equipment type in Baseline Efficiencies section below.
$BTU_{preheat,ee}$		From application or look up based on qualifying equipment type in Compliance Efficiency section below.
$BTUh_{idle,baseline}$		Look up based on qualifying equipment type in Baseline Efficiencies section below.

282 Shared assumption from all PG&E Work Papers referenced in this measure

Variable	Value	Notes
$BTUh_{idle,ee}$		From application or look up based on qualifying equipment type in Compliance Efficiency section below.

$Eff_{baseline}$		Look up based on qualifying equipment type in Baseline Efficiencies section below.
Eff_{ee}		From application or look up based on qualifying equipment type in Compliance Efficiency section below.
CF	0.9	

Default Values

The table below contains values and simplified calculations for $\Delta BTU_{preheat}$, ΔBTU_{idle} and $\Delta BTU_{cooking}$ terms that may be used in the formulation of estimated savings in lieu of utilizing the calculations prescribed above for these terms. These values were established by performing those calculations using assumed values from the Common Variables, Baseline Efficiencies and Compliance Efficiency sections below.

Equipment	$\Delta BTU_{preheat}$	ΔBTU_{idle}	$\Delta BTU_{cooking}$
Convection Oven, Electric, Full Size	1,706	1,365 x hrs - 1,858	3,250
Convection Oven, Electric, Half Size	341	102 x hrs - 1,011	1,553
Convection Oven, Gas, Full Size	8,000	3,100 x hrs - 5,014	2,470
Convection Oven, Gas, Half Size	5,500	3,500 x hrs - 12,087	27,778
Conveyor Oven, Gas	17,000	13,000 x hrs - 55,144	124,405
Rack Oven, Gas, Double Rack	15,000	35,000 x hrs – 179,550	397,692
Rack Oven, Gas, Single Rack	6,000	18,000 x hrs - 89,017	176,250
Steamer, Electric[283]	0	14,581 x hrs – 11,229	19,385
Steamer, Gas[284]	11,000	27,378 x hrs – 24,643	42,368
Fryer, Electric, Standard	2,047	1,365 x hrs - 3,941	10,988
Fryer, Electric, Large Vat	1,194	853 x hrs - 2,005	15,268
Fryer, Gas, Standard	4,500	5,000 x hrs - 15,481	73,286
Fryer, Gas, Large Vat	5,000	4,000 x hrs - 8,636	73,286
Griddle, Electric[285]	6,834	1,638 x hrs - 7,451	5,220

[283] Assumes 6 pans
[284] Assumes 6 pans
[285] Assumes 3-foot griddle width, 2-foot griddle depth

Equipment	$\Delta BTU_{preheat}$	ΔBTU_{idle}	$\Delta BTU_{cooking}$
Griddle, Gas[286]	6,000	5,100 x hrs - 49,875	23,438

Common Variables[287]

Equipment	Value		
	$hrs_{preheat}$	lbs	Q_{food} (BTU/lb)
Convection Oven, Electric, Full Size	0.25[288]	100	250
Convection Oven, Electric, Half Size	0.25[289]	100	250
Convection Oven, Gas, Full Size	0.25[290]	100	250
Convection Oven, Gas, Half Size	0.25[291]	100	250
Conveyor Oven, Gas	0.25[292]	190	250
Rack Oven, Gas, Double Rack	0.33[293]	1,200[294]	235
Rack Oven, Gas, Single Rack	0.33[295]	600	235
Steamer, Electric	0.25[296]	100	105
Steamer, Gas	0.25[297]	100	105
Fryer, Electric, Standard	0.25[298]	150	570
Fryer, Electric, Large Vat	0.25[299]	150	570
Fryer, Gas, Standard	0.25[300]	150	570
Fryer, Gas, Large Vat	0.25[301]	150	570
Griddle, Electric	0.25[302]	100	475
Griddle, Gas	0.25[303]	100	475

Coincidence Factor (CF)
The recommended value for the coincidence factor is 0.9.[304]

Baseline Efficiencies from which Savings are Calculated
The baseline condition is food service equipment as defined in the Measure Description above with operating characteristics per the table below. Values are as reported from referenced

The compliance condition is ENERGY STAR® food service equipment or, in the case of conveyor ovens and half size gas convection ovens, equipment aligning with FSTC assumptions for energy efficient products meeting the minimum performance specifications listed in the table below. Operating characteristics shall be taken from application. When unavailable, default characteristics shall be taken from the table below. Values are as reported from the ENERGY STAR® Commercial Food Service Equipment Calculator, unless otherwise noted.[323] Preheat energy and all values for half size gas convection ovens and conveyor ovens are reported from referenced FSTC sources.

Equipment	$BTU_{preheat,ee}$ (BTU)	$BTUh_{idle,ee}$ (BTU/h)	$(lbs/hr)_{ee}$	Eff_{ee} (%)
Convection Oven, Electric, Full Size	3,412[324]	5,459	90	71%

Miscellaneous	9	325
Motel	20	365
Primary School	5	180
Secondary School	8	180
Office	12	250
University	11	283

Effective Useful Life (EUL)

See Appendix P.

Ancillary Fossil Fuel Savings Impacts

More efficient food service equipment rejects less heat into the condition space than standard equipment, increasing space heating requirements while decreasing cooling load. However, no relevant studies have been performed to date that would allow quantification of these impacts. Until additional information is available, these impacts are excluded from the prescribed formulation of savings.

Ancillary Electric Savings Impacts

More efficient food service equipment rejects less heat into the condition space than standard equipment, increasing space heating requirements while decreasing cooling load. However, no relevant studies have been performed to date that would allow quantification of these impacts.

REFRIGERATOR REPLACEMENT

Measure Description

Energy Star rated (or qualified) commercial, reach-in refrigerators used in commercial foodservice applications, with an integral compressor and condenser.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times (kWh_{baseline} - kWh_{ee}) \times (1 + HVAC_c) \times F_{occ} \times F_{market}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times \left[\frac{kWh_{baseline}}{8{,}760} - \frac{kWh_{ee}}{8{,}760}\right] \times CF \times (1 + HVAC_d) \times F_{market}$$

Annual Gas Energy Savings

$$\Delta therms = \Delta kWh \times HVAC_g$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
F_{occ}	= Occupant factor
F_{market}	= Market factor
CF	= Coincidence factor
baseline	= Baseline condition or measure
consumption	= Consumption
d	= Demand
g	= Gas
8,760	= Hours in one year
$HVAC_c$	= HVAC interaction factor for annual electric energy consumption
$HVAC_d$	= HVAC interaction factor at utility summer peak hour
$HVAC_g$	= HVAC interaction factor for annual natural gas consumption

Summary of Variables and Data Sources

Variable	Value	Notes
v		Volume from application
$kWh_{baseline}$		Annual energy consumption for the baseline appliance, calculated from volume and type using equations above
kWh_{ee}		Annual energy consumption for the energy efficient appliance, calculated from volume and type using equations above
$HVAC_c$		HVAC interaction factor for annual electric energy consumption, lookup by building type with weighted average across HVAC types. Average upstate values or

Variable	Value	Notes
		NYC.
$HVAC_d$		HVAC interaction factor at utility summer peak hour, lookup by building type with weighted average across HVAC types. Average upstate values or NYC.
$HVAC_g$		HVAC interaction factor for annual natural gas consumption, lookup by building type with weighted average across HVAC types. Average upstate values or NYC.

Coincidence Factor (CF)
The recommended value for the coincidence factor is 1.0

The ***HVAC system interaction factor*** is defined as the ratio of the cooling energy reduction per unit of lighting energy reduction. Most of the input energy for standalone refrigeration systems is converted to heat which must be removed by the HVAC system. Reductions in refrigerator heat gains due to efficient refrigerators decrease the need for space cooling and increase the need for space heating. HVAC interaction factors vary by climate, HVAC system type and building type. Recommended values for HVAC interaction factors for refrigerator energy and peak demand savings are shown in Appendix D.

Baseline Efficiencies from which Savings are Calculated
The Foodservice Technology Center has estimated the energy consumption of baseline commercial refrigerators based on data compiled by the California Energy Commission. Baseline daily kWh for solid door and glass door commercial reach-in refrigerators are calculated as shown in the Table below. Multiply by 365 to get annual kWh.

Type	Refrigerator	Freezer
Solid Door	0.10 V + 2.04	0.40 V + 1.38
Glass Door	0.12 V + 3.34	0.75 V + 4.10

V= AHAM volume

Compliance Efficiency from which Incentives are Calculated
Commercial refrigerator and freezer energy consumption. Energy Star rated refrigerators must meet the specifications in the table below for maximum daily energy consumption (kWh/day). Multiply by 365 to get annual energy consumption.

Table 1: Maximum Daily Energy Consumption (MDEC) Requirements (kWh/day) for ENERGY STAR Qualified Commercial Food-grade Refrigerators and Freezers		
Product Volume (in cubic feet)	**Refrigerator**	**Freezer**
Vertical Configuration		
Solid Door Cabinets		
0 < V < 15	≤ 0.089V + 1.411	≤ 0.250V + 1.250
15 ≤ V < 30	≤ 0.037V + 2.200	≤ 0.400V – 1.000
30 ≤ V < 50	≤ 0.056V + 1.635	≤ 0.163V + 6.125
50 ≤ V	≤ 0.060V + 1.416	≤ 0.158V + 6.333
Glass Door Cabinets		
0 < V < 15	≤ 0.118V + 1.382	≤ 0.607V + 0.893
15 ≤ V < 30	≤ 0.140V + 1.050	≤ 0.733V – 1.000
30 ≤ V < 50	≤ 0.088V + 2.625	≤ 0.250V + 13.500
50 ≤ V	≤ 0.110V + 1.500	≤ 0.450V + 3.500
Chest Configuration		
Solid or Glass Door Cabinets	≤ 0.125V + 0.475	≤ 0.270V + 0.130

Note: V = AHAM volume, as defined in Section 1, in cubic feet (ft^3).

Operating Hours

The measure is assumed to operate 24hrs/7days per week, (8,760 hours annual operating hours)

Effective Useful Life (EUL)

Years: 12

Source: DEER

Ancillary Fossil Fuel Savings Impacts

Efficient refrigerators reject less heat into the conditioned space, which must be made up by the space heating system. Calculations must include space heating interactions with efficient refrigerators.

Ancillary Electric Savings Impacts

APPLIANCE – CONTROL

TIER 1 ADVANCED POWER STRIP

Measure Description

This measure covers the installation of Tier 1 Advanced Power Strips (APS) in office workstations. The Tier 1 APS makes use of a control outlet to disconnect the controlled plugs when the load on the control outlet (usually a computer) is reduced below a threshold. In this case, the reduction below threshold of the control plug happens when the computer shuts down or enters standby mode. Therefore, the overall load of a centralized group of equipment (e.g. monitors and other peripherals for the computer) can be reduced.

Method for Calculating Annual Energy and Peak Coincident Demand Savings[342]

Annual Electric Energy Savings

$$\Delta kWh = units \times \begin{bmatrix} \Delta kW_{wkday} \times \left(hrs_{wkday} - hrs_{wkday-open}\right) \\ + \\ \Delta kW_{wkend} \times \left(hrs_{wkend} - hrs_{wkend-open}\right) \end{bmatrix} \times \frac{8{,}760}{168}$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
ΔkW_{wkday}	= Average power reduction during weekday off hours
ΔkW_{wkend}	= Average power reduction during weekend off hours
hrs_{wkday}	= Total hours during the work week (Monday 7:30 AM to Friday 5:30 PM)
hrs_{wkend}	= Total hours during the weekend (Friday 5:30 PM to Monday 7:30 AM)
$hrs_{wkday,open}$	= Hours the office is open during the work week
$hrs_{wkend,open}$	= Hours the office is open during the weekend
8,760	= Hours in one year
168	= Hours in one week

[342] Savings algorithm reconstructed from weekday and weekend savings information in Sheppy *et. al*, and verified against savings in Acker *et. al* and savings in: BPA, "Smart Power Strip Energy Savings Evaluation: Ross Complex," (2011). Office stations are assumed to have zero or minimal standby losses during normal operating hours.

Summary of Variables and Data Sources

Variable	Value	Notes
ΔkW_{wkday}	0.0315	Deemed value from IDL and NREL/NAVFAC study, determined by reduction in off-hours demand. See Deemed Savings Background section below for additional detail.
ΔkW_{wkend}	0.0067	Deemed value from IDL and NREL/NAVFAC study, determined by reduction in off-hours demand. See Deemed Savings Background section below for additional detail.
hrs_{wkday}	106	
$hrs_{wkday,open}$		From application. If unknown, use 50 hours.[343]
hrs_{wkend}	62	
$hrs_{wkend,open}$		From application. If unknown, use 0 hours.[344]

Deemed Savings Background

Since the introduction of the Tier 1 APS for commercial applications, three studies of its performance in commercial office settings have been conducted. Their ex-post estimates for savings are in relative agreement, between 134 and 149 kWh. The three studies are:

1. A University of Idaho Integrated Design Lab (IDL) project studying 49 load-sensing power strips in a large, private office building. Baseline data was gathered for one year and post-period data was gathered for 3 months. The study broke out findings into weekday, weekend, and holiday categories.[345]
2. A National Renewable Energy Laboratory (NREL) and Naval Facilities Engineering Command (NAVFAC) joint APS evaluation, with 100 load-sensing power strips. Whole building load shapes were monitored pre and post. This study had five weeks of baseline data and six weeks of treatment data.[346]
3. A Bonneville Power Administration APS evaluation at the Ross Complex, in which 48 strips were installed for a pre- and post-treatment period of three weeks each. Data for this study was measured at the individual power strip level.[347]

The calculation for energy savings uses the detailed breakdowns of energy savings from the IDL study and the assumption that savings only occur outside of normal business hours. The value of 31.5 watts reduced during off-hours on weekdays was calculated with data from the IDL study and aligns with the graphically shown load reduction in the NREL/NAVFAC study. The same method was performed for the weekends to obtain the wattage reduced. The number from the IDL study of 6.7 watts reduced on weekends is more conservative than the NREL/NAVFAC results and is used for this calculation.

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A. The majority of kWh savings are assumed to occur during off-hours, so no peak coincident demand savings are deemed.

---

[343] Assumes an office operating schedule of M - F, 7:30AM – 5:30PM
[344] Assumes an office operating schedule of M - F, 7:30AM – 5:30PM
[345] Acker *et al*
[346] Sheppy *et al*
[347] BPA, "Smart Power Strip Energy Savings Evaluation," Ross Complex, Vancouver, WA (2011)

Baseline Efficiencies from which Savings are Calculated
The baseline condition is an office workstation with no plug load control system.

Compliance Efficiency from which Incentives are Calculated
The compliance condition is an office workstation with a tier 1 plug load control advanced power strip.

Operating Hours
The annual operating hours of the measure, assuming that the APS is operating when it is reducing load, can be calculated by:

$$hours = \begin{bmatrix} (hrs_{wkday} - hrs_{wkday-open}) \\ + \\ (hrs_{wkend} - hrs_{wkend-open}) \end{bmatrix} \times \frac{8{,}760}{168}$$

Which is equal to 6,153 hours, assuming that the office is open for 50 hours on weekdays and 0 hours on weekends. Alternatively, the operating hours of the workstation standby loads are reduced by this amount, to 2,607 hours from 8,760 hours.

Effective Useful Life (EUL)
See Appendix P.

VENDING MACHINE AND NOVELTY COOLER TIME CLOCK

Measure Description

This measure is essentially an approach for controlling the operations of novelty coolers so that they are only operating when needed. The controls are a time-control system that allows the machines to be turned on and reach desired temperatures during the hours of business operations, but turned off during other times.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times kW_{vending} \times [(0.45 \times hrs_{off} \times 91) + (0.50 \times hrs_{off} \times 274)]$$

Peak Coincident Demand savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
Units = Number of measures installed under the program
kW = Based on nameplate Volts and Amps, Phase, and Power Factor.
vending = Vending machine
0.45 = Duty cycle during winter month nights
0.50 = Duty cycle during non-winter month nights
hrs_{off} = Potential off hours per night
91 = Days in winter months
274 = Days in non-winter months.

Summary of Variables and Data Sources

Variable	Value	Notes
0.45		Duty cycle during winter month nights, based on vendor estimates
0.50		Duty cycle during non-winter month nights, based on vendor estimates
hrs_{off}		Potential off hours per night. Calculated as, number of hours store closed per day minus one (controller turns unit back on one hour before store opens).

Coincidence Factor (CF)
The recommended value for the coincidence factor is N/A

APPLIANCE RECYCLING

AIR CONDITIONER – ROOM (WINDOW)

Measure Description

Room (Window) Air Conditioners, a consumer (appliance) product, other than a "packaged terminal air conditioner," which is powered by a single-phase electric current and is an encased assembly designed as a unit for mounting in a window or through the wall for the purpose of providing delivery of conditioned air to an enclosed space. It includes a prime source of refrigeration and may include a means for ventilating and heating [348]. Minimum energy conservation standards for these appliances have been established by the Code for Federal Regulations 10 CFR 430.32(b). As this standard continues to be revised, and by association ENERGY STAR® standards continue to increase, operational savings attributable to new RAC may justify early retirement before the full useful life has been exhausted. In order to realize the anticipated savings, a currently functioning appliance of equivalent cooling capacity and type having been manufactured before June 2014 must be properly disposed of when a new appliance is supplied to the customer.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings, Method using EER

$$\Delta kWh = \frac{Capacity}{1{,}000} \times \left(\frac{1}{EER_{baseline}} - \frac{1}{EER_{ee}}\right) \times EFLH_{cooling}$$

Annual Electric Energy Savings, Alternate Method using CEER[349]

$$\Delta kWh = \frac{Capacity}{1{,}000} \times \left(\frac{1}{CEER_{baseline}} - \frac{1}{CEER_{ee}}\right) \times EFLH_{cooling}$$

Peak Coincident Demand Savings, Method using EER

$$\Delta kW = \frac{Capacity}{1{,}000} \times \left(\frac{1}{EER_{baseline}} - \frac{1}{EER_{ee}}\right) \times CF$$

Peak Coincident Demand Savings, Alternate Method using CEER

$$\Delta kW = \frac{Capacity}{1{,}000} \times \left(\frac{1}{CEER_{baseline}} - \frac{1}{CEER_{ee}}\right) \times CF$$

[348] ENERGY STAR® Program Requirements, Product Specification for Room Air Conditioners, Eligibility Criteria Version 4.0, February 2015

[349] When available the Combined Energy Efficiency Ratio should be used for the purpose of calculating annual electric energy savings.

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
Capacity	= Cooling output rating, in BTU/hr
$EFLH_{cooling}$	= Cooling Equivalent Full-Load Hours
CF	= Coincidence Factor
CEER	= Combined Energy Efficiency Ratio
EER	= Energy Efficiency Ratio
$_{ee}$	= Energy efficient condition or measure
$_{baseline}$	= Baseline condition or measure
1,000	= Conversion factor (1,000 Watts / Kilowatt)

Packaged Terminal Air Conditioner (PTAC) is defined as a wall sleeve and a separate unencased combination of heating and cooling assemblies specified by the builder and intended for mounting through the wall.

RAC with louvered sides have exterior side vents to facilitate airflow over the outdoor coil.

RAC with reverse cycle are appliances that may reverse the refrigeration cycle so as to serve as heating equipment, also known as a heat pump.

Summary of Variables and Data Sources

Variable	Value	Notes
Capacity		From application.
$EFLH_{cooling}$		Cooling equivalent full-load hours by building type, Appendix G.
$CEER_{baseline}$		From application, or lookup from table below based on unit capacity when unknown.
$CEER_{ee}$		From application.
$EER_{baseline}$		From application, or lookup from table below based on unit capacity when unknown.
EER_{ee}		From application.

Coincidence Factor (CF)

The recommended coincidence factor for this measure is 0.703 for NYC and 0.305 elsewhere.[350]

[350] C&I Unitary HVAC Load Shape Project Final Report, KEMA, 2011, Table 0-6: NY - Inland and NY - Urban/Coastal

Baseline Efficiencies from which Savings are Calculated[351]

Baseline efficiency assumptions for normal replacement of units manufactured between the years 2000 – 2014 are shown below. Baseline efficiency of air conditioners manufactured after June 2014 will be the compliance efficiency.

Room Air Conditioners

Capacity (BTU/hr)	with Louvered Sides (EER_{base})	Capacity (BTU/hr)	without Louvered Sides (EER_{base})
< 6,000	≥ 9.7	< 6,000	≥ 9.0
6,000 – 7,999	≥ 9.7	6,000 – 7,999	≥ 9.0
8,000 – 13,999	≥ 9.8	8,000 – 10,999	≥ 8.5
14,000 – 19,999	≥ 9.7	11,000 – 13,999	≥ 8.5
20,000– 27,999	≥ 8.5	14,000– 19,999	≥ 8.5
≥ 28,000	≥ 8.5	≥ 20,000	≥ 8.5

Room Air Conditioners – Casement

Capacity (BTU/hr)	Casement Only (EER_{base})	Casement - Slider (EER_{base})
All	≥ 8.7	≥ 9 .5

Room (Air Conditioners with Reverse Cycle) Heat Pumps

Capacity (BTU/hr)	with Louvered Sides (EER_{base})	Capacity (BTU/hr)	without Louvered Sides (EER_{base})
≤ 19,999	≥ 9.0	≤ 13,999	≥ 8.5
≥ 20,000	≥ 8.5	≥ 14,000	≥ 8.0

Compliance Efficiency from which Incentives are Calculated[352]

Units will be treated as early retirement and total lifetime energy savings will be calculated based on remaining years of useful life (RUL) of the existing baseline unit. Units greater than 9 years old will be considered normal replacements and will be given incremental savings. Incremental savings are defined as the difference between the annual kWh consumption of minimally compliant with Federal appliance standards and the annual kWh consumption of the new unit.

Room Air Conditioners

Capacity (BTU/hr)	with Louvered Sides (EER_{ee})	Capacity (BTU/hr)	without Louvered Sides (EER_{ee})
< 6,000	≥ 11.0	< 6,000	≥ 10.0
6,000 – 7,999	≥ 11.0	6,000 – 7,999	≥ 10.0
8,000 – 13,999	≥ 10.9	8,000 – 10,999	≥ 9.6
14,000 – 19,999	≥ 10.7	11,000 – 13,999	≥ 9.5
20,000– 27,999	≥ 9.4	14,000– 19,999	≥ 9.3

[351] 10 CFR 430.32(b) Baseline EER based on manufactured dates between 10/1/2000 and 5/31/2014.
[352] 10 CFR 430.32(b) Compliance EER based on manufactured dates after 6/1/2014.

Capacity (BTU/hr)	with Louvered Sides (EER_{ee})	Capacity (BTU/hr)	without Louvered Sides (EER_{ee})
≥ 28,000	≥ 9.0	≥ 20,000	≥ 9.4

Room Air Conditioners – Casement

Capacity (BTU/hr)	Casement Only (EER_{ee})	Casement - Slider (EER_{ee})
All	≥ 9.5	≥ 10.4

Room (Air Conditioners with Reverse Cycle) Heat Pumps

Capacity (BTU/hr)	with Louvered Sides (EER_{ee})	Capacity (BTU/hr)	without Louvered Sides (EER_{ee})
≤ 19,999	≥ 9.8	≤ 13,999	≥ 9.3
≥ 20,000	≥ 9.3	≥14,000	≥ 8.7

Operating Hours

Reference Appendix G for applicable EFLH value for specific building use type and geographic location.

Effective Useful Life (EUL)

For equipment 9 years old or older:
Years: 9
Source: DEER 2014[353]

Remaining Useful Life (RUL)

For equipment less than 9 years old:
Years: 9 – (Current Year – Year Manufactured)

1. *Subtract the year of manufacture from the current year*
2. *Subtract the result of step (1) from 9*

BUILDING SHELL

COOL ROOF

Measure Description

Roofing material with reduced solar absorptance. The cool roof is assumed to have a solar absorptance of 0.3 compared to a standard roof with solar absorptance of 0.8. Due to negative impacts on space heating, this measure is applicable to buildings with air conditioning and gas heat only.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times k(SF_{cool\ roof}) \times \left(\frac{\Delta kWh}{kSF}\right)$$

Peak Coincident Demand Savings

$$\Delta kW = units \times k(SF_{cool\ roof}) \times \left(\frac{\Delta kW}{kSF}\right) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times k(SF_{cool\ roof}) \times \left(\frac{\Delta therm}{kSF}\right)$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms =Annual gas energy savings
units = Number of measures installed under the program
k = Thermal conductivity
SF = Square feet
cool roof = Cool roof
CF = Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
area	sq ft of roof	From application
kSF		Calculated from thousand square feet of cool roof installed over a cooled space.
ΔkW/kSF		Lookup by building type and city, see Appendix I.
Building type		From application
ΔkW/kSF		Electricity demand savings per thousand square foot of cool

Variable	Value	Notes
		roof
ΔkWh/kSF		Electricity consumption savings per square foot of cool roof
Δtherm/kSF		Natural gas consumption impact per thousand square foot of cool roof installed over a heated space.

Coincidence Factor (CF)
The recommended value for the coincidence factor is 0.8.

Baseline Efficiencies from which Savings are Calculated
Unit energy and demand savings were calculated from a DOE-2.2 simulation of a series of prototypical small commercial buildings. The prototype building characteristics are described in Appendix A. The unit energy and demand savings for eight building types across seven different cities in NY are shown in Appendix I.

The baseline condition for roofing material is assumed to have a solar absorptance of 0.8.

Compliance Efficiency from which Incentives are Calculated
The cool roof is assumed to have a solar absorptance of 0.3

Operating Hours
The HVAC system operating hours vary by building type. See Appendix A.

Effective Useful Life (EUL):
Years: 15
Source: DEER

Ancillary Fossil Fuel Savings Impacts
Reducing roofing material solar absorptance increases space-heating requirements. The therm impacts are detailed above.

Ancillary Electric Savings Impacts

Window – Film

Measure Description

Window films with reduced solar heat gain coefficient applied to single pane clear glass in commercial buildings. Due to negative impacts on space heating, this measure is applicable to buildings with electric AC and gas heat only.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times Glazing\ area\ (100\ SF) \times (\Delta kWh/\ 100\ SF)$$

Peak Coincident Demand Savings

$$\Delta kW = units \times Glazing\ area\ (100\ SF) \times (\Delta kW/100\ SF) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times Glazing\ area\ (100SF) \times (\Delta therm/\ 100\ SF)$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
CF = Coincidence factor
Glazing area = Aperture area of windows treated by window films in 100 SF

Summary of Variables and Data Sources

Variable	Value	Notes
Area		From application
ΔkWh/100SF		Electricity consumption savings per 100 SF of glazing area , lookup by building type and city
ΔkW/100SF		Electricity demand savings per 100 SF of glazing area, lookup by building type and city
Δtherm/100SF		Gas consumption impact per 100 square foot of glazing, lookup by building type and city
Building type		From application; use cross reference table as needed
HVAC type		Weighted average for built up systems as applicable

Unit energy and demand savings were calculated from a DOE-2.2 simulation of a series of prototypical small commercial buildings. The prototype building characteristics are described in Appendix A. The unit energy and demand savings for commercial and industrial building types across seven different cities in NY are shown in Appendix F.

Coincidence Factor (CF)
The recommended value for the coincidence factor is 0.8.

Baseline Efficiencies from which Savings are Calculated

The baseline condition is assumed to be single pane clear glass with a solar heat gain coefficient of 0.87 and U-value of 1.2 BTU/hr-SF-°F.

Compliance Efficiency from which Incentives are Calculated
The window film is assumed to provide a solar heat gain coefficient of 0.40 or less.

Operating Hours
The HVAC system operating hours vary by building type. See Appendix A.

WINDOW – GLAZING

Measure Description

ENERGY STAR® windows with reduced thermal conductance and solar heat gain coefficient.[354]

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times \frac{area_g}{100} \times \frac{\Delta kWh}{100\ ft^2} \times \frac{SEER_{baseline}}{SEER_{part}} \times \left[\frac{\bar{\eta}_{dist,baseline}}{\bar{\eta}_{dist,part}}\right]_{cooling}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times \frac{area_g}{100} \times \frac{\Delta kW}{100\ ft^2} \times \frac{EER_{baseline}}{EER_{part}} \times \left[\frac{\eta_{dist,pk,baseline}}{\eta_{dist,pk,part}}\right]_{cooling} \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times \frac{area_g}{100} \times \frac{\Delta therm}{100\ ft^2} \times \frac{AFUE_{baseline}}{AFUE_{part}} \times \left[\frac{\bar{\eta}_{dist,baseline}}{\bar{\eta}_{dist,part}}\right]_{heating}$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
CF	= Coincidence factor
EER	= Energy efficiency ratio under peak conditions
SEER	= Seasonal average energy efficiency ratio over the cooling season, BTU/watt-hour, (used for average U.S. location/region)
AFUE	= Annual fuel utilization efficiency, seasonal energy efficiency for fuel heating equipment
baseline	= Baseline condition or measure
part	= Participant
dist	= Distribution
heating	= Heating
cooling	= Cooling
pk	= Peak
$\bar{\eta}$	= Average energy efficiency (0 -100%)
η	= Energy efficiency (0 -100%)

[354] ENERGY STAR® Product Specification Residential Windows, Doors, and Skylights, Eligibility Criteria, V6.0, January 2014

$area_g$ = Glazing area (in ft^2)

Summary of Variables and Data Sources[355]

Variable	Value	Notes
$area_g$		Glazing area rom application
$\Delta kWh/100\ ft^2$		Electricity consumption savings per 100 square feet of glazing area, lookup by building type and city, use existing window type or vintage default for baseline.
$\Delta kW/100\ ft^2$		Electricity demand savings per 100 square feet of glazing area, lookup by building type and city, use existing window type or vintage default for baseline.
$\Delta therm/100\ ft^2$		Gas consumption impact per 100 square foot of glazing, lookup by building type and city, use existing window type or vintage default for baseline.
$EER_{baseline}$	11.2	EER used in the simulations[356]
EER_{part}		EER of cooling systems within participant population, defaults to $EER_{baseline}$ (no adjustment)
$SEER_{baseline}$	14	SEER used in the simulations[357]
$SEER_{part}$		SEER of cooling system within participant population, defaults to $SEER_{baseline}$ (no adjustment)
$AFUE_{baseline}$	80%	AFUE used in the simulations[358]
$AFUE_{part}$		AFUE of heating system within participant population, defaults to $AFUE_{baseline}$ (no adjustment)
$\bar{\eta}_{dist,baseline}$	0.956	Distribution system seasonal efficiency used in simulations
$\bar{\eta}_{dist,part}$		Distribution system seasonal efficiency within participant population, defaults to $\bar{\eta}_{dist,baseline}$ (no adjustment)
$\eta_{dist,pk,baseline}$	0.956	Distribution system efficiency under peak conditions used in simulation
$\eta_{dist,pk,part}$		Distribution system efficiency under peak conditions within participant population defaults to $\eta_{dist,pk,baseline}$ (no adjustment)

Unit energy and demand savings calculated from the building prototype simulation models are shown in Appendix F. The savings are tabulated by location, building type, and HVAC system type for a variety of combinations of existing window and improved window types.

Coincidence Factor (CF)

The suggested coincidence factor for this measure is 0.822 for NYC and 0.477 elsewhere.[359].

[355] Due to schedule of revisions, values specified here may not align with those presented throughout appendices.
[356] ECCCNYS 2016, Table C403.2.3(1) – Assumes a 5-ton packaged AC.
[357] Ibid.
[358] ECCCNYS 2016, Table C403.2.3(5) – Assumes a 150 MBh gas boiler.
[359] C&I Unitary HVAC Load Shape Project Final Report, KEMA, 2011, Table 0-5: NY - Inland and NY - Urban/Coastal

Baseline Efficiencies from which Savings are Calculated
A variety of existing window combinations are shown in the unit savings tables, including single pane clear glass, double pane clear glass and a minimally code compliant window. Energy savings are estimated based on the characteristics of the existing window. Single pane clear glass is the default for the old vintage, while double pane clear glass is the default for the average vintage. The minimally code compliant window as assumed to be the base case for new construction or window replacement projects.

Compliance Efficiency from which Incentives are Calculated
A typical window meeting the current ENERGY STAR® specifications is assumed to be the installed measure. The specifications assumed are listed below[360]:

U-Factor (Btu/h ft^2-^{o}F)	Solar Heat Gain Coefficient (SHGC)
≤0.27	Any
0.28	≥0.32
0.29	≥0.37
0.30	≥0.42

Operating Hours
The energy savings for windows are dependent on the HVAC system operating hours and thermostat set points. See Appendix A for the modeling assumptions for each building prototype.

COMPRESSED AIR

AIR COMPRESSOR

Measure Description

This measure covers the installation of oil-flooded, rotary screw air compressors with variable frequency drives or variable displacement controls and properly sized air receivers in commercial and industrial compressed air systems (single compressor systems only). Inlet valve modulation, which modulates the compressor by throttling the air inlet and load/unload control, which switches the compressor to unload when the cut-out pressure set point is reached, are inefficient means of compressed air system control under part load conditions. Variable frequency drives vary capacity by controlling the frequency of the electrical signal to and speed of the motor while variable displacement controls change compressor capacity by varying the amount of the compressor used to compress air. Both represent a significant improvement in part load operating efficiency and savings over the baseline condition.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times hp_{comp} \times (\Delta kW/hp) \times hrs$$

Peak Coincident Demand Savings

$$\Delta kW = units \times hp_{comp} \times (\Delta kW/hp) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
hp_{comp} = Horsepower of air compressor
(ΔkW/hp) = Demand electric savings per horsepower
hrs = Annual operating hours of air compressor
CF = Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
hp_{comp}		From application
(ΔkW/hp)		Lookup in table below based on compressor size and control strategy.[362]
hrs		From application
CF	0.8	

Air Compressor Deemed Savings (ΔkW/hp)

Control type	Compressor hp	ΔkW/hp
Variable Frequency Drive	≥ 15 and < 25	0.207
Variable Frequency Drive	≥ 25 and < 75	0.206
Variable Displacement	≥ 50 and < 75	0.116

Coincidence Factor (CF)
The recommended value for the coincidence factor is 0.8[363]

Baseline Efficiencies from which Savings are Calculated
The baseline condition is an oil-flooded, rotary screw compressor utilized in a single compressor system meeting the requirements of ISO Standard 8573.1 with inlet modulating or load/unload control and blow down capability.

Compliance Efficiency from which Incentives are Calculated
The compliance condition is an oil-flooded, rotary screw compressor utilized in a single compressor system meeting the requirements of ISO Standard 8573.1 with variable speed drive or variable displacement capacity control and a properly sized air receiver. Flow controller must be used to maintain 5-10 psi pressure difference between receiver and distribution system.

Operating Hours
The operating hours of compressed air systems vary widely and shall be defined by the application.

Effective Useful Life (EUL)

AIR DRYER - REFRIGERATED

Measure Description

High efficiency air dryers utilizing a refrigeration system to condense and remove moisture from a compressed air system.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = CFM_{dryer} \times (\Delta kW/CFM) \times hr$$

Peak Coincident Demand Savings

$$\Delta kW = CFM_{dryer} \times (\Delta kW/CFM) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
CFM_{dryer} = Full flow rated capacity of refrigerated air dryer (cfm)
ΔkW/cfm = kW reduction per full flow rated cfm
Hr = Annual operating hours of dryer
CF = Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
CFM_{dryer}		From application
ΔkW/cfm		Lookup based on dryer size From MA TRM
hours		From application
ΔkW/CFM	0.005	Dryer capacity (CFM_{dryer}) <100
	0.004	Dryer capacity (CFM_{dryer}) ≥ 100 and < 200
	0.003	Dryer capacity (CFM_{dryer}) ≥ 200 and < 300
	0.003	Dryer capacity (CFM_{dryer}) ≥ 300 and < 400
	0.003	Dryer capacity (CFM_{dryer}) ≥ 400

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.8.

Baseline Efficiencies from which Savings are Calculated
Non-cycling refrigerated air dryer.

Compliance Efficiency from which Incentives are Calculated
High efficiency refrigerated dryer.

Operating Hours
Varies by application.

ENGINEERED AIR NOZZLE

Measure Description

This section covers engineered compressed air nozzles. Engineered nozzles entrain building air with compressed air to provide effective air nozzle action while reducing compressed air system air flow.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = (FLOW_{baseline} - FLOW_{eng}) \times kW_{scfm} \times \%_{use} \times hr$$

Peak Coincident Demand Savings

$$\Delta kW = \Delta kWh / hr \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times \Delta therm_{wh} + \Delta therm_{dryer}$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
$FLOW_{baseline}$ = Open nozzle flow
$FLOW_{eng}$ = Engineered nozzle flow
$kW/_{scfm}$ = Air compressor kW per cfm air delivery at 100 psi
$\%_{use}$ = Percent of compressor operating hours where nozzle is in use
hr = Annual operating hours
CF = Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
$FLOW_{baseline}$	Lookup based on nozzle size	Nozzle size from application
$FLOW_{eng}$	Lookup based on nozzle size	Nozzle size from application
$kW/_{scfm}$	0.29	Value taken from Ohio TRM
$\%_{use}$	0.05	
hr		Annual operating hours of air compressor, from application

	Standard Nozzle (SCFM) at 100 psi	Engineered Nozzle (SCFM) at 100 psi
1/8 in. nozzle	21	6
¼ in. nozzle	58	11

Coincidence Factor (CF)
The recommended value for the coincidence factor is 0.75.

Baseline Efficiencies from which Savings are Calculated
Typical modulating compressor with blow down system assumed, with baseline nozzle as defined above.

Compliance Efficiency from which Incentives are Calculated
Typical modulating compressor with blow down system assumed, with efficient nozzle as defined above.

Operating Hours
Nozzles assumed to be in use 5% of the time the compressor system is available.

No Air Loss Water Drain

Measure Description

This section covers a no-loss compressed air system water drain. No-loss drains allow water to drain from the compressed air system without compressed air loss.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times (\Delta kW/drain) \times hrs$$

Peak Coincident Demand Energy Savings

$$\Delta kW = units \times (\Delta kW/drain) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
hr = Annual operating hours
CF = Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
units		Number of drains, from application
ΔkW/drain	0.3kW	National Grid recommended value
hrs		Annual operating hours of air compressor, from application

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.8.

Baseline Efficiencies from which Savings are Calculated

Electronic solenoid / timed drains.

Compliance Efficiency from which Incentives are Calculated

No loss drain with a Load/No-load with appropriately sized storage, VSD or variable displacement compressor.

Operating Hours

Varies by application.

Effective Useful Life (EUL):
Years: 15
Source: Ohio TRM

DOMESTIC HOT WATER

INDIRECT WATER HEATER

Measure Description

This measure covers the installation of a gas-fired indirect water heater in which the stored water is heated via hot water or steam produced by a gas boiler rather than direct input from electric elements or gas burners. In such a system, a heat exchanger separates the potable water in the water heater from the boiler water. This measure applies to small commercial indirect systems comprising a boiler with input heating capacity less than 300,000 BTU/hr and greater than or equal to 4,000 BTU/hr per gallon of stored water.[364]

This measure estimates savings associated with the delivery of potable hot water only and assumes the installation of zone priority controls to interrupt demand for space heating until domestic hot water demand is met. Larger equipment as well as equipment where zone priority control is not feasible shall be treated under a custom application.

The baseline assumption for indirect water heaters is a minimally code compliant tank type water heater or an indirect system with a minimally code compliant boiler, based on actual existing conditions. For new construction, a tank type baseline shall be assumed.

Method for Calculating Annual Energy and Peak Coincidence Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = N/A$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = units \times \left[\frac{GPD \times 365 \times 8.33 \times \Delta T_{main}}{100{,}000} \times \left[\frac{1}{Eff_{baseline}} - \frac{1}{Eff_{ee}}\right] + \left[\frac{UA_{baseline}}{Eff_{baseline}} - \frac{UA_{ee}}{Eff_{ee}}\right] \times \frac{\Delta T_{amb}}{100{,}000} \times 8{,}760\right]$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
GPD	= Gallons per day
ΔT_{main}	= Average temperature difference between water heater set point temperature and

[364] 10 CFR 431.102

	the supply water temperature in water main (°F)
ΔT_{amb}	= Average temperature difference between water heater set point temperature and the surrounding ambient air temperature (°F)
$_{baseline}$	= Baseline condition or measure
$_{ee}$	= Energy efficient condition or measure
Eff	= Efficiency
UA	= Overall heat loss coefficient (BTU/hr-°F)
365	= Days in one year
8.33	= Energy required (BTU) to heat one gallon of water by one degree Fahrenheit
100,000	= Conversion factor (BTU/therm), one therm equals 100,000 BTU
8,760	= Hours in one year

Summary of Variables and Data Sources

Variable	Value	Notes
GPD		From application, or lookup/calculate based on building type, square footage and occupancy from GPD table below.
ΔT_{main}	$T_{set} - T_{main}$	Average temperature difference between water heater set point temperature and the supply water temperature in water main (°F).
ΔT_{amb}	$(T_{set} - T_{amb})$	Average temperature difference between water heater set point temperature and the surrounding ambient air temperature (°F).
T_{set}		Water heater set point temperature (°F), per application or use 140°F as a default.[365]
T_{main}		Supply water temperature in water main (°F). Lookup in Cold Water Inlet Temperature table below based on nearest city. (°F).
T_{amb}	70	Surrounding ambient air temperature (°F).[366]
$Eff_{baseline}$		Efficiency of baseline condition. Lookup in Baseline Efficiencies section below.
Eff_{ee}		Efficiency of energy efficient indirect-system boiler (AFUE) from application.
$UA_{baseline}$		Overall heat loss coefficient of the baseline condition (BTU/hr-°F). Calculate based on baseline standby loss per the Baseline Heat Loss Coefficient section below.
UA_{ee}		Overall heat loss coefficient of the energy efficient measure (BTU/hr-°F). Calculate based on energy efficient standby loss per the Qualifying Heat Loss Coefficient section below.

365 Per OSHA recommendations for prevention of Legionella bacterial growth (https://www.osha.gov/dts/osta/otm/legionnaires/hotwater.html)

366 Water heaters are generally located in conditioned or partially conditioned spaces with a typical average temperature of 65°F to 70°F to avoid freezing. A value of 70°F is used for the purposes of estimating tank/ambient air temperature differential, which aligns with standby loss specification testing standards.

Gallons per Day (GPD)

The average daily hot water usage, expressed in gallons per day, for several commercial facility types is tabulated below. Daily hot water usage can be calculated based on the GPD and site-specific metric in the Rate column, or default values can be referenced directly from the GPD column.

Building Type	GPD	Rate	Notes/Assumptions	Source
Assembly	239	7.02 GPD per 1,000 SF	Assumes 10% hot water, 34,000 SF	EIA[367]: Public Assembly
Auto Repair	25	4.89 GPD per 1,000 SF	Assumes 10% hot water, 5,150 SF	EIA: Other
Big Box Retail	448	3.43 GPD per 1,000 SF	Assumes 10% hot water, 130,500 SF	EIA: Mercantile
Community College	1,520	1.9 GPD per person	Assumes 800 students	NREL[368]: School with Showers
Dormitory	8,600	17.2 GPD per resident	Assumes 500 residents	Water Research Foundation[369]

[371] Burch, Jay and Christensen, Craig, "Towards Development of an Algorithm for Mains Water Temperature." National Renewable Energy Laboratory

[372] Average annual outdoor temperatures taken from NCDC 1981-2010 climate normals

City	Annual average outdoor temperature[372] (°F)	T_{main} (°F)
Massena	43.5	49.5
NYC	55.4	61.4
Poughkeepsie	49.8	55.8
Syracuse	48.3	54.3

Baseline Heat Loss Coefficient ($UA_{baseline}$)

$UA_{baseline}$ is calculated from the assumed equipment standby loss specification ($SL_{baseline}$), which is determined per minimum effective federal standards for commercial gas storage type water heaters (see Baseline Standby Losses section below).[373]

$$UA_{baseline} = \frac{SL_{baseline}}{70}$$

where:

$SL_{baseline}$ = Standby heat loss (BTU/hr) specification. For the baseline condition ($SL_{baseline}$), use the intermediate standby loss equation from the Baseline Standby Losses section below.

70 = Temperature difference associated with standby loss specification (°F)[374]

Baseline Standby Losses ($SL_{baseline}$)

Standby losses ($SL_{baseline}$) for commercial gas storage type water heaters:[375]

$$SL_{baseline} = \frac{Q_{baseline}}{800} + 110\sqrt{v_{baseline}}$$

where:

$v_{baseline}$ = Baseline tank volume (gal), equal to the storage capacity of the proposed equipment

$Q_{baseline}$ = Baseline input capacity (BTU/hr), equal to the input capacity of the proposed equipment

[373] 10 CFR 429, 430, and 431 Docket No. EERE-2015-BT-TP-0007, Energy Conservation Program for Consumer Products and Certain Commercial and Industrial Equipment: Test Procedures for Consumer and Commercial Water Heaters

[374] Ibid.

[375] Ibid.

Qualifying Heat Loss Coefficient (UA_{ee})
Indirect water heater storage tanks are tested and rated for standby losses (in °F/hr or BTU/hr) at standard testing conditions in accordance with testing standards.[376]

For equipment with standby losses rated in °F/hr, the qualifying equipment standby loss specification (SL_{ee}) shall be used in the formula below, along with tank volume (v_{ee}) to establish the qualifying equipment heat loss coefficient (UA_{ee}).

$$UA_{ee} = \frac{SL_{ee}}{70} \times v_{ee} \times 8.33$$

where:

UA_{ee} = Overall heat loss coefficient (BTU/hr-°F) of the energy efficient condition or measure
SL_{ee} = Standby loss specification (°F/hr) of the energy efficient condition or measure
v_{ee} = Rated storage capacity (gallons) of the energy efficient condition or measure
70 = Temperature difference associated with standby loss specification (°F)[377]
8.33 = Energy required (BTU) to heat one gallon of water by one degree Fahrenheit

For equipment with standby losses rated in BTU/hr, the qualifying equipment standby loss specification (SL_{ee}) shall be used in the formula below to establish the qualifying equipment heat loss coefficient (UA_{ee})

$$UA_{ee} = \frac{SL_{ee}}{70}$$

where:

UA_{ee} = Overall heat loss coefficient (BTU/hr-°F) of the energy efficient condition or measure
SL_{ee} = Standby loss specification (BTU/hr) of the energy efficient condition or measure
70 = Temperature difference associated with standby loss specification (°F)[378]

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A.

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a minimally code compliant gas storage type or indirect water heater (based on actual existing conditions) with efficiency per the Energy Conservation Construction

[376] GAMA Testing Standard: Performance of Indirect-Fired Water Heaters, March 2003
[377] 10 CFR 429, 430, and 431 Docket No. EERE-2015-BT-TP-0007, Energy Conservation Program for Consumer Products and Certain Commercial and Industrial Equipment: Test Procedures for Consumer and Commercial Water Heaters
[378] Ibid.

Code of New York State[379] and the New York City Energy Conservation Code[380] as shown in the table below. Heat loss coefficient of the baseline condition shall be established as indicated in the Baseline Heat Loss Coefficient section above. Measure is only applicable to small commercial (<300,000 BTU/hr) equipment in applications with zone priority control. Baseline tank volume and input capacity shall be set equal to the energy efficient condition. For new construction, a tank type baseline shall be assumed.

Equipment Type/Size	Efficiency
Tank Type: All Sizes	0.80 E_t
Gas Boiler: < 300,000 BTU/hr	0.80 AFUE
Steam Boiler, All Except Natural Draft: < 300,000 BTU/hr	0.75 AFUE
Steam Boiler, Natural Draft: < 300,000 BTU/hr	0.75 AFUE

Compliance Efficiency from which Incentives are Calculated
The compliance condition is a small commercial (<300,000 BTU/hr) gas-fired indirect water heater meeting minimum performance requirements as dictated by program eligibility criteria in applications with zone priority control.

Operating Hours
Water heater run hours are not utilized in the estimation of energy or demand savings, but water heater is assumed to be available for operation 8,760 hours per year. Additionally, it is assumed standby losses are incurred 8,760 hours per year.

Effective Useful Life (EUL)
See Appendix P.

Ancillary Fossil Fuel Savings Impacts
Reduction in standby heat losses will have a negligible impact on space heating when the water heater is located in a conditioned space. Consideration of these effects is not included in this methodology.

Ancillary Electric Savings Impacts
Reduction in standby heat losses will have a negligible impact on space heating when the water heater is located in a conditioned space. Consideration of these effects is not included in this methodology.

STORAGE TANK WATER HEATER

Measure Description

This measure covers the installation of gas and electric storage tank water heaters designed to heat and store water at a thermostatically controlled temperature. This measure applies to potable hot water delivery only; it is not applicable to hot water heaters used for process loads or space heating.

Storage type units include commercial gas storage water heaters with a nominal input of greater than 75,000 BTU per hour and less than 4,000 BTU per hour per gallon of stored water and commercial electric storage water heaters with a nominal input of greater than 12 kilowatts and less than 4,000 Btu per hour per gallon of stored water.[381]

This measure applies to replacement of existing storage type water heaters using the same heating fuel (gas or electric) as the proposed case. For new construction, this measure assumes baseline to be a standard efficiency water heater using the same heating fuel (gas or electric) as the proposed case.

This measure applies to commercial grade water heaters only. For residential-duty water heaters installed in commercial settings, the Residential Storage Tank and Instantaneous Domestic Water Heater methodology detailed in this document shall be employed utilizing typical GPD values as defined in the "Gallons per Day (GPD)" section below.

Method for Calculating Annual Energy and Peak Coincidence Demand Savings

Annual Electric Energy Savings (Electric Equipment Only)

$$\Delta kWh = units \times \frac{GPD \times 365 \times 8.33 \times \Delta T_{main}}{3{,}412} \times \left[\frac{1}{E_{t,baseline}} - \frac{1}{E_{t,ee}}\right]$$

Peak Coincident Demand Savings (Electric Equipment Only)

$$\Delta kW = units \times \frac{(UA_{baseline} - UA_{ee}) \times \Delta T_{amb}}{3{,}412} \times CF$$

Annual Gas Energy Savings (Gas Equipment Only)

$$\Delta therm = units \times \frac{GPD \times 365 \times 8.33 \times \Delta T_{main}}{100{,}000} \times \left[\frac{1}{E_{t,baseline}} - \frac{1}{E_{t,ee}}\right]$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
GPD = Gallons per day

381 10 CFR 431.102

ΔT_{main}	= Average temperature difference between water heater set point temperature and the supply water temperature in water main (°F)
ΔT_{amb}	= Average temperature difference between water heater set point temperature and the surrounding ambient air temperature (°F)
baseline	= Baseline condition or measure
ee	= Energy efficient condition or measure
E_t	= Thermal efficiency
UA	= Overall heat loss coefficient (BTU/hr-°F)
CF	= Coincidence factor
365	= Days in one year
8.33	= Energy required (BTU) to heat one gallon of water by one degree Fahrenheit
3,412	= Conversion factor, one kWh equals 3,412 BTU
100,000	= Conversion factor (BTU/therm), one therm equals 100,000 BTU

Summary of Variables and Data Sources

Variable	Value	Notes
GPD		From application, or lookup/calculate based on building type, square footage and occupancy from GPD table below.
ΔT_{main}	T_{set} - T_{main}	Average temperature difference between water heater set point temperature and the supply water temperature in water main (°F)
ΔT_{amb}	(T_{set} - T_{amb})	Average temperature difference between water heater set point temperature and the surrounding ambient air temperature (°F)
T_{set}		Water heater set point temperature (°F), per application or use 140°F as a default.[382]
T_{main}		Supply water temperature in water main (°F). Lookup in Cold Water Inlet Temperature table below based on nearest city.
T_{amb}	70	Surrounding ambient air temperature (°F).[383]
$E_{t,baseline}$	Electric – 0.98 Gas – 0.80	Thermal efficiency of the baseline condition[384,385]
$E_{t,ee}$		Thermal efficiency for energy efficient measure, from application

382 Per OSHA recommendations for prevention of Legionella bacterial growth (https://www.osha.gov/dts/osta/otm/legionnaires/hotwater.html)

383 Water heaters are generally located in conditioned or partially conditioned spaces with a typical average temperature of 65°F to 70°F to avoid freezing. A value of 70°F is used for the purposes of estimating tank/ambient air temperature differential, which aligns with standby loss specification testing standards.

384 Gas: 10 CFR 431.110 (a)

385 Electric: Per 10 CFR 430 Subpart B Appendix E – Uniform Test Method for Measuring the Energy Consumption of Water Heaters: *6.3.2 Recovery Efficiency*

Variable	Value	Notes
$UA_{baseline}$		Overall heat loss coefficient of the baseline condition (BTU/hr-°F). Calculate based on baseline standby loss per the Overall Heat Loss Coefficient section below.
UA_{ee}		Overall heat loss coefficient of the energy efficient measure (BTU/hr-°F). Calculate based on energy efficient standby loss per the Overall Heat Loss Coefficient section below.

Gallons per Day (GPD)

The average daily hot water usage, expressed in gallons per day, for several commercial facility types is tabulated below. Daily hot water usage can be calculated based on the GPD and site-specific metric in the Rate column, or default values can be referenced directly from the GPD column.

Building Type	GPD	Rate	Notes/Assumptions	Source
Assembly	239	7.02 GPD per 1,000 SF	Assumes 10% hot water, 34,000 SF	EIA[386]: Public Assembly
Auto Repair	25	4.89 GPD per 1,000 SF	Assumes 10% hot water, 5,150 SF	EIA: Other
Big Box Retail	448	3.43 GPD per 1,000 SF	Assumes 10% hot water, 130,500 SF	EIA: Mercantile
Community College	1,520	1.9 GPD per person	Assumes 800 students	NREL[387]: School with Showers
Dormitory	8,600	17.2 GPD per resident	Assumes 500 residents	Water Research Foundation[388]
Elementary School	250	0.5 GPD per student	Assumes 500 students	NREL: School

389 Food Service Technology Center, Design Guide – Energy Efficient Heating, Delivery and Use, Table 1. Typical hot water system cost for restaurants, March 2010

Cold Water Inlet Temperature (T_{main})
Supply water main temperatures vary according to climate, and are approximately equal to the annual average outdoor temperature plus 6°F.[390] Supply main temperatures based on the annual outdoor temperature are shown below.

City	Annual average outdoor temperature[391] (°F)	T_{main} (°F)
Albany	48.3	54.3
Binghamton	46.3	52.3
Buffalo	48.3	54.3
Massena	43.5	49.5
NYC	55.4	61.4
Poughkeepsie	49.8	55.8
Syracuse	48.3	54.3

Overall Heat Loss Coefficient ($UA_{baseline}$ and UA_{ee})
Tank overall heat loss coefficient is calculated from the equipment standby loss specification. For UA_{ee}, the manufacturer specified standby loss shall be applied directly to the UA formula below. To calculate $UA_{baseline}$, use the appropriate intermediate standby loss equation from the Baseline Standby Losses section below.

$$UA = \frac{SL}{70}$$

where:
SL = Standby heat loss (BTU/hr), from application for the energy efficient measure (SL_{ee}). For the baseline condition ($SL_{baseline}$), use the appropriate intermediate standby loss equation from the Baseline Standby Losses section below.
70 = Temperature difference associated with standby loss specification (°F)[392]

Baseline Standby Losses ($SL_{baseline}$)
Standby losses ($SL_{baseline}$) for commercial electric storage type water heaters:[393]

$$SL_{baseline} = 20 + 35\sqrt{v_{baseline}}$$

[390] Burch, Jay and Christensen, Craig, "Towards Development of an Algorithm for Mains Water Temperature." National Renewable Energy Laboratory
[391] Average annual outdoor temperatures taken from NCDC 1981-2010 climate normals
[392] 10 CFR 429, 430, and 431 Docket No. EERE-2015-BT-TP-0007, Energy Conservation Program for Consumer Products and Certain Commercial and Industrial Equipment: Test Procedures for Consumer and Commercial Water Heaters
[393] Ibid.

where:
$v_{baseline}$ = Baseline tank volume (gal), equal to the storage capacity of the proposed equipment

Standby losses ($SL_{baseline}$) for commercial gas storage type water heaters:[394]

$$SL_{baseline} = \frac{Q_{baseline}}{800} + 110\sqrt{v_{baseline}}$$

where:
$v_{baseline}$ = Baseline tank volume (gal), equal to the storage capacity of the proposed equipment
$Q_{baseline}$ = Baseline input capacity (BTU/hr), equal to the input capacity of the proposed equipment

Coincidence Factor (CF)
The recommended value for the coincidence factor is 0.8[395]

Baseline Efficiencies from which Savings are Calculated
The baseline condition for replacement measures is a standard efficiency gas or electric storage type water heater (based on proposed conditions) with tank volume and input capacity equivalent to the proposed case, UA value calculated as prescribed above and a thermal efficiency of 0.80 (gas) or 0.98 (electric).

Compliance Efficiency from which Incentives are Calculated
The compliance condition is a gas or electric storage type water heater as defined in the Measure Description section above meeting minimum performance requirements dictated by program eligibility criteria.

Effective Useful Life (EUL)
See Appendix P.

Operating Hours
Water heater run hours are not utilized in the estimation of energy or demand savings, but water heater is assumed to be available for operation 8,760 hours per year. Additionally, it is assumed standby losses are incurred 8,760 hours per year.

Ancillary Fossil Fuel Savings Impacts
Reduction in standby heat losses will have a negligible impact on space heating when the water heater is located in conditioned space. Consideration of these effects is not included in this methodology.

Ancillary Electric Savings Impacts
High-efficiency water heaters may incorporate a draft fan, which increases electricity

[394] 10 CFR 429, 430, and 431 Docket No. EERE-2015-BT-TP-0007, Energy Conservation Program for Consumer Products and Certain Commercial and Industrial Equipment: Test Procedures for Consumer and Commercial Water Heaters
[395] *No source specified – update pending availability and review of applicable references.*

consumption. Additionally, reduction in standby heat losses will have a negligible impact on space heating and cooling when the water heater is located in conditioned space. Consideration of these effects is not included in this methodology.

DOMESTIC HOT WATER (DHW) – CONTROL

FAUCET – LOW FLOW AERATOR

Measure Description

A faucet aerator is a water saving device that, by federal guidelines that went into effect in 1994, enables no more than 2.2 gallons per minute (gpm) to pass through the faucet. A low flow faucet aerator can reduce water flow to 1.5 gpm while maintaining appropriate water pressure and flow.

Method for Calculating Annual Energy and Peak Coincident Demand Savings[396]

Annual Energy Savings Method

The savings estimations were derived through the following steps:

Water Savings = ((Standard – low flow aerator GPM) × (duration/use) × (#uses/day) × (days/year))

Develop estimate of annual gallons of water saved from the measure

$$H_2O_{Sav} = (GPM_{baseline} - GPM_{ee}) \times Dur \times Use \times Days$$

where:

H_2O_{Sav} = Water savings
GPM = Gallons per minute
$_{baseline}$ = Baseline condition or measure
$_{ee}$ = Energy efficient condition or measure
Dur = Duration of water flow per usage
Use = Uses of water per day
Days = Days per year

Annual Electric Energy Savings

$$\Delta kWh = ((H2^0{}_{Sav} \times (T_{faucet} - T_{heater}) \times 8.33/3{,}412)) / EF_{electric}$$

where:

ΔkWh = Electric energy savings
H_2O_{Sav} = Water savings (calculated from above)
T_{faucet} = Temperature of faucet water
T_{heater} = Temperature to heater
8.33 = Energy required (BTU's), to heat one gallon of water by one degree Fahrenheit
3,412 = Conversion factor, one kW equals 3,412.14 BTU/h
$EF_{electric}$ = Energy factor for electric water heater

[396] This methodology is derived from CL&P and UI Program Savings Documentation for 2008 Program Year, pp. 157-158.

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = H20_{Sav} \times (T_{faucet} - T_{heater}) \times (8.33/100{,}000)) / EF_{gas}$$

where:

H_2O_{Sav} = Water savings (calculated from above)
T_{faucet} = Temperature of faucet water
T_{heater} = Temperature to heater
8.33 = Energy required (BTU's), to heat one gallon of water by one degree Fahrenheit
100,000 = Conversion factor (BTU/therm), one therm equals 100,000 BTU's
EF_{gas} = Energy factor for natural gas water heater

Summary of Variables and Data Sources

Variable	Value	Notes
GPM_{ee}	1.5	Gallons per minute for energy efficient measure
$GPM_{baseline}$	2.2	Gallons per minute for baseline measure
Duration of use (minutes)	0.5	
Uses per day	30	
Days per year	260	Average days of operation for businesses
T_{faucet}	80	Temperature of water at faucet
T_{main}		Average T_{main} based on upstate or downstate
Water heater efficiency	0.97	Standard assumptions for electric water heater efficiency
	0.67	Standard assumptions for natural gas water heater efficiency

The table below provides the baseline (standard) and low flow aerator water flows, related input assumptions, and the resulting water savings. Assumptions regarding average duration of use and number of uses per day are also presented. This is based on the CL&P and UI savings document, which itself relied on FEMP assumptions.[397]

[397] Federal Energy Management Program "Domestic Water Conservation Technologies" at www1.eere.energy.gov/femp/pdfs/22799.pdf and other sources.

Variable	Value	Notes
Standard aerator	2.2 GPM	
Replacement low flow aerator	1.5 GPM	
Savings in GPM	0.7 GPM	
Duration of use (minutes)	0.5	
No. of uses/day	30	
Days/year	260	
Gallons of water saved/year	2,730	

Typical value for water temperature leaving the faucet is 80 °F, by location:

City	Annual average outdoor temperature (°F)	T main (°F)
Albany	48.2	54.2
Binghamton	46.9	52.9
Buffalo	48.3	54.3
Massena	44.7	50.7
Syracuse	48.6	54.6
Upstate average	47.3	53.3
Long Island	56.5	62.5
NYC	56.5	55.0

Coincidence Factor
The recommended value for the coincidence factor is 0.8

SHOWERHEAD – LOW FLOW

Measure Description

A low flow showerhead is a water saving showerhead with rated gallons per minute (gpm) less than maximum allowable flowrate as mandated by federal, state and regional code. New York City plumbing code and New York State construction code dictate a maximum flowrate of 2.0 gpm for showerheads. This is a retrofit direct install measure or a new installation.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times H_2O_{savings} \times (T_{shower} - T_{main}) \times \frac{8.33}{3{,}412} \times \frac{1}{RE_{elec}}$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = units \times H_2O_{savings} \times (T_{shower} - T_{main}) \times \frac{8.33}{100{,}000} \times \frac{1}{RE_{gas}}$$

Note: to estimate the annual gallons of water saved from installation of measure

$$H_2O_{savings} = (GPM_{baseline} - GPM_{ee}) \times Throttle_{fac} \times \frac{minutes}{use} \times \frac{uses}{day} \times 365\,\frac{days}{yr}$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
$H_2O_{savings}$	= Reduction of hot water usage per facility per year
units	= Number of measures installed under the program
$_{baseline}$	= Baseline condition or measure
$_{ee}$	= Energy efficient condition or measure
GPM	= Gallons per minute
RE	= Recovery efficiency of water heater
$Throttle_{fac}$	= Throttle factor
8.33	= Specific weight of water (lbs/gallon)
T_{shower}	= Temperature (°F) at showerhead
T_{main}	= Temperature (°F) of supply water from main
100,000	= Conversion factor, (BTU/therm), one therm equals 100,000 BTU’s
3,412	= Conversion factor, one kW equals 3,412.14 BTU/h

Summary of Variables and Data Sources

Variable	Value	Notes
ΔkWh savings		
Δtherms savings		
GPM_{ee}		Gallons per minute for energy efficient measure, from application.
$GPM_{baseline}$	2.0	Gallons per minute for baseline[398,399]
$Throttle_{fac}$	0.9	Used in LBNL study to adjust for occupant reduction in flow rate[400]
minutes/use	8.2	Average shower duration per LBNL study.[401]
uses/day		From application.
RE_{gas}	0.80	Assumed typical gas hot water heater recovery efficiency (standard efficiency)
	0.94	Assumed typical gas hot water heater recovery efficiency (ENERGY STAR® qualified)
$RE_{electric}$	0.98	Assumed typical electric hot water heater recovery efficiency.
T_{main}		Average inlet water temperature (°F) by location is shown below.
T_{shower}	105°F	Average temperature at showerhead; conservative assumption based on NYS plumbing code, EPA MFHR program and ASSE 1070-2014

Inlet water temperature from main, by location is shown below.

City	Annual average outdoor temperature	T mains (°F)
Albany	48.2	54.2
Binghamton	46.9	52.9
Buffalo	48.3	54.3
Massena	44.7	50.7
Syracuse	48.6	54.6
Upstate Average	47.3	53.3
Long Island	56.5	62.5
NYC	56.5	55.0

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A.

Low-Flow Pre-Rinse Spray Valve

Measure Description

This measure covers the retrofit of pre-rinse spray valves, often used in commercial and institutional kitchens. Pre-rinse spray valves (PRSV) are handheld devices that are designed to remove food waste from dishes prior to dishwashing. Retrofitting existing standard flow PRSVs in locations where service water is supplied by electric or natural gas fired hot water heaters with new low-flow PRSVs reduces hot water consumption resulting in corresponding energy savings.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings (Electric Water Heating Equipment Only)

$$\Delta kWh = units \times \frac{(GPM_{baseline} - GPM_{ee}) \times 60 \times hrs \times \Delta T_{main} \times 8.33}{3{,}412} \times \frac{1}{Eff_{elec}}$$

Peak Coincident Electrical Demand Savings (Electric Water Heating Equipment Only)

$$\Delta kW = N/A$$

Annual Gas Energy Savings (Gas Water Heating Equipment Only)

$$\Delta therms = units \times \frac{(GPM_{baseline} - GPM_{ee}) \times 60 \times hrs \times \Delta T_{main} \times 8.33}{100{,}000} \times \frac{1}{Eff_{gas}}$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
baseline	= Baseline condition or measure
ee	= Energy efficient condition or measure
GPM	= Gallons per minute
hrs	= Annual operating hours of PRSV
ΔT_{main}	= Average temperature difference between PRSV operating temperature and the supply water temperature in water main (°F)
Eff	= Water heating process efficiency
8.33	= Energy required (BTU) to heat one gallon of water by one degree Fahrenheit
3,412	= Conversion factor, one kWh equals 3,412 BTU
100,000	= Conversion factor (BTU/therm), one therm equals 100,000 BTU
60	= Minutes in one hour

Summary of Variables and Data Sources

Variable	Value	Notes
$GPM_{baseline}$	≤ 5.0 ozf: 1.00 > 5.0 and ≤ 8.0 ozf: 1.20 > 8.0 ozf: 1.28	Current federal standard based on spray force product class in ounce-force, ofz.[403] For municipalities subject to EPA WaterSense (i.e., WaterSense Partners), maximum standard flowrate under that program supersede federal standard values.
GPM_{ee}		From application.
hrs		Lookup in operating hours table below based on facility type. If unknown, use 365 as default
ΔT_{main}	$T_{PRSV} - T_{main}$	Average temperature difference between PRSV operating temperature and the supply water temperature in water main (°F).
T_{PRSV}		PRSV operating temperature (°F), from application. If unknown, assume 120°F.[404]
T_{main}		Supply water temperature in water main (°F). Lookup in Cold Water Inlet Temperature table below based on nearest city.
Eff_{elec}	0.90	Process efficiency of electric water heater.[405] The temperature differential is derived from the average main temperature and the operating temperature at the PRSV. Therefore, process efficiency of delivery of hot water to the PRSV, rather than rated water heater efficiency, is used.
Eff_{gas}	0.60	Process efficiency of gas water heater.[406] The temperature differential is derived from the average main temperature and the operating temperature at the PRSV. Therefore, process efficiency of delivery of hot water to the PRSV, rather than rated water heater efficiency, is used.

Cold Water Inlet Temperature (T_{main})

Supply water main temperatures vary according to climate and are approximately equal to the annual average outdoor temperature plus 6°F.[407] Supply main temperatures based on the annual outdoor temperature are shown below.

City	Annual average outdoor temperature[408] (°F)	Average Main Temperature T_{main} (°F)
Albany	48.3	54.3
Binghamton	46.3	52.3
Buffalo	48.3	54.3
Massena	43.5	49.5
NYC	55.4	61.4
Poughkeepsie	49.8	55.8
Syracuse	48.3	54.3

Coincidence Factor (CF)

The recommended coincidence factor for this measure is N/A.

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a PRSV as defined in the Measure Description section above with flow rate equivalent to current federal standard. For municipalities subject to EPA WaterSense (i.e., WaterSense Partners), maximum standard flowrate under that program supersede federal standard values.

Compliance Efficiency from which Incentives are Calculated

The compliance condition is a PRSV as defined in the Measure Description section above meeting minimum performance requirements dictated by program eligibility criteria.

Operating Hours

Annual operating hours of pre-rinse spray valves based on facility type are listed in the table below.[409]

Type of Facility	hrs (Hours/Year)
Quick-Service Restaurant	365
Casual Dining Restaurant	730
Cafeteria	1460

Heating, Ventilation and Air Conditioning (HVAC)

Air Conditioner and Heat Pump - Refrigerant Charge Correction

Measure Description

Correcting refrigerant charge on air conditioners and heat pumps in small commercial applications.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Energy Savings

$$\Delta kWh = units \times (tons/units) \times [(12 / SEER_{uncorr}) - 12 / SEER_{corr})] \times EFLH_{cooling}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times (tons/units) \times [(12 / EER_{uncorr.pk}) - (12 / EER_{corr,\ pk})] \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

Δ kWh	= Annual electric energy savings
Δ kW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
SEER	= Seasonal energy efficiency ratio in BTU/watt-hour. Total cooling output of an air conditioner during its normal annual usage period for cooling, in BTU/h, divided by the total electric energy input during the same period, in watt-hours
EER	= Energy efficiency ratio, measurement of cooling capacity for a unit (in BTU/hour) / electrical energy used (watts) at a specific temperature of (95°F)
$EFLH_{cooling}$	= Cooling equivalent full-load hours
CF	= Coincidence factor
12	= kBTUh/ton of air conditioning capacity
tons/unit	= Tons of air conditioning per unit, based on nameplate data
$_{pk}$	= Peak
$_{corr}$	= Corrected
$_{uncorr}$	= Uncorrected

Summary of Variables and Data Sources

Variable	Value	Notes
$EER_{pk,\ uncorr}$	$0.9 \times EER_{pk,\ corr}$	Recommended value
$SEER_{uncorr}$	$0.9 \times SEER_{corr}$	Recommended value

Coincidence Factor (CF)

Recommended value for the coincidence factor is 0.8

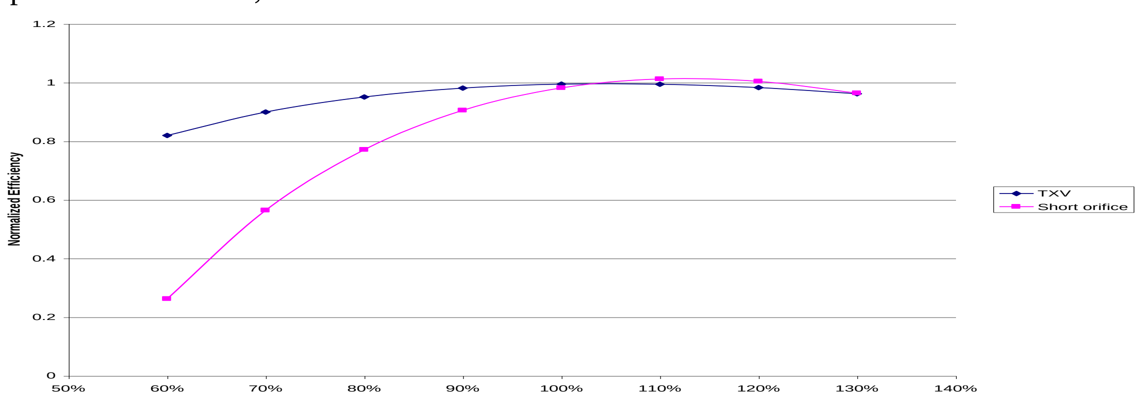
Baseline Efficiencies from which Savings are Calculated

The baseline (uncorrected) efficiency is adjusted relative to the nominal (corrected) unit efficiency based on the recorded charge adjustment and the graph above. Use a 0.9 adjustment factor if charge adjustment amount not known.

Efficiency assumptions for properly charged air conditioners and heat pumps in several size classes are shown below.

Equipment Category	Capacity Range (BTU/hr)	Baseline Efficiency	
		Average	
Unitary A/C (1) phase	<65,000 1 phase	13.0 SEER	Unitary A/C (1) phase
Unitary A/C (3) phase	<65,000 3 phase	13.0 SEER	Unitary A/C (3) phase
Unitary A/C (3) phase	65,000 - 135,000	11.2 IEER	Unitary A/C (3) phase
Unitary A/C (3) phase	135,000 - 240,000	11.0 IEER	Unitary A/C (3) phase
Unitary A/C (3) phase	240,000 - 760,000	9.9 IEER	Unitary A/C (3) phase
Unitary A/C (3) phase	>760,000	9.6 IEER	Unitary A/C (3) phase
Unitary HP (1) phase	<65,000 1 phase	13.0 IEER	Unitary HP (1) phase
Unitary HP (3) phase	<65,000 3 phase	13.0 IEER	Unitary HP (3) phase
Unitary HP (3) phase	65,000 - 135,000	11.0 IEER	Unitary HP (3) phase
Unitary HP (3) phase	135,000 - 240,000	10.5 IEER	Unitary HP (3) phase
Unitary HP (3) phase	240,000 - 760,000	9.4 IEER	Unitary HP (3) phase

Efficiency impacts are proportional to the magnitude of the charge adjustment. When data are collected in the field that records the charge adjustment amount as a percentage of the factory charge, use the graph below to determine the efficiency impact. Note the efficiency change depends on the type of expansion valve. Use the curve labeled TXV for units with thermal expansion valves, otherwise use the curve labeled short orifice.



If the magnitude of the charge adjustment is not known, a default value of 10% improvement in unit efficiency is recommended. That is, the efficiency of an uncorrected unit is 10% below that of a corrected unit.

Compliance Efficiency from which Incentives are Calculated

Charge corrected to manufacturers' specifications, restoring unit to nameplate efficiency.

Operating Hours

The operating hours by climate zone and building type are shown in Appendix G.

UNITARY AIR CONDITIONER AND UNITARY & APPLIED HEAT PUMP

Measure Description

This measure covers installation of high-efficiency unitary air conditioners and unitary and applied heat pumps in commercial applications. The baseline case shall be minimally code compliant equipment of the same type and capacity as in the proposed case, which shall be sized in accordance with federal, state and local energy conservation code.

Unitary Air Conditioner

One or more factory-made assemblies, which normally include a cooling coil, an air moving device, a compressor(s) and condenser combination, and may include a heating function as well. The functions of commercial and industrial Unitary Air Conditioners, either alone or in combination with a heating plant, are to provide air circulation, cooling, and dehumidification, and may include the functions of heating, humidifying, outdoor air ventilation, and air cleaning.[410]

Unitary and Applied Heat Pump

One or more factory-made assemblies, which normally include an indoor conditioning coil, an air moving device, compressor(s), and an outdoor coil(s), including means to provide a heating function and may or may not include a cooling function. Such equipment may be provided in one assembly by a single manufacturer (unitary) or separate assemblies designed to be used together (applied). Commercial and industrial unitary and applied heat pumps shall provide the function of heating and may include the function of air circulation, air cooling, dehumidifying or humidifying, outdoor air ventilation, and air cleaning.[411]

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

For Units with Cooling Capacity <65,000 Btu/h

$$\Delta kWh = units \times \begin{bmatrix} \left(\frac{tons}{unit} \times \left(\frac{12}{SEER_{baseline}} - \frac{12}{SEER_{ee}}\right) \times EFLH_{cooling}\right) \\ + \\ \left(\frac{kBTUh}{unit} \times \left(\frac{1}{HSPF_{baseline}} - \frac{1}{HSPF_{ee}}\right) \times EFLH_{heating}\right) \end{bmatrix}$$

For Units with Cooling Capacity ≥65,000 Btu/h

$$\Delta kWh = units \times \begin{bmatrix} \left(\frac{tons}{unit} \times \left(\frac{12}{IEER_{baseline}} - \frac{12}{IEER_{ee}}\right) \times EFLH_{cooling}\right) \\ + \\ \left(\frac{kBTUh/unit}{3.412} \times \left(\frac{1}{COP_{baseline}} - \frac{1}{COP_{ee}}\right) \times EFLH_{heating}\right) \end{bmatrix}$$

[410] AHRI Standard 340/360 – 2015 & AHRI Standard 210/240 with Addenda 1 and 2 – 2012
[411] Ibid.

Peak Coincident Demand Savings

$$\Delta kW = units \times \left[\left(\frac{tons}{unit} \times \left(\frac{12}{EER_{baseline}} - \frac{12}{EER_{ee}}\right) \times CF_{cooling}\right)\right]$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
tons	= Output cooling capacity in tons (at AHRI standard rating conditions)
kBtuh	= Output heating capacity in kBTU/h (at AHRI standard high-temperature rating conditions)
baseline	= Baseline condition or measure
ee	= Energy efficient condition or measure
SEER	= Seasonal energy efficiency ratio in BTU/watt-hour. Total cooling output of an air conditioner during its normal annual usage period for cooling in BTU, divided by the total electric energy input during the same period in watt-hours (used only for units with cooling capacity <65,000 BTU/h).
IEER	= Integrated energy efficiency ratio in BTU/watt-hour. A weighted calculation of mechanical cooling efficiencies at full load and part load AHRI standard rating conditions (used only for units with cooling capacity ≥65,000 BTU/h)[412]
EER	= Energy efficiency ratio under peak conditions in BTU/watt-hour. Measurement of the cooling capacity for a unit in BTU/hr divided by the connected electric power of the unit in watts (at AHRI standard rating conditions)
HSPF	= Heating seasonal performance factor, total heating output (supply heat) in BTU (including electric strip heat) during the heating season divided by the total electric energy heat pump consumed in watt-hours (used only for units with cooling capacity <65,000 BTU/h)
COP	= Coefficient of performance, ratio of output energy/input energy (at AHRI standard high-temperature rating conditions) (used only for units with cooling capacity ≥65,000 BTU/h)
$EFLH_{cooling}$	= Cooling equivalent full-load hours
$EFLH_{heating}$	= Heating equivalent full-load hours
CF	= Coincidence factor
12	= kBTUh/ton of air conditioning capacity
3.412	= Conversion factor, one watt/h equals 3.412142 BTU

[412] AHRI Standard 340/360 – 2015 & AHRI Standard 210/240 with Addenda 1 and 2 – 2012

Summary of Variables and Data Sources

Variable	Value	Notes
tons		From application
kBTUh		From application
$SEER_{baseline}$		Lookup from Baseline Efficiencies table below based on equipment type, size category and applicable code.
$SEER_{ee}$		From application
$HSPF_{baseline}$		Lookup from Baseline Efficiencies table below based on equipment type, size category and applicable code.
$HSPF_{ee}$		From application
$IEER_{baseline}$		Lookup from Baseline Efficiencies table below based on equipment type, size category and applicable code.
$IEER_{ee}$		From application
$COP_{baseline}$		Lookup from Baseline Efficiencies table below based on equipment type, size category and applicable code.
COP_{ee}		From application
$EER_{baseline}$		Lookup from Baseline Efficiencies table below based on equipment type, size category and applicable code.
EER_{ee}		From application
$EFLH_{heating}$		From application. If unknown, lookup based on building type and location from Appendix G.
$EFLH_{cooling}$		From application. If unknown, lookup based on building type and location from Appendix G.
CF	0.8	

The **SEER** is an estimate of the seasonal energy efficiency for an average US city for small units <65,000 BTUh cooling output.

The **EER** is the rated full-load efficiency of the unit. It is used to estimate the efficiency of the unit under peak summer conditions.

The **IEER** is a weighted calculation of mechanical cooling efficiencies at full load and part load AHRI Standard Rating Conditions. Larger units are rated in IEER.

The **COP** is a ratio of the heating capacity in watts to the power input value in watts at any given set of AHRI Standard Rating Conditions.

The **HSPF** is the average space heating system efficiency during the space heating season in BTU/watt-hr for small units <65,000 BTUh cooling output.

Coincidence Factor (CF)
The recommended value for the coincidence factor is 0.8.[413]

Baseline Efficiencies from which Savings are Calculated

[413] *No source specified – update pending availability and review of applicable references.*

The baseline condition is defined as minimally code compliant equipment of type and cooling and heating capacities equivalent to the proposed case. The baseline efficiencies for unitary air conditioning and unitary and applied heat pump equipment are specified in the table below, as defined by International Energy Conservation Code and subsequently adopted by the Energy Conservation Construction Code of New York State[414] (ECCCNYS), and the New York City Energy Conservation Code[415] (NYCECC). EER requirements are not specified by state or city code for equipment with <65,000 Btu/h cooling capacity. For this equipment, baseline EER are established as follows[416]:

$$EER = (1.12 \times SEER) - (0.02 \times SEER^2)$$

Resultant values from application of this equation to equipment with <65,000 Btu/h cooling capacity are tabulated in the baseline efficiencies table below.

Federal energy conservation standards[417] effective January 1, 2018 for small, large and very large package air conditioning and heating equipment supersede NYS and NYC code as indicated in the table below.

Unitary Air Conditioners					
Equipment Type	**Size Category (Cooling Capacity)**	**Heating Section Type**	**Subcategory or Rating Condition**	**Baseline Efficiency (NYS)**	**Baseline Efficiency (NYC)**
Air conditioners (air cooled)	< 65,000 Btu/h (single phase)	All	Split System	11.2 EER 13.0 SEER	11.2 EER 13.0 SEER
			Single Package	11.8 EER 14.0 SEER	11.8 EER 14.0 SEER
Through-the-wall (air cooled)	≤ 30,000 Btu/h (single phase)	All	Split System	10.6 EER 12.0 SEER	10.6 EER 12.0 SEER
			Single Package	10.6 EER 12.0 SEER	10.6 EER 12.0 SEER
Small-duct high-velocity (air cooled)	< 65,000 Btu/h (single phase)	All	Split System	9.9 EER 11.0 SEER	9.9 EER 11.0 SEER

			17ºF db/15ºF wb Outdoor Air	2.05 COP	2.05 COP

Compliance Efficiency from which Incentives are Calculated
The compliance condition is a high efficiency unitary air conditioning or unitary/applied heat pump system as defined in the Measure Description section above meeting minimum performance requirements dictated by program eligibility criteria.

Operating Hours
Equipment heating and cooling equivalent full load hours shall be taken from the application. If unknown, default EFLH by facility type and location can be found in Appendix G.

Effective Useful Life (EUL)

CHILLER – AIR AND WATER COOLED

Measure Description

This measure applies to constant and variable speed electric air-cooled and water-cooled chillers in commercial buildings with built-up HVAC systems.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times tons/unit \times (IPLV_{baseline} - IPLV_{ee}) \times EFLH_{cooling}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times tons/unit \times (FL_{baseline} - FL_{ee}) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
tons/unit = Tons of air conditioning per unit, based on nameplate data
$_{baseline}$ = Baseline condition or measure
$_{ee}$ = Energy efficient condition or measure
IPLV = Integrated part-load value (in kW/Ton)
FL = Full-load chiller efficiency under peak conditions
EFLH = Equivalent full-load hours
CF = Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
tons		From application
$FL_{baseline}$		Full-load efficiency of baseline chiller under peak conditions, lookup based on chiller type and size from Baseline Efficiencies tables below. Use Path A values for constant speed chillers and Path B values for variable speed chillers (based on proposed case).
FL_{ee}		Full-load efficiency of energy efficiency chiller, from application.
$IPLV_{baseline}$		Integrated part-load value (kW/ton) of baseline chiller, lookup based on chiller type and size from Baseline Efficiencies tables below. Use Path A values for constant speed chillers and Path B values for variable speed chillers (based on proposed case).

Variable	Value	Notes
$IPLV_{ee}$		Integrated part-load value (kW/ton) for energy efficient measure, from application.
3.517		Conversion factor, one ton equals 3.516853 kilowatts.
$EFLH_{cooling}$		Cooling equivalent full-load hours, lookup by city, building type and HVAC type from Appendix G.
CF	0.8	

The rated full-load kW/ton (***FL***) at AHRI rating conditions is used to define the efficiency under peak conditions. The ***IPLV*** as defined by AHRI is used to define the annual average efficiency. Note, chiller full-load efficiency or IPLV may also be expressed as coefficient of performance (COP). To convert chiller efficiency from COP to kW/ton, use the following equation:
kW/ton = 3.517 / COP.

Coincidence Factor (CF)
Recommended value for the coincidence factor is 0.8. [421]

Baseline Efficiencies from which Savings are Calculated
The baseline full load and IPLV kW/Ton values listed in the tables below, per the 2016 Energy Conservation Construction Code of New York State[422] and 2016 New York City Energy Conservation Code[423], shall be used. Path A values shall be used for proposed constant speed chillers and Path B values for proposed variable speed chillers.

	≥ 600 Tons	0.585	0.380	0.585	0.380

Compliance Efficiency from which Incentives are Calculated
Compliance efficiency requirements shall be dictated by program eligibility criteria.

Operating Hours
Cooling equivalent full-load hours (EFLH) were calculated from a DOE-2.2 simulation of prototypical large office building. The prototype building characteristics are described in Appendix A. The $EFLH_{cooling}$ for built-up HVAC systems in commercial buildings by climate zone and building type are shown in Appendix G.

CHILLER - COOLING TOWER

Measure Description

This measure covers the installation of close approach cooling towers applied to water-cooled chillers used for space cooling. Consumption and peak coincident demand savings are achieved through the installation of an over-sized cooling tower designed to provide an approach of ≤ 6°F at standard rating conditions. This measure addresses approach temperature only, which is defined as the difference between the cold water temperature (cooling tower outlet) and ambient wet bulb temperature. Changes in condenser water set point control strategies are not included.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times tons \times (\Delta kWh/ton)$$

Peak Coincident Demand Savings

$$\Delta kW = units \times tons \times (\Delta kW/ton) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
units = Number of measures installed under the program
tons = Size of cooling system (in tons) being retrofitted with a close approach tower
(ΔkWh/ton) = Annual electric energy savings per ton of cooling
(ΔkW/ton) = Electric demand savings per ton of cooling
CF = Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
tons		From application
(ΔkWh/ton)		Annual electric energy savings per ton of cooling system retrofitted with close approach tower. Look up in Appendix J based on building type, HVAC type and location.
(ΔkW/ton)		Electric demand savings per ton of cooling system retrofitted with close approach tower. Look up in Appendix J based on building type, HVAC type and location
CF	0.8	

Unit energy savings were calculated from a DOE-2.2 simulation of commercial buildings with built-up HVAC systems. The prototype building characteristics are described in Appendix A. The unit energy savings by building type across different cities in NY are shown in Appendix J.

Coincidence Factor (CF)
The recommended value for the coincidence factor is 0.8.[425]

Baseline Efficiencies from which Savings are Calculated
The baseline condition is a standard cooling tower with a 10°F approach temperature under standard rating conditions.

Compliance Efficiency from which Incentives are Calculated
The compliance condition is a close approach cooling tower with a 6°F approach temperature under standard rating conditions.

Operating Hours
The HVAC system operating hours vary by building type. Operating hour assumptions for the prototypical building models are described in Appendix A.

Effective Useful Life (EUL)

CHILLER SYSTEM TUNE-UPS

Measure Description

Chiller system tune-ups are conducted to ensure equipment is operating at optimal performance and are performed as preventative maintenance, extending the life of the equipment. The tune-ups improve the efficiency and performance of the chillers and are useful system checks to ensure maintenance is performed to keep the equipment operating. Testing and maintenance conducted as part of a typical chiller tune-up include: checking and cleaning evaporator and condenser coils/tubes, checking and replacing filters, belts, and contactors, checking cooling towers for buildup/scale, checking control operation and setpoints, checking crankcase heater operation and checking economizer function.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times \frac{tons}{unit} \times (IPLV_{baseline} \times ESF) \times EFLH_{cooling}$$

Peak Coincident Demand Savings

$$\Delta kW = units \times \frac{tons}{unit} \times \left(kW/ton_{baseline} \times DSF\right) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of chillers addressed under the program
tons/unit	= Tons of air conditioning per chiller, based on nameplate data
$EFLH_{cooling}$	= Equivalent full-load cooling hours
CF	= Coincidence factor
$IPLV_{baseline}$	= Integrated part-load value (kW/ton)
$kW/ton_{baseline}$	= Full load chiller efficiency under peak conditions
ESF	= Energy savings factor
DSF	= Demand savings factor

Summary of Variables and Data Sources

Variable	Value	Notes
$IPLV_{baseline}$	Variable	Based on nameplate data, if available. Otherwise, use values from Baseline Efficiency table below.
$kW/ton_{baseline}$	Variable	Based on nameplate data, if available. Otherwise, use values from Baseline Efficiency table below.
ESF	5%[426]	Energy Savings Factor (efficiency recovered from tune-up)
DSF	2.5%[427]	Demand Savings Factor (efficiency recovered from tune-up)
$EFLH_{cooling}$	Lookup	Cooling equivalent full-load hours by building type, Appendix G.
CF	0.8	Coincidence Factor

Coincidence Factor (CF)
Recommended value for the coincidence factor is 0.8.

Baseline Efficiencies from which Savings are Calculated
The baseline full load and IPLV kW/Ton values shall be based on actual manufacturers' catalog for the existing chiller, where available. If this information is unavailable, the efficiencies listed in the table below, per the 2016 Energy Conservation Construction Code of New York State[428] and 2016 New York City Energy Conservation Code[429], shall be used.

Equipment Type	Size Category	ECCCNYS Maximum Full Load (kW/Ton)	ECCCNYS Maximum IPLV (kW/Ton)	NYCECC Maximum Full Load (kW/Ton)	NYCECC Maximum IPLV (kW/Ton)
Air-Cooled Chillers	< 150 Tons	1.188	0.876	1.188	0.876
	≥ 150 Tons	1.188	0.857	1.188	0.857
Water-Cooled, Positive Displacement	< 75 Tons	0.750	0.600	0.750	0.600
	≥ 75 Tons and < 150 Tons	0.720	0.560	0.720	0.560
	≥ 150 Tons and < 300 Tons	0.660	0.540	0.660	0.540
	≥ 300 Tons and < 600 Tons	0.610	0.520	0.610	0.520
	≥ 600 Tons	0.560	0.500	0.560	0.500

426 US DOE: Hospitals Benefit by Improving Inefficient Chiller Systems, August 2011
427 Conservative estimate based on engineering judgement, estimated at half of the established 5% energy savings factor
428 ECCCNYS 2016, Table C403.2.3(7)
429 NYCECC 2016; Table C403.2.3(7)

Equipment Type	Size Category	ECCCNYS Maximum Full Load (kW/Ton)	ECCCNYS Maximum IPLV (kW/Ton)	NYCECC Maximum Full Load (kW/Ton)	NYCECC Maximum IPLV (kW/Ton)
Water Cooled, Centrifugal	< 150 Tons	0.610	0.550	0.610	0.550
	≥ 150 Tons and < 300 Tons	0.610	0.550	0.610	0.550
	≥ 300 Tons and < 400 Tons	0.560	0.520	0.560	0.520
	≥ 400 Tons and < 600 Tons	0.560	0.500	0.560	0.500
	≥ 600 Tons	0.560	0.500	0.560	0.500

Compliance Efficiency from which Incentives are Calculated
Compliance for incentive eligibility will be dictated by minimum tune-up standards of the applicable program.

Operating Hours
Reference Appendix G for applicable value for specific building use type and geographic location.

Effective Useful Life (EUL)
Years: 5
Source: 2013 Wisconsin PSC EUL Database

References

1. United States Department of Energy, Building Technologies Program: Hospitals Benefit by Improving Inefficient Chiller Systems, August 2011. The paper found that dirty coils can cause a 7% reduction in cooling capacity. Therefore, coil cleaning, the primary savings mechanism associated with this tune-up measure, is conservatively assumed to save 5% of total consumption. Demand savings are conservatively assumed to be half of this, or 2.5%.

DUCT - SEALING AND INSULATION

Measure Description

Improvements to duct systems made separately or in conjunction with high efficiency rooftop AC or heat pump and/or furnace installation. Duct systems are assumed to be located in an unconditioned plenum space between insulated finished ceiling and roof surface.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times \left[\frac{ton}{unit} \times \frac{12}{SEER} \times EFLH_{cooling} \times \left[1 - \frac{\bar{\eta}_{dist,baseline}}{\bar{\eta}_{dist,ee}}\right]_{cooling} + \frac{kBTUh_{out}}{unit} \times \frac{EFLH_{heating}}{HSPF} \times \left[1 - \frac{\bar{\eta}_{dist,baseline}}{\bar{\eta}_{dist,ee}}\right]_{heating} \right]$$

Peak Coincident Demand savings

$$\Delta kW = units \times tons/unit \times \frac{12}{EER_{pk}} \times \left[1 - \frac{\eta_{dist,pk,base}}{\eta_{dist,pk,ee}}\right] \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times \frac{kBTUh_{in}}{unit} \times \frac{EFLH_{heating}}{100} \times \left[1 - \frac{\bar{\eta}_{dist,baseline}}{\bar{\eta}_{dist,ee}}\right]_{heating}$$

where:

Δ kWh	= Annual electric energy savings
Δ kW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
kBTUh	= Annual gas input rating
kBTUh	= Annual Gas output rating
baseline	= Baseline condition or measure
ee	= Energy efficient condition or measure
in	= Input
out	= Output
pk	= Peak
dist	= Distribution
cooling	= Cooling system
heating	= Heating system

tons/unit = Tons of air conditioning per unit, based on nameplate data

SEER = Seasonal average energy efficiency ratio over the cooling season, BTU/watt-hour, (used for average U.S. location/region)

EER_{pk} = Energy efficiency ratio under peak conditions

HSPF = Heating seasonal performance factor, total heating output (supply heat) in BTU (including electric heat) during the heating season / total electric energy heat pump consumed (in watt/hr)

$\bar{\eta}$ = Average energy efficiency (0 -100%)

η = Energy efficiency (0 -100%)

EFLH = Equivalent full-load hours

CF = Coincidence factor

100 = Conversion factor, (kBTUh/therm)

Summary of Variables and Data Sources

Variable	Value	Notes
tons		From application
SEER	10	Existing unit
	13	New construction
$\bar{\eta}_{dist, baseline}$		Value for 30% leakage by building type and location. Use measured leakage if available
$\bar{\eta}_{dist, ee}$		Measured leakage OK if available; otherwise assume 15% in existing systems and 6% in new construction. Use appropriate R-value if duct insulation is also included.
$EFLH_{cooling}$		Vintage weighted average by city.
$EER_{baseline}$	9.2	existing unit
	11.1	new unit
$\eta_{dist, baseline}$	$\bar{\eta}_{dist, baseline}$	
$\eta_{dist, ee}$	$\bar{\eta}_{dist, ee}$	
If heat pump:		
$kBTUh/unit_{out}$		From application
HSPF	6.8	existing unit
	8.1	new unit
If furnace		
$kBTUh_{in}/unit$		From application
$\bar{\eta}_{dist, baseline}$		Value for 30% leakage by building type and location. Use measured leakage if available
$\bar{\eta}_{dist, ee}$		Measured leakage OK if available; otherwise assume 15% in existing systems and 6% in new construction. Use appropriate R-value if duct insulation is also included.
$EFLH_{heating}$		Vintage weighted average by city.

The SEER is an estimate of the seasonal energy efficiency for an average US city. The $\mathbf{EER_{pk}}$ is an estimate of the efficiency of the unit under peak summer conditions. See the section on packaged air conditioners for more information.

The HSPF is an estimate of the seasonal heating energy efficiency for an average US city. See section on air source heat pumps above for more information.

The ***average seasonal efficiency*** of the furnace is the ratio of the heating output to the fuel input (in consistent units) over a heating season. See section on furnaces for more information.

The ***duct system efficiency*** accounts for losses from duct systems due to leakage and inadequate insulation. Duct system efficiencies were calculated for duct systems located in unconditioned plenum space between an insulated finished ceiling and roof surface in commercial building with packaged rooftop HVAC systems are shown in Appendix H.

Coincidence Factor (CF)
The recommended value for the coincidence factor is 0.8

Baseline Efficiencies from which Savings are Calculated
The baseline efficiency for air conditioners, heat pumps and/or furnaces should be set to according to the sections on this equipment above. Distribution system efficiency ($\overline{\eta}_{\text{dist, baseline}}$) should be set as follows:

Overall baseline duct leakage is assumed to be 30%, based on work done by Modera and Proctor on small commercial buildings in California. The baseline duct system is assumed to be uninsulated.

Compliance Efficiency from which Incentives are Calculated
The measure efficiency ($\overline{\eta}_{\text{ee}}$) for air conditioners, heat pumps and/or furnaces should be set according to the sections on this equipment above. The improved duct system efficiency ($\overline{\eta}_{\text{dist, ee}}$) should be set assuming 15% total leakage in existing construction and 8% total leakage in new construction, with R-6 duct insulation.

Operating Hours
Heating equivalent full-load hours calculated from building energy simulation models described in Appendix A and summarized in Appendix G.

Economizer – Air Side, with Dual Enthalpy Control

Measure Description

This measure covers the installation of dual enthalpy control air-side economizers integrated into a central air handling system on packaged rooftop units. Air-side economizers reduce mechanical cooling requirements by supplying outside air to the space when the outside air meets conditions deemed suitable for cooling. Dual enthalpy control, often called differential enthalpy control, augments this functionality by measuring sensible and latent heat of both the outside air and return air, using dampers to supply the conditioning section of the air handler with the lowest enthalpy air supply. This measure applies to retrofit scenarios for small commercial applications only. This measure also only applies in cases where economizers are not required by state, federal, or local code.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times tons/unit \times (\Delta kWh/ton)$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
tons/unit	= Tons of air conditioning per unit, based on nameplate data
(ΔkWh/ton)	= Annual electric energy savings per ton of cooling

Summary of Variables and Data Sources

Variable	Value	Notes
tons/unit		From application
(ΔkWh/ton)		Lookup based on building type and location in the Air Side Economizer table in Appendix J.

Unit energy savings were calculated from a DOE-2.2 simulation of a series of prototypical small commercial buildings. The prototype building characteristics are described in Appendix A. The unit energy savings by building type and city are shown in Appendix J.

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a packaged rooftop unit with no economizer installed.

Compliance Efficiency from which Incentives are Calculated
The compliance condition is a packaged rooftop unit with dual enthalpy economizer installed and commissioned to ensure proper operation.

Operating Hours
HVAC system operating hours are embedded into the deemed savings shown in Appendix J and vary by building type. See Appendix A for details on prototype building simulation parameters.

Furnace and Boiler

Measure Description

This measure covers high-efficiency gas-fired furnaces, boilers and unit heaters used for space heating installed in all buildings except low-rise residential (single and multifamily) applications. The baseline case shall be minimally code compliant equipment of the same type and capacity as in the proposed case, which shall be sized in accordance with federal, state and local energy conservation code.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = N/A$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = units \times \left(\frac{kBTUh_{in}}{unit}\right) \times \left(\frac{\eta_{ee}}{\eta_{baseline}} - 1\right) \times \left(\frac{EFLH_{heating}}{100}\right)$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
$kBTUh_{in}$ = Fuel input rating of the proposed equipment
$_{baseline}$ = Baseline condition or measure
$_{ee}$ = Energy efficient condition or measure
η = Energy efficiency (0-100%)
$EFLH_{heating}$ = Heating equivalent full-load hours
100 = Conversion factor, one therm equals 100 kBTU

Summary of Variables and Data Sources

Variable	Value	Notes
$kBTUh_{in}$/unit		Nameplate input rating of the proposed unit, from application.
$\eta_{baseline}$		Baseline established by applicable energy conservation code, climatic zone, equipment type and size, fuel source, and system configuration. See Baseline Efficiency section below.
η_{ee}		From application.
$EFLH_{heating}$		From application. If unknown, lookup based on building type and location from Appendix G.

Efficiency is expressed as the ratio of the fuel input relative to the output heating capacity. The efficiency of furnaces, boilers and unit heaters is customarily evaluated on the basis of one or more of three standards, namely Thermal Efficiency (E_t), Combustion Efficiency, (E_c) and Annual Fuel Utilization Efficiency (AFUE).

Presently, the AFUE value is only applicable to smaller units (<300 kBTUh for boilers and <225 kBTUh for furnaces). For larger units, use thermal and combustion efficiencies referenced on manufacturer's nameplate data in accordance with nationally recognized standards and testing agencies.

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A.

Baseline Efficiencies From Which Savings are Calculated

The baseline condition is a minimally code compliant system of type and capacity equivalent to the proposed condition. The baseline efficiency for commercial furnaces, boilers, and unit heaters ($\eta_{baseline}$) is defined by the Code of Federal Regulations (CFR) and subsequently adopted by the Energy Conservation Construction Code of New York State[430] and the New York City Energy Conservation Code[431] as shown below.

Equipment Type	Size Range	ECCCNYS Minimum Efficiency for Climate Zones 4, 5 and 6	NYCECC Minimum Efficiency for NYC Boroughs in Climate Zone 4
Warm Air Furnace, Gas Fired	< 225 kBTU/h	78% AFUE or 80% E_t	78% AFUE or 80% E_t
	≥ 225 kBTU/h	80% E_t	80% E_t
Warm Air Unit Heaters, Gas Fired	All Capacities	80% E_c	80% E_c
Boiler, Hot Water, Gas Fired	< 300 kBTU/h	80% AFUE	80% AFUE
	≥ 300 kBTU/h and ≤ 2,500 kBTU/h	80% E_t	80% E_t
	> 2,500 kBTU/h	82% E_c	82% E_c
Boiler, Steam, Gas Fired, All Except Natural Draft	< 300 kBTU/h	75% AFUE	75% AFUE
	≥ 300 kBTU/h and ≤ 2,500 kBTU/h	79% E_t	79% E_t
	> 2,500 kBTU/h	79% E_t	79% E_t
Boiler, Steam, Gas Fired, Natural Draft	< 300 kBTU/h	75% AFUE	75% AFUE
	≥ 300 kBTU/h and ≤ 2,500 kBTU/h	77% E_t	77% E_t
	> 2,500 kBTU/h	77% E_t	77% E_t

[431] NYCECC 2016; Table C403.2.3(4) and Table C403.2.3(5)

Compliance Efficiencies From Which Incentives are Calculated

The compliance condition is a gas-fired furnace, boiler or unit heater used for space heating as defined in the Measure Description section above meeting minimum performance requirements dictated by program eligibility criteria.

Operating Hours

Heating equivalent full-load hours were calculated from a DOE-2.2 simulation of prototypical commercial buildings. Operating hour assumptions for the prototypical building models are described in Appendix A. The heating EFLH for commercial buildings in NY are shown in Appendix G.

Effective Useful Life (EUL)

See Appendix P.

Ancillary Fossil Fuel Savings Impacts

N/A

Ancillary Electric Savings Impacts

High efficiency furnaces may be packaged with high efficiency cooling equipment and/or electronically commutated blower motors, which may provide electricity savings. Draft fans, when present, will increase electricity consumption. These ancillary impacts are not included in the savings estimation approach detailed above.

<u>BOILER TUNE-UP</u>

Measure Description

This measure applies to gas-fired hot water and steam boilers used for process loads or space heating not covered under 40 CFR Part 63 Subpart 6J[432]. Tune-up will improve boiler efficiency by cleaning burners, combustion chamber and burner nozzles, adjusting air flow and reducing excessive stack temperatures, adjusting burner and gas input and checking venting, safety controls, and adequacy of combustion air intake. Combustion efficiency must be measured before and after tune-up using a flue gas analyzer.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = N/A$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta Therms = units \times \frac{kBTUh_{in}/unit}{100 \times LF} \times \left(1 - \frac{E_{c,baseline}}{E_{c,ee}}\right) \times EFLH_{heating}$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of boilers addressed under the program
$kBTU_{in}$/unit	= Fuel input rating per boiler, based on nameplate data
$EFLH_{heating}$	= Equivalent full-load heating hours
LF	= Load Factor
100	= Conversion factor, (kBTU/Therm)
$E_{c,baseline}$	= Baseline combustion efficiency as determined via flue gas analysis
$E_{c,ee}$	= Post-implementation combustion efficiency as determined via flue gas analysis

[432] 40 CFR 63 Subpart JJJJJJ: https://www.ecfr.gov/cgi-bin/text-idx?node=sp40.15.63.jjjjjj

Summary of Variables and Data Sources

Variable	Value	Notes
$kBTUh_{in}$/unit	Nameplate	Nominal heating input capacity is the nameplate input rating of the unit in kBTU/ hr, from application.
LF	1.3	Assumes 30% boiler oversizing[433]
$E_{c,baseline}$	Measured	Efficiency as measured in pre-tune-up inspection
$E_{c,ee}$	Measured	Post-tune-up efficiency as measured post-tune-up
$EFLH_{heating}$	Lookup	For space heat; lookup based on building type and location, Appendix G. For process heat use hours of operation from application

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A.

Baseline Efficiencies from which Savings are Calculated

The baseline efficiency is the combustion efficiency of the boiler measured during pre-tune-up inspection via flue gas analysis.

Compliance Efficiency from which Incentives are Calculated

The compliance efficiency is the combustion efficiency of the boiler measured after tune-up via flue gas analysis.

Operating Hours

Heating equivalent full-load hours were calculated from a DOE-2.2 simulation of prototypical small commercial buildings. Operating hour assumptions for the prototypical building models are described in Appendix A. The heating EFLH for commercial buildings in NY are shown in Appendix G.

STEAM TRAP REPAIR OR REPLACEMENT – LOW PRESSURE SPACE HEATING

Measure Description

Steam systems distribute heat from boilers to satisfy space heating, process, and commercial end-use requirements. Steam distribution systems contain steam traps, which are automatic valves that remove condensate, air, and other non-condensable gases, while preventing or minimizing steam loss. Steam traps that fail may allow excess steam to escape, thus increasing the amount of steam that must be generated to meet end-use requirements. This measure and calculations are applicable to steam traps served by gas fired boilers, for low-pressure (<15 psig) space heating. This measure does not apply to municipal steam systems.

All traps are susceptible to wear and dirt contamination and require periodic inspection and maintenance to insure correct operation. Faulty steam traps (leaking or blow-through) can be diagnosed with ultrasonic, temperature, or conductivity monitoring techniques. Regular steam trap maintenance and faulty steam trap replacement are steps that minimize steam production. There are three major types of steam traps that are applicable: 1) thermostatic (including float and thermostatic), 2) mechanical and 3) thermodynamic.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = N/A$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = Loss_{steam} \times \frac{H_v}{E_t} \times \frac{EFLH_{heating}}{100{,}000}$$

$$Loss_{steam} = 24.24 \times Dia^2 \times P_a \times 50\%$$

$$P_a = psig + psia$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
$Loss_{steam}$	= Hourly steam loss per failed trap (lb/hr)
24.24	= Steam loss constant per Napier's equation (lb/hr-psia-in^2)
Dia	= Internal Diameter (I.D.) of steam trap orifice
P_a	= Absolute steam pressure (psi)

50% = Percent of orifice open[435]
psig = Steam gage pressure (psi)
psia = Atmospheric pressure (psi)
H_v = Heat of vaporization (latent heat), in Btu/lb
E_t = Thermal efficiency of boiler
$EFLH_{heating}$ = Equivalent full-load heating hours
100,000 = Conversion from Btu to therms (100,000 Btu/therm)

Summary of Variables and Data Sources

Variable	Value	Notes
$Loss_{steam}$	Calculated	Dependent upon system operating pressure (psig) and steam trap orifice diameter (D)
D	Variable	Steam trap orifice diameter (in), from application
P_a	Calculated	Dependent upon system operating pressure (psig)
psig	Variable	Steam boiler operating pressure (psi), from application
psia	14.7	Atmospheric pressure (psi)
H_v	Lookup	Lookup from table below based on system operating pressure (psig)
E_t	Variable	Boiler thermal efficiency, from application
$EFLH_{heating}$	Lookup	Lookup based on building type and location in Appendix G.

Heat of Vaporization (Btu/lb)[436]

Pressure (psig)	Heat of Vaporization (Btu/lb)

[435] Conservative estimate typically used by steam trap manufacturers/vendors to estimate savings; Enbridge adjustment factor used as referenced in CLEAResult "Work Paper Steam Traps Revision #2" Revision 3 dated March 2, 2012 and DOE Federal Energy Management Program Steam Trap Performance Assessment.
[436] Thermodynamic Properties of Steam Including Data for the Liquid and Solid Phases (1936)

Coincidence Factor (CF)
The recommended value for the coincidence factor is N/A.

Baseline Efficiencies from which Savings are Calculated
The baseline is assumed to be a steam trap failed open on a low-pressure steam space heating system.

Compliance Efficiency from which Incentives are Calculated
Replaced or repaired traps will no longer leak or blow-through after installation.

Operating Hours
Heating equivalent full-load hours were calculated from a DOE-2.2 simulation of prototypical small commercial buildings. Operating hour assumptions for the prototypical building models are described in Appendix A. The heating EFLH for commercial buildings in NY are shown in Appendix G.

[437] CA DEER – 2014 Updated EUL Records

AIR CONDITIONER AND HEAT PUMP – PACKAGED TERMINAL

Measure Description

This measure covers installation of high efficiency unitary air conditioners and unitary and applied heat pumps in commercial applications. The baseline case shall be minimally code compliant equipment of the same type and capacity as in the proposed case, which shall be sized in accordance with federal, state and local energy conservation code.

Packaged Terminal Air Conditioner (PTAC)

A wall sleeve and a separate un-encased combination of heating and cooling assemblies specified by the manufacturer and intended for mounting through the wall. It includes refrigeration components, separable outdoor louvres, forced ventilation, and heating availability by purchaser's choice of, at least, hot water, steam, or electrical resistance heat.

Note: *Models designated as "cooling only" units need not include heating elements if the physical characteristics and arrangement of the refrigeration system are identical to those of models with heating availability.*[438]

Packaged Terminal Heat Pump (PTHP)

A separate un-encased refrigeration system installed in a cabinet having a function and configuration similar to that of a packaged terminal air-conditioner. It uses reverse cycle refrigeration as its prime heat source and should have other supplementary heat source(s) available to purchasers with the choice of, at least, hot water, steam, or electric resistance heat.[439,440]

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times \left[\begin{array}{c} \left(\frac{kBTUh_{cooling}}{unit} \times \left(\frac{1}{EER_{baseline}} - \frac{1}{EER_{ee}}\right) \times EFLH_{cooling}\right) \\ + \\ \left(\frac{kBTUh_{heating}}{unit \times 3.412} \times \left(\frac{1}{COP_{baseline}} - \frac{1}{COP_{ee}}\right) \times EFLH_{heating}\right) \end{array}\right]$$

Peak Coincident Demand Savings

$$\Delta kW = units \times \left[\left(\frac{kBTUh_{cooling}}{unit} \times \left(\frac{1}{EER_{baseline}} - \frac{1}{EER_{ee}}\right) \times CF\right)\right]$$

438 AHRI Standard 310/380 – 2014

439 Ibid.

440 Replacement unit shall be factory labeled as follows: "MANUFACTURED FOR REPLACEMENT APPLICATIONS ONLY: NOT TO BE INSTALLED IN NEW CONSTRUCTION PROJECTS." Replacement efficiencies apply only to units with existing sleeves less than 16 inches (406 mm) in height and less than 42 inches (1067 mm) in width.

Annual Gas Energy Savings

$$\Delta therm = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
$kBTUh_{cooling}$ = Output cooling capacity in kBTU/h (at AHRI standard rating conditions)
$kBTUh_{heating}$ = Output heating capacity in kBTU/h (at AHRI standard high-temperature rating conditions)
EER = Energy efficiency ratio, measurement of cooling capacity for a unit (in BTU/hour) / electrical energy used (watts) (at AHRI standard rating conditions)
COP = Coefficient of performance, ratio of output energy/input energy (at AHRI standard high-temperature rating conditions)
$EFLH_{cooling}$ = Cooling equivalent full-load hours
$EFLH_{heating}$ = Heating equivalent full-load hours
3.412 = Conversion factor, one watt/h equals 3.412142 BTU
CF = Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
$kBTUh_{cooling}$		From application
$kBTUh_{heating}$		From application
$COP_{baseline}$		Calculate from Baseline Efficiencies table below based on equipment type, size category and capacity.
COP_{ee}		From application
$EER_{baseline}$		Calculate from Baseline Efficiencies table below based on equipment type, size category and capacity.
EER_{ee}		From application
$EFLH_{heating}$		From application. If unknown, lookup based on building type and location from Appendix G.
$EFLH_{cooling}$		From application. If unknown, lookup based on building type and location from Appendix G.
CF	0.8	

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.8.[441]

Baseline Efficiencies from which Savings are Calculated

The baseline condition is defined as minimally code compliant equipment of type and cooling

[441] *No source specified – update pending availability and review of applicable references.*

and heating capacities equivalent to the proposed case. The baseline efficiencies are calculated based on rated equipment input capacity in BTU/h and are defined by International Energy Conservation Code[442] and subsequently adopted by the Energy Conservation Construction Code of New York State (ECCCNYS) and the New York City Energy Conservation Code[443] (NYCECC) as shown below. The formulas in the rightmost column shall be used to establish the baseline efficiency in the units specified (EER or COP).

Equipment Type	Size Category (Input)	Subcategory or Rating Condition	Minimum Efficiency ECCCNYS and NYCECC[444]
PTAC (Cooling Mode) Standard Size	All Capacities	95°F db Outdoor Air	EER = 14.0 - (0.300 × Cap/1000)
PTAC (Cooling Mode) Replacements/ Nonstandard Size[445]	All Capacities	95°F db Outdoor Air	EER = 10.9 - (0.213 × Cap/1000)
PTHP (Cooling Mode) Standard Size	All Capacities	95°F db Outdoor Air	EER = 14.0 - (0.300 × Cap/1000)
PTHP (Cooling Mode) Replacements/ Nonstandard Size	All Capacities	95°F db Outdoor Air	EER = 10.8 - (0.213 × Cap/1000)
PTHP (Heating Mode) Standard Size	All Capacities	—	NY State: COP = 3.2 – (0.026 × Cap/1000) NYC: COP = 3.7 – (0.052 × Cap/1000)
PTHP (Heating Mode) Replacements/ Nonstandard Size	All Capacities	—	COP = 2.9 - (0.026 × Cap/1000)

Compliance Efficiency from which Incentives are Calculated
The compliance condition is a high efficiency packaged terminal air conditioner or heat pump system as defined in the Measure Description section above meeting minimum performance requirements dictated by program eligibility criteria.

---

[442] ECCCNYS 2016, Table C403.2.3(3)
[443] NYCECC 2016, Table C403.2.3(3)
[444] "Cap" = The rated cooling capacity of the project in BTU/h. If the unit's capacity is less than 7,000 BTU/h, use 7,000 BTU/h in the calculation. If the unit's capacity is greater than 15,000 BTU/h, use 15,000 BTU/h in the calculations."
[445] Replacement/Nonstandard size units must be factory labeled as follows: "MANUFACTURED FOR REPLACEMENT APPLICATIONS ONLY; NOT TO BE INSTALLED IN NEW CONSTRUCTION PROJECTS." Replacement/Nonstandard size efficiencies apply only to units being installed in existing sleeves having an external wall opening of less than 16 in. high or less than 42 in. wide and having a cross-sectional area less than 670 in.

Operating Hours
Equipment heating and cooling equivalent full load hours shall be taken from the application. If unknown, default EFLH by facility type and location can be found in Appendix G.

HEATING, VENTILATION AND AIR CONDITIONING (HVAC) – CONTROL

THERMOSTAT - PROGRAMMABLE SETBACK (NON-COMMUNICATING)

Measure Description

This section covers programmable setback thermostats (non-communicating) applied to air conditioners, heat pumps and/or furnaces and boilers in small commercial buildings.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times (tons/unit \times \left(\frac{12}{SEER}\right) \times EFLH_{cooling} \times ESF_{cooling}) + (\left(\frac{kBTUh_{out}}{unit}\right) \times \left(\frac{EFLH_{heating}}{HSPF}\right) \times ESF_{heating})$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = units \times \left(\frac{kBTUh_{in}}{unit}\right) \times \frac{EFLH_{heating}}{100} \times ESF_{heating}$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
CF	= Coincidence factor
tons/unit	= Tons of air conditioning per unit, based on nameplate data
heating	= Heating system
cooling	= Cooling system
out	= Output capacity
in	= Input capacity
12	= kBTUh/ton of air conditioning capacity
ESF	= Energy savings factor
SEER	= Seasonal average energy efficiency ratio over the cooling season, BTU/watt-hour, (used for average U.S. location/region)
HSPF	= Heating seasonal performance factor (BTU/watt-hr), a measure of the seasonal average efficiency of the heat pump in the heating mode
EFLH	= Equivalent full-load hours

Summary of Variables and Data Sources

Variable	Value	Notes
tons		From application, or use 5 ton as default. Use 0 if no central cooling
$SEER_{baseline}$	10	
$EFLH_{cooling}$		Vintage weighted average by city.
$ESF_{cooling}$	0.09	
If heat pump:		
$kBTUh/unit_{out}$		The nominal rating of the heating output capacity of the heat pump in KBTU/hr (including supplemental heaters), from application
$HSPF_{baseline}$	6.8	
If furnace:		
$kBTUh_{in}/unit$		The nominal rating of the heating input capacity of furnace or boiler kBTUh, from application.
If boiler:		
$kBTUh_{in}/unit$		From application
$EFLH_{heating}$		Vintage weighted average by city.
$ESF_{heating}$	0.068	

The SEER is an estimate of the seasonal energy efficiency for an average US city. The $\mathbf{EER_{pk}}$ is an estimate of the efficiency of the unit under peak summer conditions. See the section on packaged air conditioners above for more information.

The HSPF is an estimate of the seasonal heating energy efficiency for an average US city. See section on air source heat pumps above for more information.

The ***average seasonal efficiency*** of the furnace is the ratio of the heating output to the fuel input (in consistent units) over a heating season. See section on high efficiency furnaces above for more information.

The ***nominal rating of the cooling capacity of the air conditioner or heat pump*** should set equal to the rated capacity of all cooling equipment controlled by a setback thermostat in the building.

The ***nominal rating of the heating capacity*** of the furnace should set equal to the rated input capacity of all heating equipment controlled by a setback thermostat in the commercial facility. Nameplate capacity for heat pumps should include the full output heating capacity of the heat pump system, including backup electric resistance heaters.

The ***Energy Savings Factor*** (ESF) is the ratio of the energy savings resulting from installation of a programmable setback thermostat to the annual cooling energy.

Coincidence Factor (CF)
The recommended value for the coincidence factor is N/A

Baseline Efficiencies from which Savings are Calculated

The baseline efficiency for air conditioners and heat pumps should be set to according to the sections on air conditioner and heat pump efficiency above.

Studies of residential heating thermostat set point behavior indicate some amount of manual setback adjustment in homes without programmable thermostats. This behavior is assumed to be present in the small commercial buildings addressed in this Tech Manual.

Compliance Efficiency from which Incentives are Calculated

The energy savings factor (ESF) assumption is taken from a study of programmable thermostat savings in Massachusetts conducted by GDS Associates for KeySpan Energy Delivery. The study estimated an energy savings of 3.6% of the annual heating energy consumption for programmable setback thermostats in residential applications. This assumption is also applied to the small commercial buildings addressed in this Tech Manual.

Operating Hours

Heating equivalent full-load hours calculated from building energy simulation models described in Appendix A and summarized in Appendix G.

THERMOSTAT – WI-FI (COMMUNICATING)

Measure Description

This section covers Wi-Fi communicating thermostats without behavioral learning capability applied to small commercial buildings with natural gas heat boilers or furnaces, electric heat pumps, electric resistance heating or central air conditioners. These communicating thermostats allow set point adjustment via a remote application. This measure does not apply to Wi-Fi thermostats installed as part of a Demand Response program.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings (Cooling)

$$\Delta kWh = units \times kWh/unit$$

Peak Coincident Demand Savings

$$\Delta kW = units \times kW/unit$$

Annual Gas Energy Savings

$$\Delta therms = units \times therms/unit$$

where:

ΔkWh = Annual electricity energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
kWh/unit = Annual electric savings per unit
kW/unit = Peak coincident demand savings per unit
therms/unit = Annual gas savings per unit

Summary of Variables and Data Sources

Variable	Value	Notes
kWh/unit	104	Annual electric savings per installed thermostat, in kWh[446]
kW/unit	0.23	Peak demand savings per installed thermostat, in kW[447]
therms/unit	66	Annual gas savings per installed thermostat, in therms[448]

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A.

[446] Cadmus Group, Wi-Fi Programmable Controllable Thermostat Pilot Program Evaluation, September 2012
[447] Ibid.
[448] Ibid.

Baseline Efficiencies from which Savings are Calculated

The baseline efficiency is an HVAC system using natural gas and electricity to provide space heating and cooling controlled by a non-Wi-Fi communicating programmable thermostat.

Compliance Efficiency from which Incentives are Calculated

The compliance efficiency is an HVAC system using natural gas and electricity to provide space heating and cooling controlled by a Wi-Fi communicating thermostat without behavioral learning capability. The thermostat shall not be installed as part of a Demand Response program.

Operating Hours

HVAC system operating hours are embedded in the deemed savings values associated with Wi-Fi communicating thermostats, which are based on metering results.

DEMAND CONTROL VENTILATION (DCV)

Measure Description

Demand control ventilation systems have the capability to automatically reduce the outdoor air intake below design rates when occupancy of spaces served by the system is less than design occupancy. Typically, this is controlled by a carbon dioxide sensor, occupancy sensor or turnstile counter. Demand control ventilation systems save energy by reducing the amount of outside air which requires heating or cooling.

This measure assumes a demand control ventilation system with CO_2 sensors will be added to an HVAC system with natural gas heating which previously had no DCV installed.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = \frac{SF}{1{,}000} \times ESF_{Cooling}$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = \frac{SF}{1{,}000} \times ESF_{heating}$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
SF = Total square footage of the conditioned space impacted by the measure
$ESF_{cooling}$ = Energy savings factor for cooling (kWh/1,000 ft^2)
$ESF_{heating}$ = Energy savings factor for heating (therms/1,000 ft^2)
1,000 = Conversion to 1,000 ft^2

[450]CA DEER – 2014 Updated EUL Records

LIGHTING

INTERIOR AND EXTERIOR LAMPS AND FIXTURES

Measure Description

This section covers energy-efficient lighting equipment, such as energy-efficient lamps, energy-efficient ballasts, compact fluorescent lamps, LED lamps, and improved lighting fixtures. Improved lighting fixtures may include reflectors and other optical improvements to lighting fixtures. These technologies, taken separately or combined into an energy-efficient lighting fixture, provide the required illumination at reduced input power.

Per EISA 2007, effective beginning January 1, 2020, if more stringent regulations are not put into effect by that date, the sale of general service lamps that do not meet a minimum efficiency standard of 45 lumens per watt will be prohibited.[451] Although baseline conditions for this measure are assumed to be the existing lighting wattage, this stipulation may still have a significant impact on claimable savings associated with replacement of general service lamps (20% - 70% depending on lumen output) beginning in 2020, particularly in cases where building code is triggered (new construction or renovations). This information is provided to inform future ETIP development.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = \left[\frac{(W \times units)_{baseline} - (W \times units)_{ee}}{1{,}000}\right] \times hrs_{operating} \times (1 + HVAC_c)$$

Peak Coincident Demand Savings

$$\Delta kW = \left[\frac{(W \times units)_{baseline} - (W \times units)_{ee}}{1{,}000}\right] \times (1 + HVAC_d) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = \left[\frac{(W \times units)_{baseline} - (W \times units)_{ee}}{1{,}000}\right] \times hrs_{operating} \times HVAC_g$$

New construction, space renovations or remodels may require a building permit that includes compliance with local or state energy codes. In these instances, the applicable energy code defines the baseline. The energy consumption of the efficient and baseline lighting systems are defined in terms of the lighting power density (LPD) in watts per square foot. An alternate form of the lighting equations based on LDP is as follows:

[451] Energy Independence and Security Act of 2007. Pub. L. 110-140. Sec. 321. Efficient Light Bulbs H.R.6 – 89

Annual Electric Energy Savings

$$\Delta kWh = area \times \left[\frac{LPD_{baseline} - LPD_{ee}}{1{,}000}\right] \times hrs_{operating} \times (1 + HVAC_c)$$

Peak Coincident Demand Savings

$$\Delta kW = area \times \left[\frac{LPD_{baseline} - LPD_{ee}}{1{,}000}\right] \times (1 + HVAC_d) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = area \times \left[\frac{LPD_{baseline} - LPD_{ee}}{1{,}000}\right] \times hrs_{operating} \times HVAC_g$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
CF	= Coincidence factor
$_{ee}$	= Energy efficient condition or measure
$_{baseline}$	= Baseline condition or measure
area	= Extent of space or surface
1,000	= Conversion factor, one kW equals 1,000 watts
LPD	= Lighting power density
W	= Watts
$hrs_{operating}$	= Lighting operating hours
$HVAC_c$	= HVAC interaction factor for annual electric energy consumption
$HVAC_d$	= HVAC interaction factor for peak demand at NYISO coincident summer peak hour
$HVAC_g$	= HVAC interaction factor for annual natural gas consumption (therms/kWh)

Summary of Variables and Data Sources

Variable	Value	Notes
$Units_{baseline}$		Number of baseline measures, from application. Set equal to $Units_{ee}$ if unknown.
$Units_{ee}$		Number of energy efficient measures installed under the program, from application.
$W_{baseline}$		Connected load of the baseline unit(s) displaced, from application (in Watts).
W_{ee}		Connected load of the energy-efficient unit, from application (in Watts).
$hrs_{operating}$		Lighting operating hours. From application or default, as listed below in the Operating Hours table.
$LPD_{baseline}$		Lighting power density (in W/SF) for baseline

Variable	Value	Notes
		measure, from application, based on NYS/NYC Energy Conservation code. New construction or major renovation (as defined by applicable code/permits) only.
LPD_{ee}		Lighting power density (in W/SF) for energy efficient measure, from application, based on installed system design. New construction or major renovation (as defined by applicable code/permits) only.
area		Floor area illuminated by lighting system (in SF)
$HVAC_c$	0 for Exterior and Unconditioned Space	HVAC interaction factor for annual electric energy consumption (dimensionless). Vintage and HVAC type weighted average by city. See Appendix D.
$HVAC_d$	0 for Exterior and Unconditioned Space	HVAC interaction factor for peak demand at utility summer peak hour (dimensionless). Vintage and HVAC type weighted average by city. See Appendix D.
$HVAC_g$	0 for Exterior and Unconditioned Space	HVAC interaction factor for annual natural gas energy consumption (therms/kWh). Vintage and HVAC type weighted average by city. See Appendix D.
CF	1.0 for Interior 0.0 for Exterior	"Interior" designation extends to any covered area not adequately lit during daylight hours by sunlight, thus requiring daytime operation of lighting.

HVAC system interaction factors are defined as the ratios of the cooling energy and demand reduction and heating energy increase per unit of lighting energy reduction. Much of the input energy for lighting systems is converted to heat that must be removed by the HVAC system. Reductions in lighting heat gains due to lighting power reduction decrease the need for space cooling and increase the need for space heating.

HVAC interaction factors vary by climate, HVAC system type and building type. Recommended values for HVAC interaction factors for lighting energy and peak demand savings are shown in Appendix D. Lighting systems in unconditioned spaces or on the building exterior will have interaction factors of 0.0. The building types for the HVAC interactive effect factors by facility type are shown in the lighting Operating Hours table below.

Coincidence Factor (CF)

The recommended coincidence factor for commercial indoor lighting measures is 1.0.[452] Since exterior lighting is generally off during daylight hours, the coincidence factor for exterior lighting is 0.0.

452 *No source specified – update pending availability and review of applicable references.*

Baseline Efficiencies from which Savings are Calculated

The baseline condition is assumed to be the existing and operational lighting fixture in all applications other than new construction or extensive renovations that trigger the building code. See table of standard fixture wattages in Appendix C. Note, depending on local codes, new construction, space renovations or remodels may require a building permit that includes compliance with local or state energy codes. In these instances, the applicable energy code defines the baseline.

Code LPD shall be taken from chapter C405.4: Interior Lighting Power Requirements (Prescriptive) and chapter 405.5: Exterior Lighting (Mandatory) of the Energy Conservation Construction Code of New York State [453] (ECCCNYS) and the New York City Energy Conservation Code [454] (NYCECC) that are based on IECC 2015. Alternatively, ASHRAE Standard 90.1-2013 may be referenced for compliance. In both cases, either the Building Area or Space-By-Space compliance path may be used.

Compliance Efficiency from which Incentives are Calculated

Compliance efficiency and fixture/lamp specifications shall be dictated by program eligibility criteria. See table of standard fixture wattages in Appendix C. Manufacturers' cut sheets may substitute for the standard fixture watts in Appendix C if available. In new construction or major renovation projects, the new lighting system power consumption should be expressed as a lighting power density (LPD) in watts per square foot.

Operating Hours

The average lighting operating hours are defined by building type, as shown in the table below. These are typical average values for the building types shown. Use building specific operating hours where available. For exterior lighting, the default annual operating hours are 4,380 hrs/yr (12 hours per day).

Facility Type	Lighting Hours (hrs/yr)	HVAC Int	Facility Type	Lighting Hours (hrs/yr)	HVAC Int

REFRIGERATED CASE LED

Measure Description

This measure pertains to installation of horizontally or vertically-mounted LED fixtures in commercial display refrigerators, coolers or freezers. Refrigerated case lighting increases the cooling load of the refrigeration system by adding heat to the unit that must be overcome through additional cooling. Replacing fluorescent lamps with low-heat generating LEDs reduces the energy consumption associated with the lighting components and reduces the amount of waste heat generated from the lamps that must be overcome by the refrigeration system.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = \left(\frac{(W \times units)_{baseline} - (W \times units)_{ee}}{1{,}000}\right) \times hrs_{operating} \times (1 + (Comp_{eff} \times 0.284))$$

Peak Coincident Demand Savings

$$\Delta kW = \left(\frac{(W \times units)_{baseline} - (W \times units)_{ee}}{1{,}000}\right) \times CF \times (1 + (Comp_{Eff} \times 0.284))$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electricity energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
W	= Rated wattage of lamp or fixture (Watts)
baseline	= Baseline condition or measure
ee	= Energy efficient condition or measure
1,000	= Conversion factor, one kW equals 1,000 Watts
$hrs_{operating}$	= Lighting operating hours
CF	= Coincidence factor
$Comp_{Eff}$	= Efficiency of the cooler/freezer compressor (kW/Ton)
0.284	= Conversion factor from kW to Tons of refrigeration (Tons/kW)

Summary of Variables and Data Sources

Variable	Value	Notes
$W_{baseline}$		From application, or 2 times the proposed LED wattage[455]
W_{ee}		From application
$hrs_{operating}$		From application
$Comp_{Eff}$	Refrigerated Case – 1.00 Freezer Case - 1.92	Typical refrigeration system efficiency (kW/Ton)[456]
CF	0.948	Taken from RLW Analytics, Inc. Coincidence Factor study, "Grocery" facility type

Coincidence Factor (CF)
The recommended value for the coincidence factor is 0.948.[457]

Baseline Efficiencies from which Savings are Calculated
The baseline lighting wattage is the rated or deemed wattage of the existing fixture/lamp. See table of standard fixture wattages in Appendix C. If this data is not available, the baseline wattage shall be the proposed wattage multiplied by 2.

Compliance Efficiency from which Incentives are Calculated
The compliance case is a refrigerated display case with horizontally or vertically-mounted LED lighting. Compliance efficiency and fixture/lamp specifications shall be dictated by program eligibility criteria.

Operating Hours
Operating hours for refrigerated case lighting will be site-specific and taken from the application. If unavailable, refer to the "Operating Hours" section of the Commercial and Industrial Interior and Exterior Lamps and Fixtures measure for default hours of operation.

LIGHTING – CONTROL

INTERIOR LIGHTING CONTROL

Measure Description

This section covers lighting control measures, including occupancy sensors, stepped and dimming daylighting controls and programmable control systems, installed on lighting in interior spaces where these controls are not mandated by federal, state or local code. Interior spaces are defined as any covered area not adequately lit during daylight hours by sunlight, thus requiring daytime operation of lighting. These systems save energy and peak demand by shutting off power to lighting fixtures when the space is unoccupied or illumination is not required. They also save energy and demand by reducing power to lighting systems to correct for over-illumination due to excessive lamp output or the presence of daylight.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = \left(\frac{W_{ctrl}}{1{,}000}\right) \times hrs_{operating,baseline} \times ESF \times (1 + HVAC_c)$$

Peak Coincident Demand Savings

$$\Delta kW = \left(\frac{W_{ctrl}}{1{,}000}\right) \times ESF \times (1 + HVAC_d) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = \left(\frac{W_{ctrl}}{1{,}000}\right) \times hrs_{operating,baseline} \times ESF \times HVAC_g$$

where:

ΔkWh = Annual electricity energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
W_{ctrl} = Total wattage of controlled lighting (Watts)
1,000 = Conversion factor, one kW equals 1,000 Watts
$hrs_{operating}$ = Lighting operating hours
baseline = Baseline condition or measure
$HVAC_c$ = HVAC interaction factor for annual electric energy consumption
$HVAC_d$ = HVAC interaction factor for peak demand at NYISO coincident summer peak hour
$HVAC_g$ = HVAC interaction factor for annual natural gas consumption (therms/kWh)
ESF = Energy savings factor
CF = Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
W_{ctrl}		Connected load of controlled lighting fixtures (in Watts), from application
$hrs_{operating,baseline}$		Lighting operating hours. From application or see Operating Hours section below.
$HVAC_c$	0 for Unconditioned Space	HVAC interaction factor for annual electric energy consumption (dimensionless). Vintage and HVAC type weighted average by city. See Appendix D.
$HVAC_d$	0 for Unconditioned Space	HVAC interaction factor for peak demand at utility summer peak hour (dimensionless). Vintage and HVAC type weighted average by city. See Appendix D.
$HVAC_g$	0 for Unconditioned Space	HVAC interaction factor for annual natural gas energy consumption (therms/kWh). Vintage and HVAC type weighted average by city. See Appendix D.
ESF		See Energy Savings Factors table below
CF	1.0	"Interior" designation extends to any covered area not adequately lit during daylight hours by sunlight, thus requiring daytime operation of lighting.

Energy Savings Factor[459]

The ***energy savings factor*** (ESF) is the average annual reduction in electric consumption achieved by a particular control measure type. Energy savings factors for various automated lighting control types are specified in the table below.

Control Type	ESF
Occupancy Sensor	0.30
Daylight Dimming Control	0.30
Daylight Stepped Control	0.20
Programmable Control	0.15

- ***Occupancy Sensor*** – Reduces lighting operating hours by switching off lighting in unoccupied spaces.
- ***Daylight Dimming Control*** – Reduces lighting output to a set level in response to natural daylighting using continuous dimming capability.
- ***Daylight Stepped Control*** – Reduces lighting output to a set level in response to natural daylighting using stepped dimming capability.

[459] *REVIEW OF UNDERLYING REFERENCE PENDING:* ESF values derived from lighting control power adjustment factors prescribed in the California Title 24 Nonresidential Lighting Standards.

- ***Programmable Control*** – Sophisticated lighting controllers that combine many of the above functions into a single unit and may also be coupled to the building security system.

Coincidence Factor (CF)

The recommended coincidence factor for commercial indoor lighting measures is 1.0. [460]

Baseline Efficiencies from which Savings are Calculated

The baseline case for this measure is a lighting system with manual or time-switch controls. This measure is not applicable in spaces for which occupancy or daylight-responsive controls are required by federal, state or local code. Refer to chapter C405.2 Lighting Controls (Mandatory) of the Energy Conservation Construction Code of New York State[461] (ECCCNYS) and the New York City Energy Conservation Code[462] (NYCECC) for details.

Compliance Efficiency from which Incentives are Calculated

The compliance case is a lighting system with occupancy or daylight-responsive controls designed and installed in accordance with manufacturers' and/or designer recommendations. Compliance specifications shall be dictated by program eligibility criteria.

Operating Hours

The baseline lighting operating hours are the average operating hours for all fixtures subject to lighting control measures before the lighting controls are installed. This information shall be taken from the application. If unavailable, refer to the "Operating Hours" section of the Commercial and Industrial Interior and Exterior Lamps and Fixtures measure for default hours of operation.

<u>BI-LEVEL LIGHTING</u>

Measure Description

Stairwell Bi-Level lighting fixtures provide lighting to spaces that are infrequently used, such as stairwells, where a minimum level of illumination is desired when unoccupied and a higher level when occupied. These fixtures are controlled by an integral occupancy sensor and are customarily available as replacements for existing fixtures. These fixtures are available with both fluorescent and LED lamps. Light levels are adjustable from 10% to 100% of nominal light output and are also available with battery back up to provide minimally code compliant illumination for a period of ninety minutes. These fixtures, when installed as a replacement fixture, provide electrical savings without compromising safety.

Method for Calculating Annual Energy Savings and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta \text{kWh} = \text{units} \times \left[\left(\frac{W_{\text{exist}}}{1000} \times 8760\right) - \left(\left(\frac{W_{\text{oc}}}{1000} \times \text{FLH}_{\text{oc}}\right) + \left(\frac{W_{\text{un}}}{1000}\right) \times \text{FLH}_{\text{un}}\right)\right]$$

Peak Coincident Demand Savings

$$\Delta \text{kW} = \text{units} \times \left[\left(\frac{W_{\text{exist}}}{1000} - \frac{W_{\text{oc}}}{1000}\right) + \left(\frac{W_{\text{oc}} - W_{\text{un}}}{1000}\right) \times \left(\frac{\text{FLH}_{\text{un}}}{8760}\right)\right] \times \text{CF}$$

Annual Gas Energy Savings

$$\Delta \text{therms} = \text{N/A}$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed
W_{exist} = Wattage of the baseline unit
W_{oc} = Wattage of the energy efficient fixture when occupied
W_{un} = Wattage of the energy efficient fixture when unoccupied
FLH = Full Load Hours of the baseline unit
FLH_{oc} = Full Load Hours of energy efficient fixture when occupied
FLH_{un} = Full Load Hours of energy efficient fixture when unoccupied (standby)
CF = Coincidence Factor
8760 = Conversion Factor, Hours to Year

Summary of Variables and Data Source

Variables	Value	Notes
units		From application, invoices or other documentation. Equal to number of lamps installed and operating.
W_{exist}		From application, connected load of existing unit.
W_{oc}		From application, connected load of the energy efficient unit when occupied.
W_{un}		From application, connected load of the energy efficient unit when unoccupied (standby).
FLH_{oc}	438 hours	Full Load Hours of energy efficient fixture when occupied.
FLH_{un}	8,322 hours	Full Load Hours of energy efficient fixture when unoccupied (standby).

Coincidence Factor (CF)

As stairwell lighting is required for life safety at all times in accordance with regulations the coincidence factor is assumed to be 1.0.

Operating Hours

Based on market research the stairwells are occupied only 5% of the time. Therefore 95% of the time the new fixture will be in the reduced wattage mode.

Reduced Wattage

Bi-level fixture from the leading lighting manufactures produce lights that will reduce the capacity to 33% or below during the unoccupied mode, when actual fixture data is not available assume that during the unoccupied mode the rated wattage will be reduced by 50%.

Effective Useful Life (EUL)

MOTORS AND DRIVES

MOTOR REPLACEMENT

Measure Description

NEMA premium efficiency motors replacing standard efficiency motors in commercial and industrial applications.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times 0.746 \times \left[\left(\frac{hp_{baseline} \times RLF_{baseline}}{\eta_{baseline}}\right) - \left(\frac{hp_{ee} \times RLF_{ee}}{\eta_{ee}}\right)\right] \times FLH$$

Peak Coincident Demand Savings

$$\Delta kW = units \times 0.746 \times \left[\left(\frac{hp_{baseline} \times RLF_{baseline}}{\eta_{baseline}}\right) - \left(\frac{hp_{ee} \times RLF_{ee}}{\eta_{ee}}\right)\right] \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
η = Energy efficiency (0 -100%)
baseline = Baseline condition or measure
ee = Energy efficient condition or measure
hp = Horsepower
FLH = Full-load hours
RLF = Rated load factor
CF = Coincidence factor
0.746 = Conversion factor (kW/hp), 746 watts equals one electric horsepower

Summary of Variables and Data Sources

Variable	Value	Notes
$\eta_{baseline}$		Efficiency of baseline measure
η_{ee}		Efficiency of energy efficient measure
$hp_{baseline}$		Horsepower rating of baseline motor
hp_{ee}		Horsepower rating of energy efficient measure

Variable	Value	Notes
$RLF_{baseline}$		Rated load factor of baseline motor
RLF_{ee}		Rated load factor of energy efficient motor

The ***motor horsepower*** refers to the nameplate or rated power output of the motor. Motors are commonly over-sized for the loads served. An energy efficient motor with a lower nameplate horsepower rating may be installed to correct for over-sizing.

The ***rated load factor*** is the ratio of peak running load to nameplate rating of the motor. The rated load factor for the energy-efficient motor will be greater than the rated load factor of the base case motor if a smaller energy-efficient motor is used to correct for over-sizing. If a smaller motor is installed, but the shaft power requirements stay the same, the product of the rated horsepower and the rated load factor should be constant. Lower torque from efficient motors may prevent downsizing of the motor.

$$(RLF \times hp)_{baseline} = (RLF \times hp)_{ee}$$

Motor ***full-load hours*** are defined as the total annual energy consumption divided by the peak hourly demand.

$$FLH = \frac{kWh}{kW_{max}}$$

For loads that do not vary with time (i.e., a motor driving a constant load), full-load hours are simply equal to the operating hours. Efficient motors generally run at slightly higher RPM than standard motors. Unless the motor drive system is modified to correct for higher RPM operation, the power delivered by the motor may increase. The increase in power delivery may negate the effects of improved efficiency.

Coincidence Factor (CF)
The recommended value for the coincidence factor is 0.8

Baseline Efficiencies from which Savings are Calculated
Former NEMA premium efficiency motors now standard efficiency due to changes in Federal standards. See Appendix L for a list of baseline motor efficiency requirements.

Compliance Efficiency from which Incentives are Calculated
Must exceed new Federal standards.

Operating Hours

VARIABLE FREQUENCY DRIVE – FAN AND PUMP

Measure Description

This measure addresses variable frequency drives applied to fans and pumps in commercial and industrial buildings. Applications covered in this section are; AHU supply and return fans, CHW pumps, cooling tower fans, condenser water pumps and heating hot water pumps.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times hp \times (\Delta kWh/hp)$$

Peak Coincident Demand Savings

$$\Delta kW = units \times hp \times (\Delta kW/hp) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
hp	= Horsepower
(ΔkWh/hp)	= Annual electric energy savings (in kWh) per controlled motor horsepower
(ΔkW/hp)	= Electric demand savings (in kW) per controlled motor horsepower
CF	= Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
hp		Horsepower rating of motor controlled by VFD, from application
(ΔkW/hp)		Electric demand savings from VFD per horsepower of motor controlled. Lookup in Appendix K by building type and VFD application. If no deemed savings are specified, (ΔkW/hp) = 0.
(ΔkWh/hp)		Annual energy savings from VFD per horsepower of motor controlled. Lookup in Appendix K by building type, city and VFD application.
CF	0.8	

Coincidence Factor (CF)

The recommended value for the coincidence factor is 0.8. [464]

[464] *No source specified – update pending availability and review of applicable references.*

Baseline Efficiencies from which Savings are Calculated

The baseline system characteristics by application are as follows:

- Chilled water and hot water pumps:
    - Variable volume, constant speed secondary pumping system
        - Existing pump rides pump curve as flow varies
- Supply fans:
    - VAV system with inlet vane control
- Return fans:
    - VAV system with discharge damper control
- Cooling tower fans:
    - One speed constant volume fan
- Condenser water pumps:
    - Constant speed, constant flow condenser water pumps

Compliance Efficiency from which Incentives are Calculated

The compliance system characteristics by application are as follows:

- Chilled water and hot water pumps:
    - Variable volume, variable speed secondary pumping system
- Supply fans:
    - VAV system with VFD control
- Return fans:
    - VAV system with VFD control
- Cooling tower fans:
    - Variable speed fans controlling condenser water temperature to 85°F
- Condenser water pumps:
    - Variable speed, variable flow condenser water loop

Operating Hours

The annual energy savings from VFD per horsepower of motor controlled (ΔkWh/hp) defined in Appendix K incorporate operating hours consideration.

ELECTRONICALLY CONTROLLED BRUSHLESS PERMANENT MAGNET (BPM) MOTORS FOR HVAC CIRCULATION (BLOWER) FAN

Measure Description

Electronically Controlled Brushless Permanent Magnet Motors, also commonly referred to as electronically commutated motors provide increased efficiency by using a micro-processor to obtain variable speed response and improve both efficiency and reliability by means of eliminating friction attributable to brushes. While such technology has been available for some time and available to a wide variety of applications such motors are now being widely adopted by HVAC equipment manufacturers and contractors as a substitute for existing permanent-split capacitor motors. This measure addresses the specific application of BPM motors on a retro-fit basis for circulating fans of one Horsepower (HP) or less in HVAC air distribution equipment employing heating and/or cooling.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta \mathrm{kWh} = \Delta \mathrm{kWh}_{\mathrm{heat}} + \Delta \mathrm{kWh}_{\mathrm{cool}}$$

Electric Energy Savings during Cooling Season

$$\mathrm{kWh}_{\mathrm{cool}} = \frac{(\mathrm{W}_{\mathrm{psc}} \times \Delta \mathrm{W}_{\mathrm{cool}})}{1000} \times \mathrm{LF} \times \mathrm{EFLH}_{\mathrm{cool}} \times (1 + \mathrm{HVAC}_{\mathrm{c}})$$

Electric Energy Savings during Heating Season

$$\Delta \mathrm{kWh}_{\mathrm{heat}} = \frac{(\mathrm{W}_{\mathrm{psc}} \times \Delta \mathrm{W}_{\mathrm{heat}})}{1000} \times \mathrm{LF} \times \mathrm{EFLH}_{\mathrm{heat}} \times (1 + \mathrm{HVAC}_{\mathrm{c}})$$

Peak Coincident Demand Savings

$$\Delta \mathrm{kW}_{\mathrm{cool}} = \frac{(\mathrm{W}_{\mathrm{psc}} \times \Delta \mathrm{W}_{\mathrm{cool}})}{1000} \times \mathrm{LF} \times \mathrm{CF} \times (1 + \mathrm{HVAC}_{\mathrm{d}})$$

where:

ΔkWh = Annual electric energy savings
ΔkWh_{cool} = Electric energy savings during cooling season
ΔkWh_{heat} = Electric energy savings during heating season
ΔkW_{cool} = Peak coincident demand savings
W_{psc} = Baseline PSC motor wattage

ΔW_{heat} = Energy efficient BPM motor wattage percentage savings, heating season[1]
ΔW_{cool} = Energy efficient BPM motor wattage percentage savings, cooling season[1]
LF = Motor load factor
CF = Coincidence factor
$EFLH_{heat}$ = Equivalent full load hours during heating season
$EFLH_{cool}$ = Equivalent full load hours during cooling season
$HVAC_c$ = HVAC interactive effects multipliers for annual electric energy consumption
$HVAC_d$ = HVAC interactive effects multipliers at summer utility peak hour

Summary of Variables and Data Sources

Variable	Value	Notes
W_{psc}	# Watts	Baseline PSC Motor Wattage Nameplate Data or Default Motor Wattage Value Table
ΔW_{heat}	23%	Energy Efficient BPM Motor Wattage Percentage Savings During Heating Season
ΔW_{cool}	38%	Energy Efficient BPM Motor Wattage Percentage Savings During Cooling Season
LF	0.9	Default Value
CF	0.8	Default Value
$EFLH_{heat}$	# Hours	Appendix G: Equivalent Full Load Hours
$EFLH_{cool}$	# Hours	Appendix G: Equivalent Full Load Hours
$HVAC_c$	#	Appendix D: HVAC Interactive Effects
$HVAC_d$	#	Appendix D: HVAC Interactive Effects Multipliers at Summer Utility Peak Hour
HP	#	Motor Rated Horsepower

Circulation Fan Default Motor Wattage Value Table

Motor Type	Motor Category (Default Output Watts)				
	1/6 HP	1/4 HP	1/3 HP	½ HP	3/4 HP
PSC Motor	311	403	460	713	1150

Coincidence Factor (CF)

The recommended coincidence factor for this measure is 0.8 consistent with all commercial air conditioning applications.

Baseline Efficiencies from which Savings are Calculated
The baseline condition is a standard efficiency PSC motor.

Compliance Efficiency from which Incentives are Calculated
The measure is defined as a BPM motor of equivalent HP.

Operating Hours

REFRIGERATION

AIR-COOLED REFRIGERATION CONDENSER

Measure Description

This measure covers the installation of efficient, close approach remote air-cooled refrigeration system condensers typically found in supermarkets. An approach temperature of 8°F or less for low temperature systems and 13°F for medium temperature systems is required. Additionally, condenser efficiency must be greater than or equal to 85 BTU/hr of heat rejection capacity per watt of fan power. Savings are derived from the reduction in condensing temperatures and improved efficiency of the condenser fan system.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times tons/unit \times (\Delta kWh/ton)$$

Peak Coincident Demand Savings

$$\Delta kW = units \times tons/unit \times (\Delta kW/ton) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of measures installed under the program
tons/unit = Tons of refrigeration per unit, based on compressor nameplate
(ΔkWh/ton) = Annual electric energy savings per ton of compressor capacity
(ΔkW/ton) = Electric demand savings per ton of compressor capacity
CF = Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
tons/unit		From application.
(ΔkWh/ton)		Look up based on city from Energy and Demand Savings table below.
(ΔkW/ton)		Look up based on city from Energy and Demand Savings table below.

Energy and Demand Savings

Unit energy and demand savings were calculated from a DOE-2.2 simulation of a prototypical grocery store. The prototype building characteristics are described in Appendix A. The unit energy and demand savings for seven different cities in NY are shown below.

City	(ΔkWh/ton)	(ΔkW/ton)
Albany	1,296	0.136
Binghamton	1,290	0.143
Buffalo	1,297	0.103
Massena	1,301	0.123
NYC	1,220	0.152
Poughkeepsie	1,258	0.144
Syracuse	1,283	0.149

Coincidence Factor (CF)
The recommended value for the coincidence factor is 1.0.[466]

Baseline Efficiencies from which Savings are Calculated
The baseline condition is assumed to be a standard efficiency air-cooled refrigeration system condenser, with a 15ºF approach temperature on low temperature applications and a 20ºF approach temperature on medium temperature applications. The baseline condition assumes a standard efficiency of 45 BTU/hr of heat rejection capacity per watt of fan power.[467]

Compliance Efficiency from which Incentives are Calculated
The compliance condition is an efficient air-cooled refrigeration system condenser, with an approach temperature of 8ºF or less on low temperature applications and an approach temperature of 13ºF or less on medium temperature applications. Condenser efficiency must be greater than or equal to 85 BTU/hr of heat rejection capacity per watt of fan power. [468]

Operating Hours
Refrigeration equipment is assumed to be available for operation 8,760 hours per year.

Effective Useful Life (EUL)

FAN MOTOR – WITH ELECTRONICALLY COMMUTATED (EC) MOTOR, FOR REFRIGERATED CASE OR WALK-IN COOLER

Measure Description

This measure covers replacement of shaded pole or permanent split evaporator fan motors with electronically commutated (EC) motors in walk-in and reach-in refrigerated cases. These high-efficiency motors achieve savings by reducing evaporator fan power and through interactive effects with the system's compressor. EC motors introduce less waste heat into the refrigerated case, reducing the total cooling load.

Method for Calculating Annual Energy and Peak Coincident Demand Savings for Walk-In Coolers/Freezers

Annual Electric Energy Savings

$$\Delta kWh = \Delta kWh_{EFan} + \Delta kWh_{RH}$$

$$\Delta kWh_{EFan} = units \times \left(\frac{A_{EFan} \times V_{EFan} \times \sqrt{Phase_{EFan}}}{1{,}000}\right) \times F_{PA} \times F_{EFan} \times hrs_{EFan}$$

$$\Delta kWh_{RH} = \Delta kWh_{EFan} \times Comp_{Eff} \times 0.284$$

Peak Coincident Demand Savings

$$\Delta kW = \Delta kW_{EFan} + \Delta kW_{RH}$$

$$\Delta kW_{EFan} = units \times \left(\frac{A_{EFan} \times V_{EFan} \times \sqrt{Phase_{EFan}}}{1{,}000}\right) \times F_{PA} \times F_{EFan} \times CF$$

$$\Delta kW_{RH} = \Delta kW_{EFan} \times Comp_{Eff} \times 0.284$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
ΔkWh_{EFan}	= Annual electric savings due to evaporator fan motor replacement
ΔkWh_{RH}	= Annual electric savings due to reduced heat from evaporator fan motor replacement
ΔkW_{EFan}	= Peak coincident demand savings due to evaporator fan motor replacement
ΔkW_{RH}	= Peak coincident demand savings due to reduced heat from evaporator fan motor replacement
units	= Number of measures installed under the program
A_{EFan}	= Nameplate amperage of existing evaporator fan motor

V_{EFan} = Nameplate voltage of existing evaporator fan motor
$Phase_{EFan}$ = Phase of existing evaporator fan
1,000 = Conversion factor, one kW equals 1,000 W
F_{PA} = Power adjustment factor
F_{EFan} = Reduction of load by replacing evaporator fan motor
hrs_{EFan} = Evaporator fan annual operating hours
$Comp_{Eff}$ = Efficiency of the cooler/freezer compressor (kW/Ton)
0.284 = Conversion factor from kW to Tons of refrigeration (Tons/kW)
CF = Coincidence factor

Method for Calculating Annual Energy and Peak Coincident Demand Savings for Refrigerated Cases

Annual Electric Energy Savings

$$\Delta kWh = \Delta kWh_{CM} + \Delta kWh_{RH}$$

$$\Delta kWh_{CM} = units \times kVA_{CM} \times F_{CM} \times hrs_{CM}$$

$$\Delta kWh_{RH} = \Delta kWh_{CM} \times Comp_{Eff} \times 0.284$$

Peak Coincident Demand Savings

$$\Delta kW = \Delta kW_{CM} + \Delta kW_{RH}$$

$$\Delta kW_{CM} = units \times kVA_{CM} \times F_{CM} \times CF$$

$$\Delta kW_{RH} = \Delta kW_{CM} \times Comp_{Eff} \times 0.284$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
ΔkWh_{CM} = Annual electric savings due to case motor replacement
ΔkWh_{RH} = Annual electric savings due to reduced heat from case motor replacement
ΔkW_{CM} = Peak coincident demand savings due to case motor replacement
ΔkW_{RH} = Peak coincident demand savings due to reduced heat from case motor replacement
units = Number of measures installed under the program
kVA_{CM} = Metered load of existing case motor
F_{CM} = Reduction of load by replacing case motor
hrs_{CM} = Case motor annual operating hours
$Comp_{Eff}$ = Efficiency of the cooler/freezer compressor (kW/Ton)

0.284 = Conversion factor from kW to Tons of refrigeration (Tons/kW)
CF = Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes
A_{EFan}		From application
V_{EFan}		From application
$Phase_{EFan}$		From application
F_{PA}	0.55	Based on experience of National Resource Management (NRM) [469]
hrs_{EF}	Cooler Control – 5,600 No Cooler Control - 8,760	Based on experience of NRM[470]
hrs_{CM}	8,500	Based on experience of NRM[471]
F_{EFan}	0.65	Based on numerous pre and post meter readings conducted by NRM and supported by RLW Analytics evaluation.[472]
F_{CM}	Shaded Pole – 0.53 PSC – 0.29	If a shaded pole motor is being replaced, use 0.53. If a PSC motor is being replaced, use 0.29. Based on numerous pre and post meter readings conducted by NRM.[473]
$Comp_{Eff}$	Refrigerated Case – 1.00 Freezer Case - 1.92	Typical refrigeration system efficiency (kW/Ton)[474]
CF	1.0	

Coincidence Factor (CF)
The recommended value for the coincidence factor is 1.0. [475]

Baseline Efficiencies from which Savings are Calculated
The baseline case is a walk-in cooler/freezer or refrigerated display case with shaded pole or permanent split capacitor (PSC) evaporator fan motors.

Compliance Efficiency from which Incentives are Calculated
The compliance case is a walk-in cooler/freezer or refrigerated display case with electronically commutated (EC) evaporator fan motors.

REFRIGERATED CASE NIGHT COVER

Measure Description

This measure covers the installation of retractable curtains on open horizontal or multi-deck refrigerated display cases in grocery stores. These covers serve as a barrier between the contents of the refrigerated case and the ambient air during off-business hours. They conserve energy by reducing the infiltration of ambient air into the refrigerated space, thereby reducing the load on the refrigeration system. Grocery stores operating 24 hours per day are not eligible for savings claims.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times TDEC \times ESF \times 365$$

Peak Coincident Demand Savings

$$\Delta kW = N/A$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of display cases addressed by the program
TDEC = Total Daily Energy Consumption (kWh/day)
ESF = Energy savings factor
365 = Days in one year

Summary of Variables and Data Sources

Variable	Value	Notes
TDEC		Total Daily Energy Consumption (kWh/day), calculate based on Total Display Area (TDA) from table below
ESF	0.09	Energy savings factor associated with installation of refrigerated case night covers[477]

Coincidence Factor (CF)

Energy savings associated with installation of refrigerated case night covers occur during off-peak hours, so no coincident peak demand savings are deemed for this measure.

[477] Southern California Edison, Effects of the Low Emissivity Shields on Performance and Power Use of a Refrigerated Display Case, August 1997

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a vertical or horizontal open refrigerated display case left uncovered during off-business hours and meeting the minimum federal energy standards presented in the tables below.[478] Equipment with an operating temperature above 32°F is classified as Medium with a rating temperature of 38°F, while equipment with an operating temperature of 32°F or below is classified as Low with a rating temperature of 0°F. Ice Cream freezers have a rating temperature of -15°F and operate at temperatures below -5°F.

Total Daily Energy Consumption (TDEC) shall be calculated per the table below for the appropriate display case type, configuration and rating temperature. For refrigeration equipment with two or more compartments (i.e. hybrid refrigerators, freezers, refrigerator-freezers and non-hybrid refrigerator freezers), the TDEC shall be established as the sum of the TDEC values associated with each component compartment. Total Display Area (TDA), if unspecified by the manufacturer, should be calculated as:

$$TDA = L \times H$$

where:

TDA = Total display area of the open case (ft^2)
L = Length of the display case opening (ft)
H = Height (vertical) or Depth (horizontal) of the display case opening (ft)

Baseline Efficiencies for Refrigerators, Freezers, or Refrigerator-freezers manufactured on or after March 27, 2017

Equipment Family	Condensing Unit Configuration	Rating Temperature	TDEC (kWh/day)
Vertical Open	Remote Condensing	Medium (38°F)	0.64 x TDA + 4.07
Vertical Open	Remote Condensing	Low (0°F)	2.20 x TDA + 6.85
Vertical Open	Remote Condensing	Ice Cream (-15°F)	2.79 x TDA + 8.70
Vertical Open	Self-Contained	Medium (38°F)	1.69 x TDA + 4.71
Vertical Open	Self-Contained	Low (0°F)	4.25 x TDA + 11.82
Vertical Open	Self-Contained	Ice Cream (-15°F)	5.40 x TDA + 15.02
Horizontal Open	Remote Condensing	Medium (38°F)	0.35 x TDA + 2.88
Horizontal Open	Remote Condensing	Low (0°F)	0.55 x TDA + 6.88
Horizontal Open	Remote Condensing	Ice Cream (-15°F)	0.70 x TDA + 8.74
Horizontal Open	Self-Contained	Medium (38°F)	0.72 x TDA + 5.55
Horizontal Open	Self-Contained	Low (0°F)	1.90 x TDA + 7.08
Horizontal Open	Self-Contained	Ice Cream (-15°F)	2.42 x TDA + 9.00

[478] 10 CFR 431.66(e)(1)

Baseline Efficiencies for Refrigerators, Freezers, and Refrigerator-freezers manufactured before March 27, 2017

Equipment Family	Condensing Unit Configuration	Rating Temperature	TDEC (kWh/day)
Vertical Open	Remote Condensing	Medium (38°F)	0.82 × TDA + 4.07
Vertical Open	Remote Condensing	Low (0°F)	2.27 × TDA + 6.85
Vertical Open	Remote Condensing	Ice Cream (-15°F)	2.89 × TDA + 8.7
Vertical Open	Self-Contained	Medium (38°F)	1.74 × TDA + 4.71
Vertical Open	Self-Contained	Low (0°F)	4.37 × TDA + 11.82
Vertical Open	Self-Contained	Ice Cream (-15°F)	5.55 × TDA + 15.02
Horizontal Open	Remote Condensing	Medium (38°F)	0.35 × TDA + 2.88
Horizontal Open	Remote Condensing	Low (0°F)	0.57 × TDA + 6.88
Horizontal Open	Remote Condensing	Ice Cream (-15°F)	2.44 × TDA + 9.00
Horizontal Open	Self-Contained	Medium (38°F)	0.77 × TDA + 5.55
Horizontal Open	Self-Contained	Low (0°F)	1.92 × TDA + 7.08
Horizontal Open	Self-Contained	Ice Cream (-15°F)	2.44 × TDA + 9.00

Compliance Efficiency from which Incentives are Calculated

The compliance condition is a vertical or horizontal open refrigerated display case with retractable night covers installed.

Operating Hours

Energy savings are based on installation of refrigerated case night covers in an 18-hour[479] supermarket assumed to operate 365 days per year. Therefore, the annual hours that night covers are assumed to be in use are (24 – 18) x 365 = 2,190 hours.

Effective Useful Life (EUL)

See Appendix P.

Ancillary Fossil Fuel Savings Impacts

Reduction in heat transfer between the refrigerated case and the ambient air will result in a small reduction in space heating requirements. This impact is negligible and occurs only during unoccupied hours, so is not considered in this methodology.

Ancillary Electric Savings Impacts

Reduction in heat transfer between the refrigerated case and the ambient air will result in a small reduction in space heating requirements and a small increase in cooling requirements. This impact is negligible and occurs only during unoccupied hours, so is not considered in this methodology.

FREEZER AND COOLER DOOR STRIP

Measure Description

This measure covers the repair or replacement of existing damaged or missing strip curtains on walk-in freezers and coolers with a chilled storage area of less than 3000ft^2.[480] Strip curtains on both walk-in freezers (≤ 32°F) and walk-in coolers (> 32°F and ≤ 55°F) serve to prevent air infiltration during periods when the main door is open for routine stocking activity. When damaged or missing, the warmer, more humid air present in the store will infiltrate the unit, increasing the load of the refrigeration system and often reducing the efficiency of the evaporator unit as frost accumulates, impairing its effectiveness. This measure applies to strip curtains on the main door of walk-in units typical of supermarkets, convenience stores and restaurants.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times SF_{door} \times (\Delta kWh/SF)$$

Peak Coincident Demand Savings

$$\Delta kW = SF_{door} \times \frac{(\Delta kWh/SF)}{hrs} \times \mathrm{CF}$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
SF_{door} = Area of cooler or freezer door opening, in square feet
(ΔkWh/SF) = Annual electric energy savings per square foot of door opening
hrs = Annual cooler or freezer operating hours per year
CF = Coincidence Factor

Summary of Variables and Data Sources

Variable	Value	Notes
SF_{door}		From application.
ΔkWh/SF		Look up in Deemed Savings table below based on case type and application.
hrs		Lookup from table in Operating Hours section below based on case type and application.
CF	1.0	

480 10 CFR 431.302

Deemed Savings (ΔkWh/SF)[481]

Case Type	Application	ΔkWh/SF
Cooler (> 32°F)	Supermarket	159
	Restaurant	18
	Convenience Store	14
Freezer (≤ 32 °F)	Supermarket	409
	Restaurant	77
	Convenience Store	16

Coincidence Factor (CF)

The recommended coincidence factor for this measure is 1.0[482]

Baseline Efficiencies from which Savings are Calculated

The baseline condition efficiency is a walk-in cooler or freezer door with damaged or missing strip curtains in excess of 15% of the door area.[483]

Compliance Efficiency from which Incentives are Calculated

The compliance condition is a walk-in cooler or freezer with repaired or replaced strip curtains covering the entire open door area.

Operating Hours

Annual hours during which the door is open and strip curtains are therefore preventing heat exchange between the refrigerated case and ambient air is used to determine an estimate of associated demand savings. Prescribed annual hours for formulation of demand savings are provided in the table below.[484]

Case Type	Application	hrs
Cooler (> 32°F)	Supermarket	803
	Restaurant	620
	Convenience Store	230
Freezer (≤ 32 °F)	Supermarket	55
	Restaurant	270
	Convenience Store	230

Effective Useful Life (EUL)

See Appendix P.

Ancillary Fossil Fuel Savings Impacts

Reduction in heat transfer between the refrigerated case and ambient air during periods when the main door is open will result in a small reduction in space heating requirements and a small increase in cooling requirements. This impact is negligible and is not considered in this methodology.

Ancillary Electric Savings Impacts

Reduction in heat transfer between the refrigerated case and ambient air during periods when the main door is open will result in a small reduction in space heating requirements and a small increase in cooling requirements. This impact is negligible and is not considered in this methodology.

FREEZER AND COOLER DOOR GASKETS

Measure Description

Door Gaskets on both freezers (AKA low temperature) or coolers (AKA medium temperature) refrigerated reach-in display cases are subject to damage due to normal use and/or the failure of anti-condensate heater elements. When damaged and/or missing the warmer, more humid air, present in the store will infiltrate the case increasing the demands on the electrical energy consumed by the refrigeration system and often reducing the efficiency of the evaporator unit as frost accumulates impairing its effectiveness. This measure applies to gaskets on both reach-in doors and the main door of walk-in units typical of supermarkets, convenience stores, and restaurants.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta \text{kWh}_{\text{cooler}} = \text{LF}_{\text{door}} \times \Delta \text{kWh}_{\text{cooler,per LF}}$$

$$\Delta \text{kWh}_{\text{freezer}} = \text{LF}_{\text{door}} \times \Delta \text{kWh}_{\text{freezer,per LF}}$$

Peak Coincident Electric Demand Savings

$$\Delta \text{kW}_{\text{cooler}} = \text{LF}_{\text{door}} \times \frac{\Delta \text{kWh}_{\text{cooler,per LF}}}{8760} \times \text{CF}$$

$$\Delta \text{kW}_{\text{freezer}} = \text{LF}_{\text{door}} \times \frac{\Delta \text{kWh}_{\text{freezer,per LF}}}{8760} \times \text{CF}$$

Annual Gas Energy Savings

N/A

where:

ΔkWh_{cooler} = Annual electric energy savings for cooler
$\Delta kWh_{freezer}$ = Annual electric energy savings for freezer
$\Delta kWh_{cooler,\ per\ LF}$ = Annual electric energy savings for cooler door gasket per foot
$\Delta kWh_{freezer,\ per\ LF}$ = Annual electric energy savings for freezer door gasket per foot
ΔkW_{cooler} = Peak coincident electrical demand savings for cooler
$\Delta kW_{freezer}$ = Peak coincident electrical demand savings for freezer
CF = Coincidence Factor
LF_{door} = Linear Feet Damaged / Missing Door Gasket

Summary of Variables and Data Sources

Variable	Value	Notes
ΔkWh_{cooler}	20 kWh/Linear Foot	Annual Energy Savings Attributable to Replacement Door Gasket at a Cooler (> 32° F), Missing / Damaged Weighted Average[1]
$\Delta kWh_{freezer}$	152 kWh/Linear Foot	Annual Energy Savings Attributable to Replacement Door Gasket at a Freezer (< 32° F), Missing / Damaged Weighted Average[1]
CF	0.8	Default Value
LF_{door}	# LF	Length of Damaged or Missing Gaskets expressed as Linear Feet

Coincidence Factor (CF)

The recommended coincidence factor for this measure is 0.8 consistent with all commercial air conditioning applications.

Baseline Efficiencies from which Savings are Calculated

The baseline efficiency is premised on a door with damaged and or missing gaskets. A weighted average is used to proportion energy savings between both these conditions premised on the survey results conducted by the referenced study, Table 5-4.

Compliance Efficiency from which Incentives are Calculated

The compliance efficiency is premised on the replacement of the entire door gasket so as to achieve a minimum 1.5% or less infiltration rate.

Operating Hours

REFRIGERATION - CONTROL

ANTI-CONDENSATION HEATER CONTROL

Measure Description

This measure covers the installation of anti-condensation heater controls on glass door reach-in refrigerated cases. These controls save energy by reducing door heater run times based on feedback from door moisture sensors or dew point calculated via indoor air temperature and humidity sensors. Additional savings are achieved through interactive effects with the system's compressor. By running less often, door heaters emit less heat that must be overcome by the compressor. There are two primary categories of anti-condensation heater controls – (1) on/off controls and (2) pulse modulating controls. On/off controls cycle door heaters for several minutes at a time whereas pulse modulating controls pulse the door heaters at varying frequencies to satisfy calls for heating.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = (kW_{DH} \times hrs_{baseline}) - (kW_{DH} \times F_{PA} \times hrs_{ee})$$

Peak Coincident Demand Savings

$$\Delta kW = kW_{DH} \times F_{hrs} \times DF$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
kW_{DH}	= Total power of door heaters (in kW)
hrs	= Operating hours
baseline	= Baseline condition or measure
ee	= Energy efficient condition or measure
F_{PA}	= Power adjustment factor
F_{hrs}	= Operating hours reduction factor
DF	= Demand diversity factor

Summary of Variables and Data Sources

Variable	Value	Notes
kW_{DH}		From application, calculated based on door heater nameplate voltage and amperage.
$hrs_{baseline}$	8,760	Pre-installation operating hours; assumes 24/7, year-round operation of door heaters
hrs_{ee}	Coolers - 3,760 Freezers – 8,760	Post-installation operating hours. Freezer hours assume 24/7, year round operation of door heaters and varying power factors. Cooler hours estimated by National Resource Management (NRM) based on monitoring data collected of cooler door heater controls.[485]
F_{PA}	Coolers – 0.60 Freezers – 0.54	Average operating percentage of total door heater power after installation. Estimated by NRM based on monitoring data collected of cooler and freezer door heater controls. F_{PA} for freezers is calculated based on 4,000 hours of operation at 40% power and 4,760 hours at 65%.[486]
F_{hrs}	Coolers - 0.74 Freezers – 0.46	Annual operating hour reduction factor. Estimated by National Resource Management (NRM) based on monitoring data collected of cooler and freezer door heater controls.[487]
DF	0.75	Estimated adjustment to account for diversity and peak coincidence.[488]

Coincidence Factor (CF)

The recommended value for the coincidence factor is N/A. Adjustments to account for peak coincidence are embedded in the demand diversity factor defined above.

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a glass door reach-in refrigerated case anti-condensation heaters without temperature/humidity sensing controls.

Compliance Efficiency from which Incentives are Calculated

The compliance case is a glass door reach-in refrigerated case with on/off or pulse modulating anti-condensation heater controls installed.

Operating Hours

Anti-condensation door heaters without automated controls operate 24/7 year-round (8,760 hours annually). Operating hours for the compliance case are as specified above.

Ancillary Fossil Fuel Savings Impacts
Reduction of door heater operation will slightly increase space heating load. However, these impacts are negligible and not considered at this time.

Ancillary Electric Savings Impacts
Reduction in door heater operation reduces heat that must be displaced by the compressor. Interactive effects are addressed in the prescribed energy savings calculation methodology.

489 CA DEER – 2014 Updated EUL Records

EVAPORATOR FAN CONTROL

Measure Description

This measure covers the installation of on/off or multispeed controls on electronically commutated or shaded pole evaporator fan motors in walk-in refrigerated cases. Evaporator fans in walk-in coolers and freezers that are not equipped with controls operate at constant speed continuously, even when there is no call for refrigeration and the compressor is idle. Installation of controls allows for modulation of evaporator fans, reducing fan speed or turning them off when the compressor is not running. Reduction in energy consumption results from reduced run time of the evaporator fans as well as reduction in waste heat due to fan operation that must be rejected by the system.

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times hp \times (\Delta kWh/hp)$$

Peak Coincident Demand Savings

$$\Delta kW = units \times hp \times (\Delta kW/hp)$$

Annual Gas Energy Savings

$$\Delta therms = N/A$$

where:

ΔkWh = Annual electric energy savings
ΔkW = Peak coincident demand electric savings
Δtherms = Annual gas energy savings
units = Number of evaporator fans controlled
hp = Horsepower per evaporator fan
(ΔkWh/hp) = Annual electric savings per evaporator fan horsepower
(ΔkW/hp) = Peak coincident demand electric savings per evaporator fan horsepower

Summary of Variables and Data Sources

Variable	Value	Notes
hp		From application. If unknown, assume 1/15 hp.[490]
(ΔkWh/hp)		Lookup from Deemed Savings table below based on case type, evaporator fan motor type and proposed control type.
(ΔkW/hp)		Lookup from Deemed Savings table below based on case type, evaporator fan motor type and proposed control type.

[490] Cadmus, Commercial Refrigeration Loadshape Project, October 2015, pg. 6

Deemed Savings (ΔkWh/hp and ΔkW/hp)[491]

Case Type	Motor Type	Control Type	ΔkWh/hp	ΔkW/hp
Cooler	Shaded Pole	On/Off	8,650	0.776
		Multispeed	7,224	0.741
	ECM	On/Off	3,142	0.282
		Multispeed	2,624	0.269
Freezer	Shaded Pole	On/Off	10,991	0.990
		Multispeed	9,178	0.945
	ECM	On/Off	3,992	0.360
		Multispeed	3,334	0.343

Coincident Factor (CF)

Demand savings provided in the table above represent peak coincident summer demand savings. Coincidence factor is embedded in deemed savings values; therefore, no coincidence factor is independently prescribed.

Baseline Efficiencies from which Savings are Calculated

The baseline condition is a walk-in cooler or freezer with shaded pole or electronically commutated evaporator fan motors that operate continuously at constant speed (i.e. with no controls installed).

Compliance Efficiency from which Incentives are Calculated

The compliance condition is a walk-in cooler or freezer with shaded pole or electronically commutated evaporator fan motors equipped with on/off or multispeed evaporator fan controls.

Operating Hours

Annual evaporator fan operating hours for the baseline and proposed case are embedded in the deemed savings values provided above. It is assumed that evaporator fans without controls have an effective full load annual run time of 97.8% x 8,760 = 8,567 hours. The effective full load annual run time of evaporator fans with on/off control are assumed to be 63.6% x 8,760 = 5,571 hours, while the effective full load annual run time of evaporator fans with multispeed control are assumed to be 69.2% x 8,760 = 6,062 hours.

Effective Useful Life (EUL)

CUSTOM MEASURES

This section is designed to provide New York's program administrators (PAs) with additional clarification of the DPS review and oversight procedures for custom measures and applications. The overriding DPS goal is to conduct its oversight responsibilities in a manner that protects ratepayer dollars without unduly limiting the ability of PAs to meet their energy savings goals and administer their programs effectively.

The PAs have the responsibility to develop accurate and unbiased estimates of energy savings of custom projects including addressing quality control, project application review, and energy savings calculations. The processes used by PAs to meet these responsibilities will be reviewed by DPS to ensure accountability and transparency. To minimize the impact on the delivery of services through currently operating programs, PAs may continue to operate their programs while the DPS review process is ongoing.

DEFINITIONS

Quality Control (QC) – Policies and procedures established by the PA to ensure the quality of the energy efficiency measures and services delivered to customers. Quality control activities may include factors such as the minimum requirements for energy calculations, model calibration to billing data, application review criteria, reporting requirements, pre and/or post inspections, measurement and verification (M&V) of energy savings, and qualifications of service providers.

Quality Assurance (QA) – Third party verification activities that ensure QC policies and procedures established by the PAs are working as intended, and provide recommendations for modification of QC policies and procedures as necessary.

Prescriptive Measure – Measure which is offered within specific efficiency programs with a prescribed incentive amount or level for all customers participating in the applicable programs. Not all prescriptive measures are necessarily prequalified (i.e., approved by the DPS for offering within a program).

Prequalified Measure – Measure reviewed for cost-effectiveness by the DPS and approved for offering within a program. All prequalified measures are prescriptive measures, but it is the responsibility of the PAs to ensure that all prequalified measures are cost effective within their programs.

Custom Measure – The traditional definition of a custom measure involves unique, and often complex, technologies and processes installed in large facilities. A detailed engineering analysis is usually required and incentives are offered based on the site-specific expected energy savings and costs. Energy savings are estimated using a site-specific engineering analysis. The engineering analysis technique is chosen based on the measure and facility type with the calculations driven by site and measure-specific data. For our purposes, this category also covers infrequently implemented measures or applications that are not listed in an existing prescriptive program.

EEPS/SBC CUSTOM MEASURES

(Four Categories)

For the EEPS and SBC energy efficiency programs custom measures includes the following four categories:

Measures that are not included in the Tech Manual and are unique to a specific non-standard process or application, as application conditions can substantially change from project to project. For example, this category might include custom industrial processes, snowmaking, and computer chip fabrication facilities.

Measures that are not in category 1, including prescriptive measures that are promoted by the programs, but are not included in the Tech Manual. Examples in this category include EC motors on HVAC system fans and indirect water heaters.

Measures that are in the Tech Manual, but that are installed in a different environment or have a different use conditions than those assumed in the Tech Manual. Examples in this category include certain comprehensive chiller and cooling tower upgrades.

Measures that are in the Tech Manual, but that require simulation modeling or other advanced approaches in order to estimate interactive effects within a facility (if different from category 3). Examples in this category include whole-building performance programs addressing single and multi-family projects and commercial new construction.

CATEGORY 1 – UNIQUE MEASURES/PROJECTS

This section outlines the DPS's policy for reviewing quality control and quality assurance policies and procedures for programs offering measures unique to a specific non-standard process or application.

Critical review of the project energy savings projections and costs is essential to ensure projects are cost-effective and deliver the expected savings. This is especially important for one-of-a-kind projects, where the savings are large, and the expertise needed to understand and verify energy savings projections is specialized. DPS expects that the PAs will utilize an internal process for reviewing and approving large custom projects including screening for cost-effectiveness. DPS will review this process for completeness and transparency. PAs offering large custom incentive programs must also submit their QC and QA processes to the DPS for review. Any issues resulting from these reviews will be reported to the PAs, along with a list of requirements and a schedule for resolving these issues. The QC and QA functions may be staffed internally or provided by outside contractors. Contractors must possess appropriate certification and demonstrated expertise in the technology or processes proposed for the project. As a component of the QC and QA process review, the qualifications of contractors will be reviewed by the DPS.

If the PA has an existing impact evaluation study capable of informing the energy savings of a custom measure(s), this study may serve as the basis for reporting energy savings, provided the study is reviewed by DPS and meets current EEPS evaluation guidelines and standards.

In order to keep the DPS informed of projects and to assist in its review, the PAs will submit monthly reports showing the progress of all "unique" custom projects in the review and approval pipeline. The report must include a description of customer type and the proposed project, the stage of development, energy and demand savings estimates including baseline assumptions, and the expected approval and construction schedule. The DPS, at its discretion, will review selected projects. The DPS will inform the PAs of its intent to review selected projects and provide the PAs with a review schedule.

As part of the PAs evaluation plan, PAs must conduct impact evaluation on a sample of these custom projects to verify the energy savings claims. Staff may require a project specific impact evaluation for very large projects. Realization rates will be reviewed and possibly revised as evaluation studies provide more data.

CATEGORY 2 – MEASURES INCLUDING PRESCRIPTIVE MEASURES NOT IN THE TECH MANUAL

The DPS understands that PAs are offering, or will be offering, incentives for measures not included in the Tech Manual. It is the responsibility of the PAs to ensure that all measures are cost effective. The DPS will review the calculation procedures used by the PAs to estimate energy savings, set incentive levels, and show cost-effectiveness. The calculation reviews will be used to verify savings claims and cost-effectiveness, reconcile differences between PAs offering similar measures, and along with results from impact evaluations, inform updates of the Tech Manuals.

PAs must submit calculations for review in a timely manner. The DPS will establish a priority for reviewing these calculations based on the expected number of program applications and the expected uncertainty in the energy savings estimates. PAs can report energy savings using their internal estimates prior to the completion of the calculation reviews. Once the reviews are completed and the energy savings adjustments are identified, the DPS will establish a schedule for incorporating the revised energy savings estimates into the reporting process.

CATEGORY 3 – MEASURES IN TECH MANUAL BUT USED IN A DIFFERENT APPLICATION/ENVIRONMENT

The DPS will review the PAs processes for reviewing and approving these custom installations, along with the associated QC and QA policies and procedures. Project review and approval must include a cost-effectiveness screening for each custom project. The QC and QA functions may be staffed internally or provided by outside contractors. Contractors must possess appropriate certification and demonstrated expertise in the technology or processes proposed for the project. As a component of the QC and QA process review, the qualifications of contractors will be reviewed by the DPS.

If the PA has an existing impact evaluation study capable of informing the energy savings of a custom measure(s), this study may serve as the basis for reporting energy saving provided that the study is reviewed by the DPS and the meets current EEPS evaluation guidelines and standards.

The DPS will review procedures used to verify energy savings and approve projects for incentives. Processes used to establish project baselines and energy savings, including engineering analysis tools and simulation software, will be reviewed by the DPS. The DPS may review a sample of project energy savings and cost-effectiveness calculations to check compliance with the approved internal QC processes. Any issues resulting from DPS reviews will be reported to the PAs, along with a list of requirements and a schedule for resolving these issues.

As part of the evaluation plan, PAs must conduct impact evaluations on at least a sample of custom measures to verify the savings claims. Staff may require a project specific impact evaluation for very large projects. Realization rates will be reviewed by the DPS and possibly revised as evaluation studies provide more data.

Category 4 – Whole-Building Analysis

The whole-building approach is commonly applied to new construction projects (both residential and commercial) and specialized retrofit programs such as the Home Performance with Energy Star. These programs use a building energy simulation model to calculate energy savings for a combination or “package” of measures. The building energy simulation models are informed by detailed building audits and may include building diagnostic testing to identify energy savings opportunities.

Many of the PAs have developed internal processes for reviewing and verifying savings estimates developed under the whole-building analysis approach. PAs offering programs utilizing the whole-building approach must submit their QC and QA processes to the DPS for review. Any issues resulting from DPS reviews will be reported to the PAs along with a list of requirements and a schedule for resolving these issues. The QC and QA functions may be staffed internally or provided by outside contractors. Contractors must possess appropriate certification and demonstrated expertise in whole-building performance analysis. As a component of the QC and QA process review, the qualifications of contractors will be reviewed by the DPS.

The DPS will review the processes used to establish project baselines and energy savings estimates, including requirements for calibrating models to measured data or benchmarking results to established energy metrics. This effort will include a review of analysis tools and simulation software including the administrator’s expertise in their application. Evidence of certifications by a third party organization such as the Building Performance Institute or RESNET would be helpful and should be provided by the PA, if available. At the discretion of the DPS, a sample of project energy savings and cost-effectiveness calculations will be reviewed to check compliance with the approved internal QC processes.

Since the measures contained within the package can influence and interact with each other, the whole building analysis gives a good representation of the savings of the overall package of measures, but does not necessarily provide the information needed to understand the contributions of individual measures to the total savings estimate. It is also difficult to isolate the costs of each energy savings measure from the total project cost (especially in new construction projects). As a result, individual measure cost-effectiveness screening is difficult to conduct within a whole-building analysis framework. Although the overall project may be cost effective, there may be "cross subsidies", where highly cost effective measures are compensating for the lack of cost-effectiveness of other measures. Each measure should be cost effective on its own.

As part of the PAs evaluation plan, PAs must conduct impact evaluation on at least a sample of custom projects to verify the savings claims. Staff may require a project specific impact evaluation for very large projects. Realization rates will be reviewed and possibly revised as evaluation studies provide more data.

Recommended Application Review and QC Procedures for Custom Programs
As stated above, the DPS will conduct reviews of the application review and QC procedures in place for custom programs. The following tables provide a list of issues the application review QC procedures for custom programs should address.

Energy Savings Calculations

Issue	Criteria
Baseline definition	List the criteria used to define the project baseline. The DPS will issue further clarification on baseline requirements in a separate document.
Energy savings calculation methods	List acceptable calculation methods, including approved building energy simulation models and other software
Calibration	Define when calculations must be calibrated with measured data. The acceptable sources of measured data should be defined. The calibration statistics in terms of allowable deviation between calculations and measured data should be defined along with allowable adjustment ranges on important input parameters.
Calculations outside of approved tools	When approved tools are required, list restrictions on calculations that can be performed outside of the tools.
Simulation guidelines	Provide general guidance on acceptable modeling practices for building energy simulation models.
Field measurement requirements	List requirements for field measurements that must be taken and included in the measure savings calculation process.

Application Review Process

Issue	Criteria
Program applicability	Check that the application meets each of the program applicability requirements.
Measure cost requirements	Provide guidance on acceptable sources and processes for estimating measure costs. Clarify the need for full measure costs and incremental costs, and breakdowns by labor and materials as required.

Issue	Criteria
Cost-effectiveness calculation method	Provide guidance on how cost-effectiveness calculations should be done, including the required formulas and data sources. Spreadsheets and other software tools conforming to approved cost-effectiveness calculation procedures may be used to meet this requirement.
Consideration of non-energy benefits (NEBs)	Describe requirements for identifying and quantifying expected non-energy benefits as applicable.
Application approval procedures	Describe the application review procedures, including the affiliations and qualifications of reviewers.

Project QC Procedures

Issue	Criteria
Sampling requirements	Describe sampling procedures used to review projects, including numbers of projects reviewed and the distribution of the sample across contractors and consultants. Describe sampling procedures for measures within a particular project as required.
Pre Inspections	Describe requirements for pre-installation inspections, including data collection requirements and the role of pre-installation inspections in the energy savings calculations.
Post inspections	Describe requirements for post-installation inspections, including data collection requirements and the role of post-installation inspections in the energy savings calculations, measure verification and incentive payment release.
Performance testing	Describe requirements for performance testing of measures as a component of post-installation measure installation verification and incentive payment release.
Commissioning	Describe requirements for project or building commissioning as applicable, including review and approval of commissioning plans and qualifications of commissioning agents and/or service providers.
M&V	Describe post-installation M&V requirements and the role of M&V in project verification and incentive payment release.
Contractor certification	Describe certification requirements for contractors providing project construction and quality control services.
Minimum experience	In addition to certifications, any minimum experience requirements for contractors should be listed.
Training	List requirements for ongoing training.
PA notification requirements	Protocols for informing a PA representative of issues with project quality should be described.

Consultant QC Procedures

Issue	Criteria
Reporting requirements	Minimum requirements for consultant reports should be described.
Report review and approval	The report review procedures and affiliations and qualifications of report reviewers should be described.
Evaluation criteria	Evaluation criteria for consultant QC reviews should be listed.
Sampling requirements	Sampling procedures for consultant QC reviews should be described.
Consultant certifications	Certification requirements for consultants should be listed.
Consultant skills and experience	Beyond basic certification requirements, a description of the skill and experience requirements for consultants should be listed.
PA notification requirements	Protocols for informing a PA representative of issues with consultant services quality should be described.

Record of Revision

Record of Revision Number	Issue Date

APPENDIX A

BUILDING TYPES

The sections that follow provides savings data by building type. A description and additional details of each building type is shown in the table below and the sections that follow.

Note: the building type classifications are defined primarily by activity, HVAC system type, and number of floors since the deemed parameters in the Tech Manual are generally normalized to equipment or measure size.

Building Type	*Description*
Assembly	Public buildings that include community centers, libraries, performance and movie theaters, auditoria, police and fire stations, gymnasia, sports arenas, and transportation terminals
Auto	Repair shops and auto dealerships, including parking lots and parking structures.
Big Box	Single story, high-bay retail stores with ceiling heights of 25 feet or more. Majority of floor space is dedicated to non-food items, but could include refrigerated and non-refrigerated food sales areas.
Community College	Community college campus and post-secondary technical and vocational education buildings, including classroom, computer labs, dining and office. Conditioned by packaged HVAC systems
Dormitory	College or University dormitories
Fast Food	Self-service restaurants with primarily disposable plates, utensils etc.
Full Service Restaurant	Full service restaurants with full dishwashing facilities
Grocery	Refrigerated and non-refrigerated food sales, including convenience stores and specialty food sales
Heavy Industrial	Single or multistory buildings containing industrial processes including pump stations, water and wastewater treatment plants; may be conditioned or unconditioned.
Hospital	Inpatient and outpatient care facility conditioned by built-up HVAC systems. Excludes medical offices
Hotel	Multifunction lodging facility with guest rooms, meeting space, foodservice conditioned by built-up HVAC system
Industrial Refrigeration	Refrigerated warehouses and food processing facilities maintained at space temperatures of 55 °F or less.
Large Office	Office space in buildings greater than 3 stories conditioned by built-up HVAC system.
Light Industrial	Single story work space with heating and air-conditioning; conditioned by packaged HVAC systems
Multi-family high-rise	Multi-family building with more than 3 stories conditioned by built up HVAC system
Multi-family low-rise	Multi-family building with 3 stories or less conditioned by packaged HVAC system
Motel	Lodging facilities with primarily guest room space served by packaged HVAC systems
Multi Story Retail	Retail building with 2 or more stories served by built-up HVAC system
Primary School	K-8 school
Religious	Religious worship
Secondary School	9-12 school

Building Type	*Description*
Single-family residential	Single-family detached residences
Small Office	Office occupancy in buildings 3 stories or less served by packaged HVAC systems; includes Medical offices
Small Retail	Single story retail with ceiling height of less than 25 feet; primarily non-food retail and storage areas served by packaged HVAC systems. Includes service businesses, post offices, Laundromats, and exercise facilities.
University	University campus buildings, including classroom, computer labs, biological and/or chemical labs, workshop space, dining and office. Conditioned by built-up HVAC systems
Warehouse	Primarily non-refrigerated storage space could include attached offices served by packaged HVAC system.

Note: for commercial buildings that cannot be reasonably associated with one the building types above, savings values for the "other" category should be used.

Prototypical Building Descriptions

Residential Building Prototypes

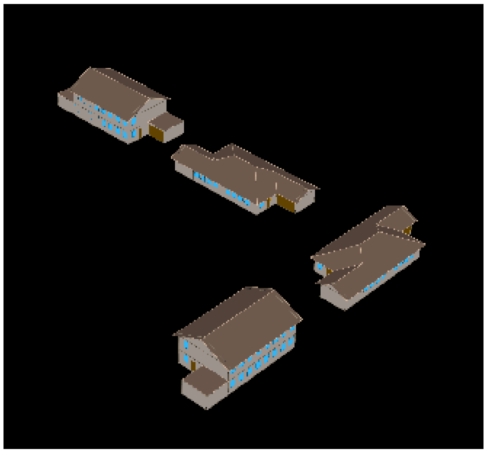
Analysis used to develop parameters for the energy and demand savings calculations are based on DOE-2.2 simulations of a set of prototypical residential buildings. The prototypical simulation models were derived from the residential building prototypes used in the California Database for Energy Efficiency Resources (DEER)[492] study, with adjustments made for local building practices and climate. Three separate models were created to represent general vintages of buildings:

- Old, poorly insulated buildings constructed before 1979, before the NY State Energy Code went into effect. This vintage is referred to as the "old" vintage.
- Existing, average insulated buildings conforming to 1980s era building codes. This vintage is referred to as the "average" vintage, covering buildings constructed from 1979 to 2006.
- New construction conforming to the 2007 Energy Conservation Construction Code of New York State (ECCCNYS) for residential buildings. This vintage is referred to as the "new" vintage, and covers buildings constructed from 2007 to present.

Single-family Residential Prototype

The single-family "model" in fact contains four separate residential buildings: 2 one-story and 2 two-story buildings. Each version of the 1 story and 2 story buildings are identical except for the orientation, which is shifted by 90 degrees. The selection of these four buildings is designed to give a reasonable average response of buildings of different design and orientation to the impact of energy efficiency measures. A sketch of the single-family residential prototype buildings is shown below.

[492] 2004-2005 Database for Energy Efficiency Resources (DEER) Update Study, Final Report, Itron, Inc. Vancouver, WA. December 2005. Available at www.calmac.org/publications/2004-05_DEER_Update_Final_Report-Wo.pdf



The general characteristics of the single-family residential building prototype model are summarized below.

SINGLE-FAMILY RESIDENTIAL BUILDING PROTOTYPE DESCRIPTION

Characteristic	Value
Vintage	Three vintages simulated – old poorly insulated buildings, existing average insulated buildings and new buildings
Conditioned floor area	1 story house: 1465 SF (not including basement) 2 story house: 2930 SF (not including basement)
Wall construction and R-value	Wood frame with siding, R-value varies by vintage
Roof construction and R-value	Wood frame with asphalt shingles, R-value varies by vintage
Glazing type	Single and double pane; properties vary by vintage
Lighting and appliance power density	0.51 W/SF average
HVAC system type	Packaged single zone AC or heat pump
HVAC system size	Based on peak load with 20% over-sizing.
HVAC system efficiency	Baseline SEER = 13
Thermostat set points	Heating: 70°F with setback to 67°F Cooling: 75°F with setup to 78°F
Duct location	Buildings without basement: attic Buildings with basement: basement
Duct surface area	Single story house: 390 SF supply, 72 SF return Two story house: 505 SF supply, 290 SF return
Duct insulation	Uninsulated
Duct leakage	20% of fan flow total leakage evenly split between supply and return.
Natural ventilation	Allowed during cooling season when cooling set point exceeded and outdoor temperature < 65°F. 3 air changes per hour

Wall, Floor and Ceiling Insulation Levels

The assumed values for wall and ceiling by vintage are shown below.

WALL INSULATION R-VALUE ASSUMPTIONS BY VINTAGE

Vintage	Assumed R-value of insulated wall	Notes
Older, poorly insulated	4.8	No insulation in 2 by 4 wall; 3.5 in. air gap resistance only
Existing, average insulation	11	Fiberglass insulation in 2 by 4 wall per MEC 1980
New construction	19	Code

CEILING INSULATION R-VALUE ASSUMPTIONS BY VINTAGE

Vintage	Assumed R-value of insulated ceiling	Notes
Older, poorly insulated	11	Minimal ceiling insulation
Existing, average insulation	19	Fiberglass insulation per MEC 1980
New construction	30 (NYC), 38 (all others)	Code

Windows

The glazing U-value and solar heat gain coefficient (SHGC) assumptions for the three vintages are shown below.

WINDOW PROPERTY ASSUMPTIONS BY VINTAGE

Vintage	U-value (BTU/hr-F-SF)	SHGC	Notes
Older, poorly insulated	0.93	0.87	Single pane clear
Existing, average insulation	0.87	0.77	Double pane clear
New construction	0.28	.49	Double low e

Infiltration

Infiltration rate assumptions were set by vintage as shown below.

INFILTRATION RATE ASSUMPTIONS BY VINTAGE

Vintage	Assumed infiltration rate	Notes
Older, poorly insulated	1 ACH	
Existing, average insulation	0.5 ACH	
New construction	0.35 ACH	Minimum without forced ventilation per ASHRAE Standard 66.

MULTI-FAMILY LOW-RISE

The low-rise prototype "model" in fact contains 2 separate buildings. Each version of the buildings is identical except for the orientation, which is shifted by 90 degrees. The selection of these 2 buildings is designed to give a reasonable average response of buildings of different design and orientation to the impact of energy efficiency measures.

Four separate models were created to represent general vintages of buildings:

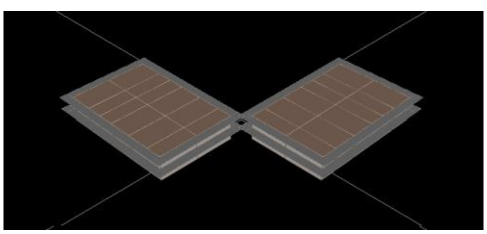
- Built prior to 1940, uninsulated masonry buildings. This vintage is referred to as "Pre-war uninsulated brick."

- Built prior to 1979 when the NYS Energy Code (known as the Energy Conservation Construction Code of New York State – ECCCNYS) went into effect, poorly insulated wood-frame buildings This vintage is referred to as "Prior to 1979"

- Built from 1979 through 2006, with insulation conforming to 1980s era building codes (1979 ECCCNYS.) This vintage is referred to as "From 1979 through 2006."

- Built from 2007 through the present, new construction with insulation conforming to the 2007 ECCCNYS for residential buildings and the New York City Energy Conservative Construction Code (if applicable.) This vintage is referred to as "From 2007 through the present."

Each building vintage was run with 7 different HVAC system types to capture the range of HVAC systems common in low-rise multi-family buildings. A sketch of the low-rise prototype buildings is shown below.



The general characteristics of the residential building prototype model are summarized below.

MULTI-FAMILY LOW-RISE RESIDENTIAL BUILDING PROTOTYPE DESCRIPTION

Characteristic	Value
Vintage	Four vintages simulated: Pre-war uninsulated brick; Prior to 1979 (wood frame); From 1979-2006; and From 2007 to present
Conditioned floor area	949 SF per unit; 6 units per floor, 2 floors per building, 11,388 SF total.
Wall construction and R-value	R-value and construction varies by vintage.
Roof construction and R-value	Wood frame with asphalt shingles. R-value varies by vintage.
Glazing type	Single or double pane. Properties vary by vintage.
Lighting and appliance power density	0.87 W/SF average in bedrooms, 0.58 W/SF in living space.

Characteristic	Value
HVAC system types	1. Split system AC with central gas heat 2. Split system AC with electric heat 3. Split system heat pump 4. PTAC with electric heat 5. PTHP 6. Electric heat only (no AC) 7. Central gas heat only (no AC) 8. Central steam (within the building) heat only (no AC)
HVAC system size	Based on peak load with 20% over-sizing.
HVAC system efficiency	AC and heat pump: SEER = 13 PTAC and PTHP: EER = 7.7 Furnace / boiler: AFUE = 78% Steam boiler: AFUE = 75%
Thermostat set points	1. Heating: 70^{0}F with setback to 67^{0}F(other than NYC); 73^{0}F with setback to 70^{0}F (NYC only) 2. Cooling: 75°F with setup to 78°F
Duct location (for systems with ducts)	In attic and plenum space between first and second floors. PTACs and PTHPs have no ductwork.
Duct surface area (for systems with ducts)	256 SF supply, 47 SF return per system
Duct insulation (for systems with ducts)	Uninsulated
Duct leakage (for systems with ducts)	20% of fan flow total leakage, evenly split between supply and return.
Natural ventilation	Allowed during cooling season when cooling set point exceeded and outdoor temperature < 65°F. 3 air changes per hour

Wall and Ceiling Insulation Levels

The assumed values for wall and ceiling by vintage are below.

WALL INSULATION R-VALUE ASSUMPTIONS BY VINTAGE

Vintage	Assumed R-value of insulated wall	Notes
Pre-war uninsulated brick	4	Three 4" brick layers. No insulation. 2" air gap resistance only.
Prior to 1979	7	Wood frame with siding. No insulation in 2 by 4 wall; 3.5" air gap resistance only
From 1979 through 2006	11	Wood frame with siding. Fiberglass insulation in 2 by 4 wall per MEC 1980.
From 2007 through the present	19	Code

CEILING INSULATION R-VALUE ASSUMPTIONS BY VINTAGE

Vintage	Assumed R-value of insulated ceiling	Notes
Pre-war uninsulated brick	2	No ceiling insulation
Prior to 1979	11	Minimal ceiling insulation
From 1979 through 2006	19	Fiberglass insulation per MEC 1980
From 2007 through the present	38	NYS Code for climate zones 4 & 5
	49	NYS Code for climate zone 6

THERMOSTATIC HEATING SET POINT ASSUMPTIONS BY VINTAGE

Vintage	Set point and setback (°F)	Notes
Pre-war uninsulated brick	73, 70	NYC
	70, 67	All others
Prior to 1979	70, 67	
From 1979 through 2006	70, 67	
From 2007 through the present	70, 67	

Windows

The glazing U-value and solar heat gain coefficient (SHGC) assumptions for the four vintages are shown below.

WINDOW PROPERTY ASSUMPTIONS BY VINTAGE

Vintage	U-value (BTU/hr-°F-SF)	SHGC	Notes
Pre-war uninsulated brick	0.93	0.87	Single pane clear
Prior to 1979	0.93	0.87	Single pane clear
From 1979 through 2006	0.68	0.77	Double pane clear
From 2007 through the present	0.28	0.49	Double low e per code

Infiltration

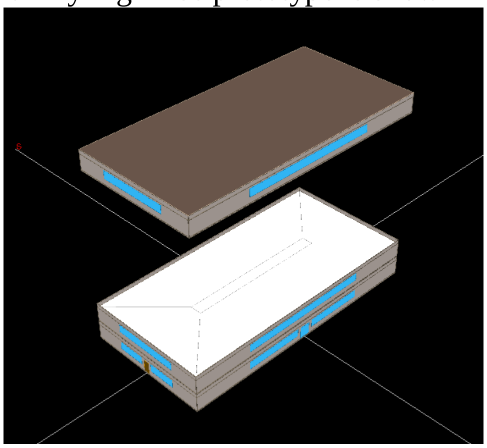
Infiltration rate assumptions were set by vintage as shown below.

INFILTRATION RATE ASSUMPTIONS BY VINTAGE

Vintage	Assumed infiltration rate	Notes
Pre-war uninsulated brick	1 ACH	
Prior to 1979	1 ACH	
From 1979 through 2006	0.5 ACH	
From 2007 through the present	0.35 ACH	Minimum without forced ventilation per ASHRAE Standard 66.

MULTI-FAMILY HIGH-RISE

The multi-family high-rise model was developed using the conceptual design "wizard" in eQUEST program, rather than a DEER prototype. A computer-generated sketch of the multi-family high-rise prototype is shown in the figure below.



Note: The middle floors, since they thermally equivalent, are simulated as a single floor, and the results are multiplied by 8 to represent the energy consumption of the 8 middle floors. The general characteristics of the multi-family high-rise building prototype model are summarized below.

MULTI-FAMILY HIGH-RISE RESIDENTIAL BUILDING PROTOTYPE DESCRIPTION

Characteristic	Value
Vintage	Four vintages simulated: Pre-war uninsulated brick; Prior to 1979 (wood frame); From 1979-2006; and From 2007 to present
Conditioned floor area	810 SF per unit; 10 units per floor, 10 floors per building; 81,000 SF total living space. Corridors and common space: 18,255 SF; Laundry rooms: 6,845 SF Storage: 7,985 SF Total: 114,085 SF
Wall construction and R-value	Masonry wall with brick exterior, R-value varies by vintage
Roof construction and R-value	Wood frame with built-up roofing, R-value varies by vintage
Glazing type	Single or double pane; properties vary by vintage
Lighting and appliance power density	0.7 W/SF average
HVAC system type	1. Four pipe fan coil with air cooled electric chiller and gas hot water boiler 2. Central building steam
HVAC system size	Based on peak load with 20% over-sizing.
HVAC system efficiency	Chiller: COP = 3.9 Hot water boiler: Thermal efficiency = 78% Steam boiler: thermal efficiency = 75%
Thermostat set points	1. Heating: 70^{0}F with setback to 67^{0}F(other than NYC); 73^{0}F with setback to 700F (NYC only) 2. Cooling: 75°F with setup to 78°F

Wall, Floor Insulation Levels
The assumed values for wall and ceiling by vintage are shown below.

WALL INSULATION R-VALUE ASSUMPTIONS BY VINTAGE

Vintage	Assumed R-value of insulated wall	Notes
Pre-war uninsulated brick	4	Same as low-rise
Prior to 1979	7	No insulation; air gap resistance only
From 1979 through 2006	11	Same as low-rise
From 2007 through the present	19	Code

ROOF INSULATION R-VALUE ASSUMPTIONS BY VINTAGE

Vintage	Assumed R-value of insulated ceiling	Notes
Pre-war uninsulated brick	2	Same as low-rise
Prior to 1979	11	Same as low-rise
From 1979 through 2006	19	Same as low-rise
From 2007 through the present	38	Code for climate zone 4 & 5
	49	Code for climate zone 6

THERMOSTATIC HEATING SET POINT ASSUMPTIONS BY VINTAGE

Vintage	Assumed R-value of insulated ceiling	Notes
Pre-war uninsulated brick	2	Same as low-rise
Prior to 1979	11	Same as low-rise
From 1979 through 2006	19	Same as low-rise
From 2007 through the present	38	Code for climate zone 4 & 5
	49	Code for climate zone 6

Windows

The glazing U-value and solar heat gain coefficient (SHGC) assumptions for the four vintages are shown below.

WINDOW PROPERTY ASSUMPTIONS BY VINTAGE

Vintage	U-value (BTU/hr-F-SF)	SHGC	Notes
Pre-war uninsulated brick	0.93	0.87	Single pane clear
Prior to 1979	0.93	0.87	Single pane clear
From 1979 through 2006	0.68	0.77	Double pane clear
From 2007 through the present	0.28	0.49	Double low E per code

Infiltration

Infiltration rate assumptions were set by vintage as shown below.

INFILTRATION RATE ASSUMPTIONS BY VINTAGE

Vintage	Assumed infiltration rate	Notes
Pre-war uninsulated brick	1 ACH	
Prior to 1979	1 ACH	Same as low-rise
From 1979 through 2006	0.5 ACH	Same as low-rise
From 2007 through the present	0.35 ACH	Minimum without forced ventilation per ASHRAE Standard 66.

COMMERCIAL BUILDING PROTOTYPES

Analysis used to develop parameters for the energy and demand savings calculations is based on DOE-2.2 simulations of a set of prototypical small and large buildings. The prototypical simulation models were derived from the commercial building prototypes used in the California Database for Energy Efficiency Resources (DEER)[493] study, with adjustments made for local building practices and climate.

The primary distinction between small and large buildings is the HVAC system type rather than a specific conditioned floor area criterion. Small buildings in this study utilize packaged rooftop HVAC systems or packaged terminal air conditioners (PTAC). Large buildings use built-up HVAC systems with chillers and boilers.

Note: for purposes of applying the building type specific results to buildings not included in the prototype list, use the "other" category within each applicable measure savings section.

Assembly

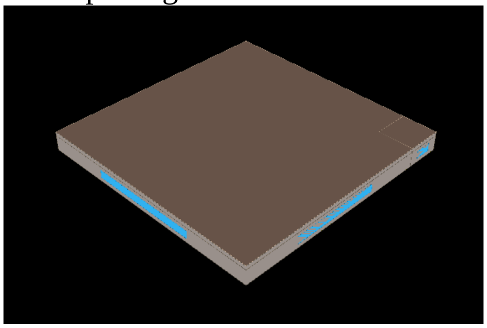
A prototypical building energy simulation model for an assembly building was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the prototype are summarized below.

ASSEMBLY PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	34,000 square feet Auditorium: 33,240 SF Office: 760 SF
Number of floors	1
Wall construction and R-value	Concrete block, R-5
Roof construction and R-value	Wood frame with built-up roof, R-12
Glazing type	Single pane clear
Lighting power density	Auditorium: 3.4 W/SF Office: 2.2 W/SF
Plug load density	Auditorium: 1.2 W/SF Office: 1.7 W/SF
Operating hours	Mon-Sun: 8am – 9pm
HVAC system type	Packaged single zone, no economizer
HVAC system size	100 - 110 SF/ton depending on climate
Thermostat set points	Occupied hours: 76 cooling, 72 heating Unoccupied hours: 79 cooling, 69 heating

493 2004-2005 Database for Energy Efficiency Resources (DEER) Update Study, Final Report, Itron, Inc. Vancouver, WA. December 2005. Available at www.calmac.org/publications/2004-05_DEER_Update_Final_Report-Wo.pdf

A computer-generated sketch of the Assembly Building prototype is shown below.



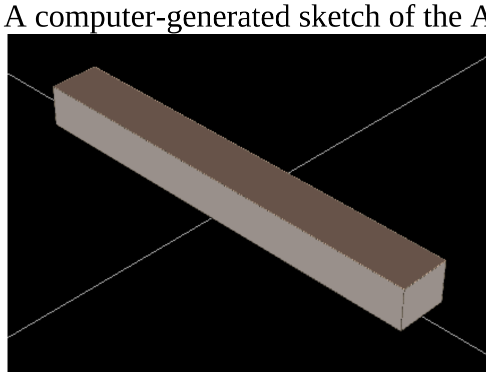
Auto Repair

A prototypical building energy simulation model for an auto repair building was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the prototype are summarized below.

AUTO REPAIR PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	5150 square feet
Number of floors	1
Wall construction and R-value	Concrete block, R-7.5
Roof construction and R-value	Wood frame with built-up roof, R-13,5
Glazing type	Double pane clear; SHGC = ,74 U-value = 0,72
Lighting power density	2.2 W/SF
Plug load density	1.2 W/SF
Operating hours	Mon-Sun: 9am – 9pm
HVAC system type	Packaged single zone, no economizer
HVAC system size	280 SF/ton
Thermostat set points	Occupied hours: 76 cooling, 72 heating Unoccupied hours: 81 cooling, 67 heating

A computer-generated sketch of the Auto Repair Building prototype is shown below.



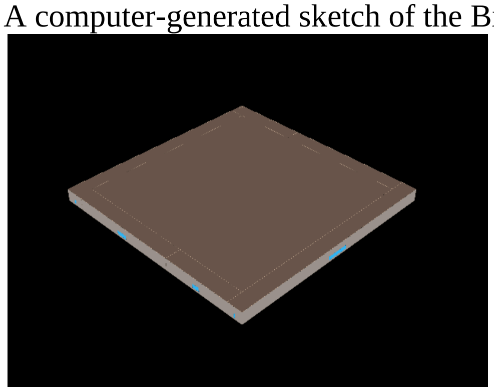
Big Box Retail

A prototypical building energy simulation model for a big box retail building was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the prototype are summarized below.

BIG BOX RETAIL PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	130,500 square feet Sales: 107,339 SF Storage: 11,870 SF Office: 4,683 SF Auto repair: 5,151 SF Kitchen: 1,459 SF
Number of floors	1
Wall construction and R-value	Concrete block with insulation, R-5
Roof construction and R-value	Metal frame with built-up roof, R-12
Glazing type	Single pane clear
Lighting power density	Sales: 3.36 W/SF Storage: 0.88 W/SF Office: 2.2 W/SF Auto repair: 2.15 W/SF Kitchen: 4.3 W/SF
Plug load density	Sales: 1.15 W/SF Storage: 0.23 W/SF Office: 1.73 W/SF Auto repair: 1.15 W/SF Kitchen: 3.23 W/SF
Operating hours	Mon-Sun: 10am – 9pm
HVAC system type	Packaged single zone, no economizer
HVAC system size	230 - 260 SF/ton depending on climate
Thermostat set points	Occupied hours: 76 cooling, 72 heating Unoccupied hours: 79 cooling, 69 heating

A computer-generated sketch of the Big Box Building prototype is shown below.



Community College

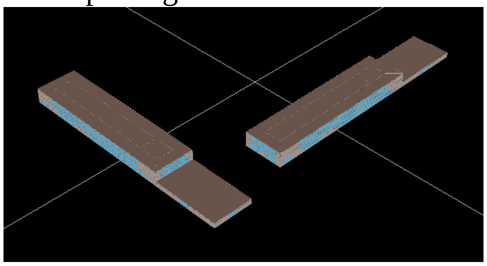
A prototypical building energy simulation model for a community college was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The model is really two identical buildings oriented 90 degrees apart. The characteristics of the prototype are summarized below.

Community College Prototype Building Description

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	2 buildings, 150,000 square feet each; oriented 90° from each other Classroom: 150,825 SF Computer room: 9,625 SF Dining area: 26,250 SF Kitchen: 5,625 SF Office: 70,175 SF Total: 300,000 SF
Number of floors	3
Wall construction and R-value	CMU with brick veneer, plus R-7.5
Roof construction and R-value	Wood frame with built-up roof, R-13.5
Glazing type	Double pane clear, SHGC = 0.73; U-value = 0,72
Lighting power density	Classroom: 3.6 W/SF Computer room: 3.6 W/SF Dining area: 1.5 W/SF Gymnasium: 1.8 W/SF Kitchen: 3.6 W/SF
Plug load density	Classroom: 1.1 W/SF Computer room: 5.5 W/SF Dining area: 0.6 W/SF Gymnasium: 0.6 W/SF Kitchen: 3.3 W/SF
Operating hours	Mon-Fri: 8am – 7pm Sat: 8am – 4pm Sun: closed
HVAC system type	Combination PSZ and built-up with screw chiller and hot water boiler.
HVAC system size	250 SF/ton
Thermostat set points	Occupied hours: 76 cooling, 72 heating Unoccupied hours: 81 cooling, 67 heating
Chiller type	Water cooled and air cooled
Chilled water system type	Variable volume with 2 way control valves,
Chilled water system control	Constant CHW Temp, 45 °F set point
Boiler type	Hot water, 80% efficiency
Hot water system type	Variable volume with 2 way control valves,
Hot water system control	Constant HW Temp, 180 °F set point

Each set of measures was run using each of three different HVAC system configurations: a constant volume reheat system without economizer, a constant volume reheat system with economizer, and a VAV system with economizer. The constant volume reheat system without economizer represents a system with the most heating and cooling operating hours, while the VAV system with economizer represents a system with the least heating and cooling hours. This presents a range of system loads and energy savings for each measure analyzed.

A computer-generated sketch of the Community College Building prototype is shown below.



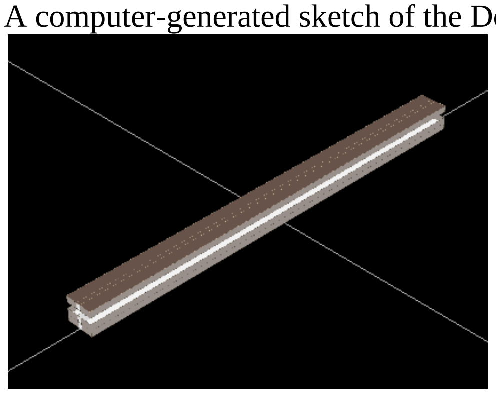
Dormitory

A prototypical building energy simulation model for a university dormitory was developed using the DOE-2.2 building energy simulation program. The dormitory building was extracted from the DEER university prototype and modeled separately. The model consists of two identical buildings oriented 90 degrees apart. The simulations were driven using TMY3 long-term average weather data. The characteristics of the prototype are summarized below.

DORMITORY PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	170,000 square feet
Number of floors	4
Wall construction and R-value	CMU with R-7.5
Roof construction and R-value	Wood frame with built-up roof, R-13.5
Glazing type	Double pane clear; SHGC = 0.73 U-value = 0.72
Lighting power density	Rooms: 0.5 W/SF Corridors and common space: 0.8
Plug load density	Rooms: 0.6 W/SF Corridors and common space: 0.2
Operating hours	24/7 - 365
HVAC system type	Fan coils with centrifugal chiller and hot water boiler
HVAC system size	800 SF/ton
Thermostat set points	Daytime hours: 76 cooling, 72 heating Night setback hours: 81 cooling, 67 heating

A computer-generated sketch of the Dormitory Building prototype is shown below.



Note: The middle floors, since they thermally equivalent, are simulated as a single floor, and the results are multiplied by 2 to represent the energy consumption of the 2 middle floors.

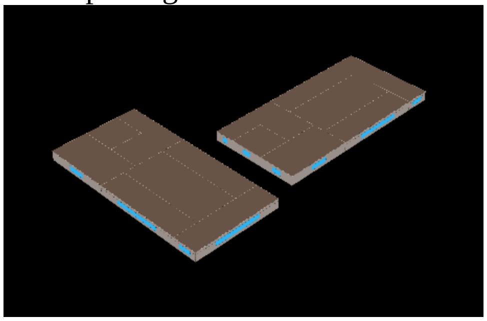
Elementary School

A prototypical building energy simulation model for an elementary school was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The model is really of two identical buildings oriented in two different directions. The characteristics of the prototype are summarized below.

ELEMENTARY SCHOOL PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	2 buildings, 25,000 square feet each; oriented 90° from each other Classroom: 15,750 SF Cafeteria: 3,750 SF Gymnasium: 3,750 SF Kitchen: 1,750 SF
Number of floors	1
Wall construction and R-value	Wood frame with brick veneer, R-5
Roof construction and R-value	Wood frame with built-up roof, R-12
Glazing type	Single pane clear
Lighting power density	Classroom: 4.4 W/SF Cafeteria: 1.7 W/SF Gymnasium: 2.1 W/SF Kitchen: 4.3 W/SF
Plug load density	Classroom: 1.2 W/SF Cafeteria: 0.6 W/SF Gymnasium: 0.6 W/SF Kitchen: 4.2 W/SF
Operating hours	Mon-Fri: 8am – 6pm Sun: 8am – 4pm
HVAC system type	Packaged single zone, no economizer
HVAC system size	160 - 180 SF/ton depending on climate
Thermostat set points	Occupied hours: 76 cooling, 72 heating Unoccupied hours: 79 cooling, 69 heating

A computer-generated sketch of the Elementary School Building prototype is shown below.



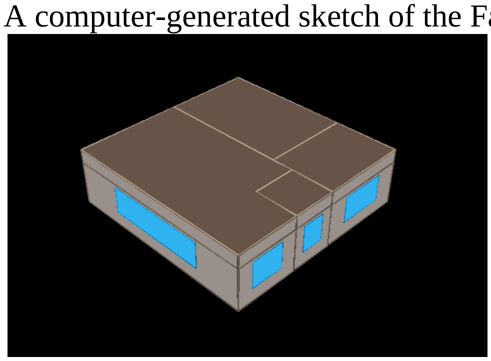
Fast Food Restaurant

A prototypical building energy simulation model for a fast food restaurant was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the prototype are summarized below.

FAST FOOD RESTAURANT PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	2000 square feet 1,000 SF dining 600 SF entry/lobby 300 SF kitchen 100 SF restroom
Number of floors	1
Wall construction and R-value	Concrete block with brick veneer, R-5
Roof construction and R-value	Concrete deck with built-up roof, R-12
Glazing type	Single pane clear
Lighting power density	1.7 W/SF dining 2.5 W/SF entry/lobby 4.3 W/SF kitchen 1.0 W/SF restroom
Plug load density	0.6 W/SF dining 0.6 W/SF entry/lobby 4.3 W/SF kitchen 0.2 W/SF restroom
Operating hours	Mon-Sun: 6am – 11pm
HVAC system type	Packaged single zone, no economizer
HVAC system size	100 – 120 SF/ton depending on climate
Thermostat set points	Occupied hours: 77 cooling, 72 heating Unoccupied hours: 80 cooling, 69 heating

A computer-generated sketch of the Fast Food Building prototype is shown below.



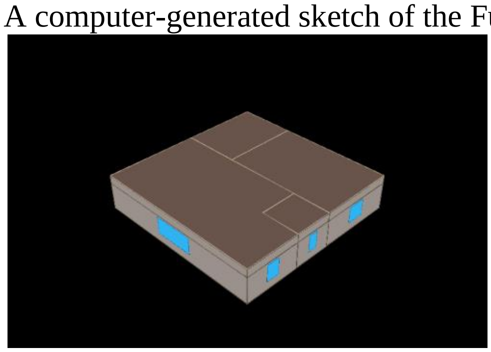
Full-Service Restaurant

A prototypical building energy simulation model for a full-service restaurant was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the full service restaurant prototype are summarized below.

FULL SERVICE RESTAURANT PROTOTYPE DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	2000 square foot dining area 600 square foot entry/reception area 1200 square foot kitchen 200 square foot restrooms
Number of floors	1
Wall construction and R-value	Concrete block with brick veneer, R-5
Roof construction and R-value	Wood frame with built-up roof, R-12
Glazing type	Single pane clear
Lighting power density	Dining area: 1.7 W/SF Entry area: 2.5 W/SF Kitchen: 4.3 W/SF Restrooms: 1.0 W/SF
Plug load density	Dining area: 0.6 W/SF Entry area: 0.6 W/SF Kitchen: 3.1 W/SF Restrooms: 0.2 W/SF
Operating hours	9am – 12am
HVAC system type	Packaged single zone, no economizer
HVAC system size	140 – 160 SF/ton depending on climate
Thermostat set points	Occupied hours: 77 cooling, 72 heating Unoccupied hours: 80 cooling, 69 heating

A computer-generated sketch of the Full-Service Restaurant Building prototype is shown below.



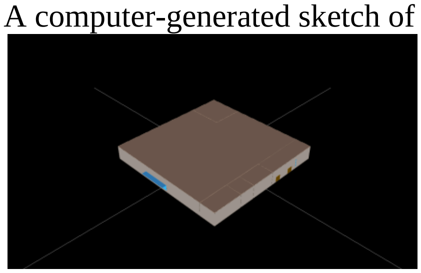
Grocery

A prototypical building energy simulation model for a grocery building was developed using the DOE-2.2R[494] building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the prototype are summarized below.

GROCERY PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	50,000 square feet Sales: 40,000 SF Office and employee lounge: 3,500 SF Dry storage: 2,860 SF 50 °F prep area: 1,268 SF 35 °F walk-in cooler: 1,560 SF - 5 °F walk-in freezer: 812 SF
Number of floors	1
Wall construction and R-value	Concrete block with insulation, R-5
Roof construction and R-value	Metal frame with built-up roof, R-12
Glazing type	Single pane clear
Lighting power density	Sales: 3.36 W/SF Office: 2.2 W/SF Storage: 1.82 W/SF 50°F prep area: 4.3 W/SF 35°F walk-in cooler: 0.9 W/SF - 5°F walk-in freezer: 0.9 W/SF
Equipment power density	Sales: 1.15 W/SF Office: 1.73 W/SF Storage: 0.23 W/SF 50°F prep area: 0.23 W/SF + 36 kBTU/hr process load 35°F walk-in cooler: 0.23 W/SF + 17 kBTU/hr process load - 5°F walk-in freezer: 0.23 W/SF+ 29 kBTU/hr process load
Operating hours	Mon-Sun: 6am – 10pm
HVAC system type	Packaged single zone, no economizer
Refrigeration system type	Air cooled multiplex
Refrigeration system size	Low temperature (-20°F suction temp): 23 compressor ton Medium temperature (18°F suction temp): 45 compressor ton
Refrigeration condenser size	Low temperature: 535 kBTU/hr THR Medium temperature: 756 kBTU/hr THR
Thermostat set points	Occupied hours: 74°F cooling, 70°F heating Unoccupied hours: 79°F cooling, 65°F heating

A computer-generated sketch of the Grocery Building prototype is shown below.



High School

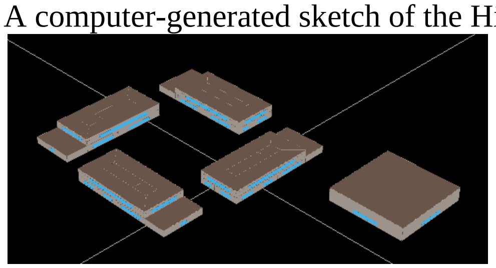
[494] DOE-2.2R is a specialized version of the DOE-2.2 program, designed specifically to model refrigeration systems.

A prototypical building energy simulation model for a high school was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The model is really of four identical buildings oriented in four different directions, with a common gymnasium. The characteristics of the prototype are summarized below.

HIGH SCHOOL PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	4 buildings, 25,000 square feet each; oriented 90° from each other Classroom: 88,200 SF Computer room: 3082 SF Dining area: 22,500 SF Gymnasium: 22.500 SF Kitchen: 10,500 SF Office: 3218 SF Total: 150,000 SF
Number of floors	2
Wall construction and R-value	CMU with brick veneer, plus R-7.5
Roof construction and R-value	Wood frame with built-up roof, R-13.5
Glazing type	Double pane clear, SHGC = 0.73; U-value = 0,72
Lighting power density	Classroom: 3.6 W/SF Computer room: 3.6 W/SF Dining area: 1.5 W/SF Gymnasium: 1.8 W/SF Kitchen: 3.6 W/SF
Plug load density	Classroom: 1.1 W/SF Computer room: 5.5 W/SF Dining area: 0.6 W/SF Gymnasium: 0.6 W/SF Kitchen: 3.3 W/SF
Operating hours	Mon-Fri: 8am – 7pm Sat: 8am – 4pm Sun: closed
HVAC system type	Combination PSZ and built-up with screw chiller and hot water boiler.
HVAC system size	250 SF/ton
Thermostat set points	Occupied hours: 76 cooling, 72 heating Unoccupied hours: 81 cooling, 67 heating

A computer-generated sketch of the High School Building prototype is shown below.



Hospital

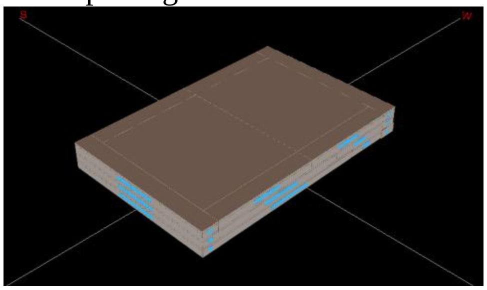
A prototypical building energy simulation model for a large hospital building was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the prototype are summarized below.

LARGE HOSPITAL PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	250,000 square feet
Number of floors	3
Wall construction and R-value	Brick and CMU, R=7.5
Roof construction and R-value	Built-up roof, R-13.5
Glazing type	Multi-pane; Shading-coefficient = 0.84 U-value = 0.72
Lighting power density	Patient rooms: 2.3 W/SF Office: 2.2 W/SF Lab: 4.4 Dining: 1.7 Kitchen and food prep: 4.3
Plug load density	Patient rooms: 1.7 W/SF Office: 1.7 W/SF Lab: 1.7 Dining: 0.6 Kitchen and food prep: 4.6
Operating hours	24/7, 365
HVAC system types	Patient Rooms: 4 pipe fan coil Kitchen: Rooftop DX Remaining space; 1. Central constant volume system with hydronic reheat, without economizer; 2. Central constant volume system with hydronic reheat, with economizer; 3. Central VAV system with hydronic reheat, with economizer
HVAC system size	Based on ASHRAE design day conditions, 10% over-sizing assumed.
Chiller type	Water cooled and air cooled
Chilled water system type	Constant volume with 3 way control valves,
Chilled water system control	Constant CHW Temp, 45 ºF set point
Boiler type	Hot water, 80% efficiency
Hot water system type	Constant volume with 3 way control valves,
Hot water system control	Constant HW Temp, 180 ºF set point
Thermostat set points	Occupied hours: 76 cooling, 72 heating Unoccupied hours: 79 cooling, 69 heating

Each set of measures was run using each of three different HVAC system configurations: a constant volume reheat system without economizer, a constant volume reheat system with economizer, and a VAV system with economizer. The constant volume reheat system without economizer represents a system with the most heating and cooling operating hours, while the VAV system with economizer represents a system with the least heating and cooling hours. This presents a range of system loads and energy savings for each measure analyzed.

A computer-generated sketch of the Large Hospital Building prototype is shown below.



Hotel

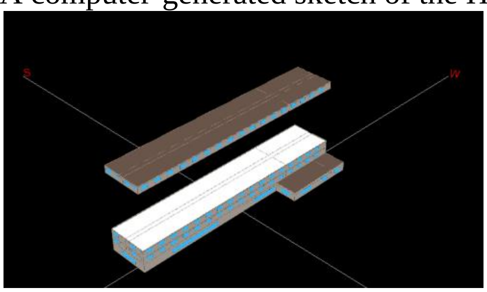
A prototypical building energy simulation model for a hotel building was developed using the DOE-2.2 building energy simulation program. The characteristics of the prototype are summarized below.

HOTEL PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	200,000 square feet total Bar, cocktail lounge – 800 SF Corridor – 20,100 SF Dining Area – 1,250 SF Guest rooms – 160,680 SF Kitchen – 750 SF Laundry – 4,100 SF Lobby – 8,220 Office – 4,100 SF
Number of floors	11
Wall construction and R-value	Block construction, R-7.5
Roof construction and R-value	Wood deck with built-up roof, R-13.5
Glazing type	Multi-pane; Shading-coefficient = 0.84 U-value = 0.72
Lighting power density	Bar, cocktail lounge – 1.7 W/SF Corridor – 1.0 W/SF Dining Area – 1.7 W/SF Guest rooms – 0.6 W/SF Kitchen – 4.3 W/SF Laundry – 1.8 W/SF Lobby – 3.1 W/SF Office – 2.2 W/SF
Plug load density	Bar, cocktail lounge – 1.2 W/SF Corridor – 0.2 W/SF Dining Area – 0.6 W/SF Guest rooms – 0.6 W/SF Kitchen – 3.0 W/SF Laundry – 3.5 W/SF Lobby – 0.6 W/SF Office – 1.7 W/SF
Operating hours	Rooms: 60% occupied 40% unoccupied All others: 24 hr / day
HVAC system type	Central built-up system: All except corridors and rooms

Characteristic	Value
	1. Central constant volume system with perimeter hydronic reheat, without economizer; 2. Central constant volume system with perimeter hydronic reheat, with economizer; 3. Central VAV system with perimeter hydronic reheat, with economizer PTAC (Packaged Terminal Air Conditioner): Guest rooms PSZ: Corridors
HVAC system size	Based on ASHRAE design day conditions, 10% over-sizing assumed.
Minimum outdoor air fraction	Built up system 0.3; PSZ: 0.14; PTAC: 0.11 is typical.
Chiller type	Water cooled and air cooled
Chilled water system type	Constant volume with 3 way control valves,
Chilled water system control	Constant CHW Temp, 45 °F set point
Boiler type	Hot water, 80% efficiency
Hot water system type	Constant volume with 3 way control valves,
Hot water system control	Constant HW Temp, 180 °F set point
Thermostat set points	Occupied hours: 76 cooling, 72 heating Unoccupied hours: 81 cooling, 67 heating

A computer-generated sketch of the Hotel Building prototype is shown below.



Large Office

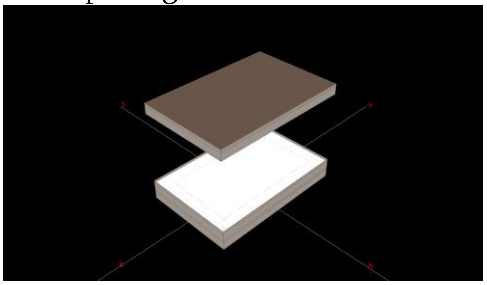
A prototypical building energy simulation model for a large office building was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the prototype are summarized below.

LARGE OFFICE PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	350,000 square feet
Number of floors	10
Wall construction and R-value	Glass curtain wall, R-7.5
Roof construction and R-value	Built-up roof, R-13.5
Glazing type	Multi-pane; Shading-coefficient = 0.84 U-value = 0.72
Lighting power density	Perimeter offices: 1.55 W/SF Core offices: 1.45 W/SF
Plug load density	Perimeter offices: 1.6 W/SF Core offices: 0.7 W/SF
Operating hours	Mon-Sat: 9am – 6pm Sun: Unoccupied
HVAC system types	1. Central constant volume system with hydronic reheat, without economizer; 2. Central constant volume system with hydronic reheat, with economizer; 3. Central VAV system with hydronic reheat, with economizer
HVAC system size	Based on ASHRAE design day conditions, 10% over-sizing assumed.
Chiller type	Water cooled and air cooled
Chilled water system type	Constant volume with 3 way control valves,
Chilled water system control	Constant CHW Temp, 45 °F set point
Boiler type	Hot water, 80% efficiency
Hot water system type	Constant volume with 3 way control valves,
Hot water system control	Constant HW Temp, 180 °F set point
Thermostat set points	Occupied hours: 75 cooling, 70 heating Unoccupied hours: 78 cooling, 67 heating

Each set of measures was run using each of three different HVAC system configurations: a constant volume reheat system without economizer, a constant volume reheat system with economizer, and a VAV system with economizer. The constant volume reheat system without economizer represents a system with the most heating and cooling operating hours, while the VAV system with economizer represents a system with the least heating and cooling hours. This presents a range of system loads and energy savings for each measure analyzed.

A computer-generated sketch of the Large Office Building prototype is shown below.



Note: The middle floors, since they thermally equivalent, are simulated as a single floor, and the results are multiplied by 8 to represent the energy consumption of the eight middle floors.

Large Retail

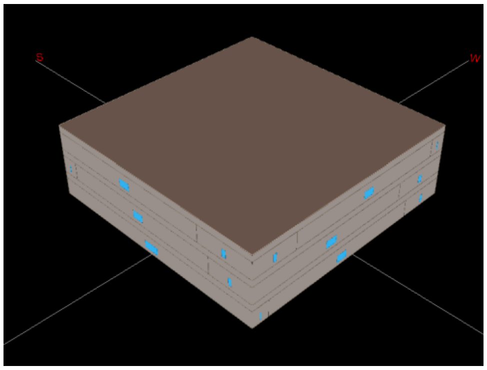
A prototypical building energy simulation model for a large retail building was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the prototype are summarized below.

LARGE RETAIL PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	**Existing (1970s) vintage**
Size	130,000 square feet Sales area: 96,000 SF Storage: 18,000 SF Office: 6,000 SF
Number of floors	3
Wall construction and R-value	Brick and CMU with R-7.5
Roof construction and R-value	Built-up roof, R-13.5
Glazing type	Multi-pane; SHGC= 0.73 U-value = 0.72
Lighting power density	Sales area: 2.8 W/SF Storage: 0.8 W/SF Office: 1.8 W/SF
Plug load density	Sales area: 1.1 W/SF Storage: 0.2 W/SF Office: 1.7 W/SF
Operating hours	Mon-Sat: 9am – 10pm Sun: 9am – 7pm
HVAC system types	1. Central constant volume system with hydronic reheat, without economizer; 2. Central constant volume system with hydronic reheat, with economizer; 3. Central VAV system with hydronic reheat, with economizer
HVAC system size	340 SF/ton
Chiller type	Water cooled and air cooled
Chilled water system type	Variable volume with 2 way control valves,
Chilled water system control	Constant CHW Temp, 45 °F set point
Boiler type	Hot water, 80% efficiency
Hot water system type	Variable volume with 2 way control valves,
Hot water system control	Constant HW Temp, 180 °F set point
Thermostat set points	Occupied hours: 76 cooling, 72 heating Unoccupied hours: 81 cooling, 67 heating

Each set of measures was run using each of three different HVAC system configurations: a constant volume reheat system without economizer, a constant volume reheat system with economizer, and a VAV system with economizer. The constant volume reheat system without economizer represents a system with the most heating and cooling operating hours, while the VAV system with economizer represents a system with the least heating and cooling hours. This presents a range of system loads and energy savings for each measure analyzed.

A computer-generated sketch of the Large Retail Building prototype is shown below.



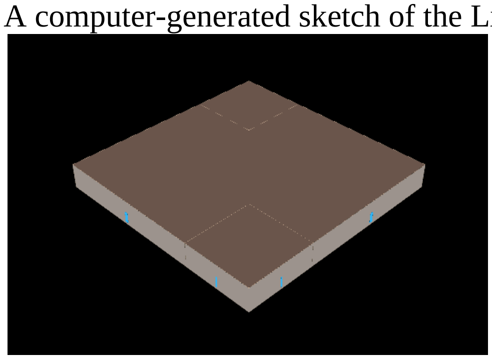
Light Industrial

A prototypical building energy simulation model for a light industrial building was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the prototype are summarized below.

LIGHT INDUSTRIAL PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	100,000 square feet total 80,000 SF factory 20,000 SF warehouse
Number of floors	1
Wall construction and R-value	Concrete block with insulation, R-5
Roof construction and R-value	Concrete deck with built-up roof, R-12
Glazing type	Single pane clear
Lighting power density	Factory – 2.1 W/SF Warehouse – 0.9 W/SF
Plug load density	Factory – 1.2 W/SF Warehouse – 0.2 W/SF
Operating hours	Mon-Fri: 6am – 6pm Sat Sun: Unoccupied
HVAC system type	Packaged single zone, no economizer
HVAC system size	500 - 560 SF/ton depending on climate
Thermostat set points	Occupied hours: 78 cooling, 70 heating Unoccupied hours: 81 cooling, 67 heating

A computer-generated sketch of the Light Industrial Building prototype is shown below.



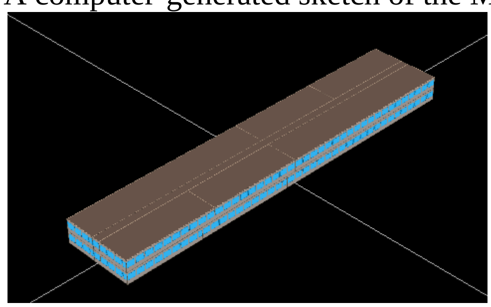
Motel

A prototypical building energy simulation model for a motel was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the prototype are summarized below.

MOTEL PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	30,000 square feet
Number of floors	2
Wall construction and R-value	Frame with R-5
Roof construction and R-value	Wood frame with built-up roof, R-12
Glazing type	Single pane clear; SHGC = .87 U-value = 1.2
Lighting power density	0.6 W/SF
Plug load density	0.6 W/SF
Operating hours	24/7 - 365
HVAC system type	PTAC with electric heat
HVAC system size	540 SF/ton
Thermostat set points	Daytime hours: 76 cooling, 72 heating Night setback hours: 81 cooling, 67 heating

A computer-generated sketch of the Motel Building prototype is shown below.



Refrigerated Warehouse

A prototypical building energy simulation model for a refrigerated warehouse building was developed using the DOE-2.2R[495] building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the prototype are summarized below.

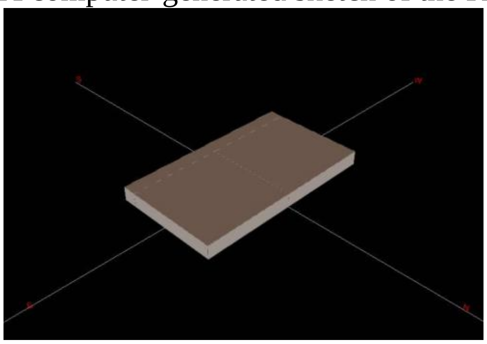
PROTOTYPICAL REFRIGERATED WAREHOUSE MODEL DESCRIPTION

Characteristic	Value
Vintage	New construction
Shape	Rectangular (400 ft by 230 ft)
Floor area	Freezer: 40,000 SF Cooler: 40,000 SF Shipping Dock: 12,000 SF Total: 92,000 SF
Number of floors	1

495 DOE-2.2R is a specialized version of the DOE-2.2 program, designed specifically to model refrigeration systems.

Characteristic	Value
Floor to ceiling height	30 ft
Exterior wall construction	Insulated metal panel
Ext wall R-Value	Cooler and loading dock – R-20; Freezer – R-26

A computer-generated sketch of the Refrigerated Warehouse Building prototype is shown below.



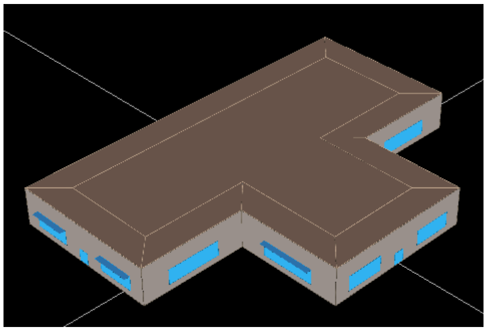
Religious

A prototypical building energy simulation model for a religious worship building was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the prototype are summarized below.

RELIGIOUS WORSHIP PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	11,000 square feet
Number of floors	1
Wall construction and R-value	Brick with R-5
Roof construction and R-value	Wood frame with built-up roof, R-12
Glazing type	Single pane clear; SHGC = .87 U-value = 1.2
Lighting power density	1.7 W/SF
Plug load density	1.2 W/SF
Operating hours	Mon-Sat: 12pm-6pm Sun: 9am – 7pm
HVAC system type	Packaged single zone, no economizer
HVAC system size	250 SF/ton
Thermostat set points	Occupied hours: 76 cooling, 70 heating Unoccupied hours: 82 cooling, 64 heating

A computer-generated sketch of the Religious Building prototype is shown below.



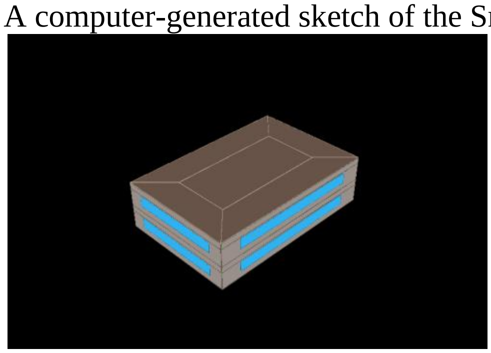
Small Office

A prototypical building energy simulation model for a small office was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the small office prototype are summarized below.

SMALL OFFICE PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	**Existing (1970s) vintage**
Size	10,000 square feet
Number of floors	2
Wall construction and R-value	Wood frame with brick veneer, R-5
Roof construction and R-value	Wood frame with built-up roof, R-12
Glazing type	Single pane clear
Lighting power density	Perimeter offices: 2.2 W/SF Core offices: 1.5 W/SF
Plug load density	Perimeter offices: 1.6 W/SF Core offices: 0.7 W/SF
Operating hours	Mon-Sat: 9am – 6pm Sun: Unoccupied
HVAC system type	Packaged single zone, no economizer
HVAC system size	230 - 245 SF/ton depending on climate
Thermostat set points	Occupied hours: 76 cooling, 72 heating Unoccupied hours: 79 cooling, 69 heating

A computer-generated sketch of the Small Office Building prototype is shown below.



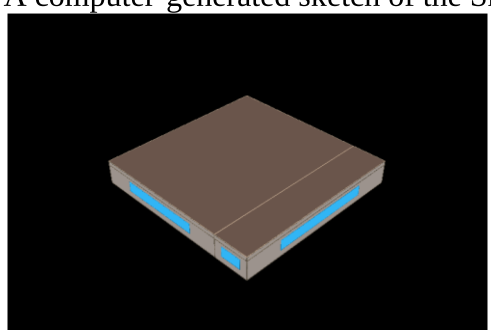
Small Retail

A prototypical building energy simulation model for a small retail building was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The characteristics of the small retail building prototype are summarized below.

SMALL RETAIL PROTOTYPE DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	6400 square foot sales area 1600 square foot storage area 8000 square feet total
Number of floors	1
Wall construction and R-value	Concrete block with brick veneer, R-5
Roof construction and R-value	Wood frame with built-up roof, R-12
Glazing type	Single pane clear
Lighting power density	Sales area: 3.4 W/SF Storage area: 0.9 W/SF
Plug load density	Sales area: 1.2 W/SF Storage area: 0.2 W/SF
Operating hours	10 – 10 Monday-Saturday 10 – 8 Sunday
HVAC system type	Packaged single zone, no economizer
HVAC system size	230 – 250 SF/ton depending on climate
Thermostat set points	Occupied hours: 76 cooling, 72 heating Unoccupied hours: 79 cooling, 69 heating

A computer-generated sketch of the Small Retail Building prototype is shown below.



University

A prototypical building energy simulation model for a university building was developed using the DOE-2.2 building energy simulation program. The simulations were driven using TMY3 long-term average weather data. The model is really four identical buildings oriented 90 degrees apart. The characteristics of the prototype are summarized below.

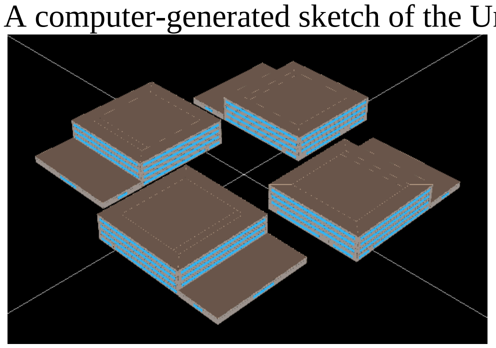
UNIVERSITY PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	4 buildings, 200,000 square feet each; oriented 90° from each other Classroom: 431,160 SF Computer room: 27,540 SF

Characteristic	Value
	Dining area: 24,000 SF Kitchen: 10,500 SF Office: 226,800 SF Total: 800,000 SF
Number of floors	4
Wall construction and R-value	Insulated frame wall with R-7.5
Roof construction and R-value	Wood frame with built-up roof, R-13.5
Glazing type	Double pane clear, SHGC = 0.73; U-value = 0,72
Lighting power density	Classroom: 3.6 W/SF Computer room: 3.6 W/SF Dining area: 1.5 W/SF Office: 2.0 W/SF Kitchen: 3.6 W/SF
Plug load density	Classroom: 1.1 W/SF Computer room: 5.5 W/SF Dining area: 0.6 W/SF Office: 1.6 W/SF Kitchen: 3.3 W/SF
Operating hours	Mon-Fri: 8am – 10pm Sat: 8am – 7pm Sun: closed
HVAC system type	Combination PSZ and built-up with centrifugal chiller and hot water boiler.
HVAC system size	400 SF/ton
Thermostat set points	Occupied hours: 76 cooling, 72 heating Unoccupied hours: 81 cooling, 67 heating
Chiller type	Water cooled and air cooled
Chilled water system type	Variable volume with 2 way control valves,
Chilled water system control	Constant CHW Temp, 45 ^{o}F set point
Boiler type	Hot water, 80% efficiency
Hot water system type	Variable volume with 2 way control valves,
Hot water system control	Constant HW Temp, 180 ^{o}F set point

Each set of measures was run using each of three different HVAC system configurations: a constant volume reheat system without economizer, a constant volume reheat system with economizer, and a VAV system with economizer. The constant volume reheat system without economizer represents a system with the most heating and cooling operating hours, while the VAV system with economizer represents a system with the least heating and cooling hours. This presents a range of system loads and energy savings for each measure analyzed.

A computer-generated sketch of the University Building prototype is shown below.



Warehouse

A prototypical building energy simulation model for a warehouse building was developed using the DOE-2.2 building energy simulation program. The characteristics of the prototype are summarized below.

WAREHOUSE PROTOTYPE BUILDING DESCRIPTION

Characteristic	Value
Vintage	Existing (1970s) vintage
Size	500,000
Number of floors	1
Wall construction and insulation R-value	Concrete block, R-5
Roof construction and insulation R-value	Wood deck with built-up roof, R-12
Glazing type	Multi-pane; Shading-coefficient = 0.84 U-value = 0.72
Lighting power density	0.9 W/SF
Plug load density	0.2 W/SF
Operating hours	Mon-Fri: 7am – 6pm Sat Sun: Unoccupied
HVAC system type	Packaged single zone, no economizer
HVAC system size	Based on ASHRAE design day conditions, 10% over-sizing assumed.
Thermostat set points	Occupied hours: 80 cooling, 68 heating Unoccupied hours: 85 cooling, 63 heating

A computer-generated sketch of the Warehouse Building prototype is shown below.

APPENDIX B

HVAC WEIGHTING FACTORS

As described in the data sources and default value tables, it is permissible to use weighted average values across HVAC system types and building vintages when measure specific data are not available. Program administrators shall submit weighting factors used in their calculations for review and approval by the DPS. The weighting factors presented in this section may be used in lieu of program-specific weighting factors until such data are available.

Weighting factors developed for this section were taken from survey data compiled by the US Energy Information Agency (EIA), as part of the 2005 Residential Energy Consumption Survey (RECS) and the 2003 Commercial Building Energy Consumption Survey (CBECS). RECS survey data were collected specifically for New York state; CBECS data were collected for census division 2 (Middle Atlantic), which includes New York, New Jersey, and Pennsylvania.

SINGLE-FAMILY RESIDENTIAL BUILDING CALCULATIONS

The fractions of total building floor space for the Old and Average vintages are shown below. These data are compiled for building total (conditioned and unconditioned), heated and cooled floor space.

Vintage Weights for Single-family Detached Residential Buildings

	Total	Heated	Cooled
Old	0.441	0.420	0.358
Average	0.559	0.580	0.642

For example, approximately 64% of the cooled floor space is in buildings within the Average vintage, while 36% of the cooled floor space is in the Old vintage. Note, the RECS data did not provide information for new construction. Weighting calculations involving cooling savings should use the cooled floor space weights, while weighting calculations involving heating savings should use the heated floor space weights. Within each building vintage category, the weights by HVAC system type are shown below.

System Type Weights by Vintage for Single-family Detached Residential Buildings

System Type	Old	Average
AC with gas heat	0.474	0.616
Heat Pump	0.000	0.049
AC with electric heat	0.002	0.013
Electric heat only	0.004	0.017
Gas heat only	0.519	0.306
Room AC	0.629	0.371

MULTI-FAMILY RESIDENTIAL BUILDING CALCULATIONS

The fractions of total multi-family low-rise building floor space for the Old and Average vintage are shown below. These data are compiled for building total (conditioned and unconditioned), heated and cooled floor space. Low-rise buildings were identified as buildings with 2-4 units; or 1 or 2 story buildings with 5 or more units.

Vintage Weights for Low-rise Multi-family Residential Buildings

	Total	Heated	Cooled
Old	0.097	0.089	0.134
Average	0.903	0.911	0.866

The fractions of total multi-family high-rise building floor space for the Old and Average vintage are shown below. These data are compiled for building total (conditioned and unconditioned), heated and cooled floor space. High-rise buildings were identified as buildings with 3 or more stories.

Vintage Weights for High-rise Multi-family Residential Buildings

	Total	Heated	Cooled
Old	0.827	0.828	0.712
Average	0.173	0.172	0.288

Note, the RECS data did not provide information for new construction. Weighting calculations involving cooling savings should use the cooled floor space weights, while weighting calculations involving heating savings should use the heated floor space weights. For low-rise building calculations, weights by HVAC system type have been compiled. Within each building vintage category, the weights by HVAC system type are shown below.

HVAC System Type	Old	Average
AC with gas heat	0.542	0.350
Heat Pump	0.000	0.000
AC with electric heat	0.000	0.000
Electric heat only	0.006	0.012
Gas heat only	0.450	0.627
PTAC	0.003	0.012
PTHP	0.000	0.000

Note: The Tech Manual assumes a single HVAC system type for high-rise buildings, thus weighting across HVAC system types is not required.

COMMERCIAL BUILDING CALCULATIONS

Weighting Factors for Commercial Building Calculations

The Tech Manual currently lists energy savings estimates for small commercial buildings for a single vintage and HVAC system type, with the exception of HVAC interactive effects multipliers. Use the weights in the table below for HVAC interactive effects:

System Type Weights for Built-Up HVAC Systems from CBECS

Building Type	AC with gas heat	Heat Pump	AC with electric heat	Electric heat only	Gas heat only
Assembly	0.63	0.08	0.12	0.03	0.14
Auto Repair	0.54	0.08	0.10	0.04	0.24

Big Box	0.66	0.07	0.18	0.02	0.07
Elementary School	0.68	0.11	0.11	0.01	0.08
Fast Food	0.67	0.09	0.18	0.01	0.06
Full Service	0.67	0.09	0.18	0.01	0.06
Grocery	0.66	0.07	0.18	0.02	0.07
Light Industrial	0.46	0.06	0.00	0.10	0.37
Motel	0.46	0.23	0.26	0.02	0.03
Religious	0.57	0.11	0.13	0.03	0.15
Small Office	0.69	0.10	0.19	0.00	0.02
Small Retail	0.66	0.07	0.18	0.02	0.07
Warehouse	0.46	0.06	0.00	0.10	0.37
Other	0.60	0.10	0.14	0.03	0.13

(Note: Some types do not add up to exactly 1.00 due to rounding.)

Savings estimates for large commercial buildings are developed for several HVAC system and chiller type combinations. The CBECS data were analyzed to develop system type weights for these building types. The weighting factors for each of the two HVAC system types constant volume reheat (CV) and variable air volume (VAV) are shown below.

System Type Weights for Built-Up HVAC Systems from CBECS

	Building					
System Type	**Hospital**	**Office**	**Education**	**Lodging**	**Retail**	**Other**
CV	0.16	0.14	0.31	1.00	0.16	0.35
VAV	0.84	0.86	0.69	0.00	0.84	0.65

Record of Revision

Record of Revision Number	Issue Date

[496] Some of the EULs of LED lighting products are based on the listing found in the Qualified Products List by the Design Light Consortium (DLC) at 35,000 or 50,000 hours, according to the appropriate Application Category as specified in the DLC"s *Product Qualification Criteria, Technical Requirement Table* version 2.0 or higher. The EUL of other LED products are based on the listing found in the *Energy Star Qualified Fixture List*, according to the appropriate luminaire classification as specified in the *Energy Star Program requirements for Luminaires*, version 1.2. The total hours are divided by estimated annual use, but capped at 15 years regardless (consistent with C&I redecoration and business type change patterns.)

Poughkeepsie	-1.2	0.005	5.6

Impact per kSF square foot

City	Vintage	kWh/ 1000 SF	kW/ 1,000SF	Therm/ 1,000SF
Albany	Old	73	0.128	30
Albany	Average	22	0.099	16
Binghamton	Old	64	0.116	33
Binghamton	Average	11	0.085	17
Buffalo	Old	68	0.101	34
Buffalo	Average	20	0.079	19
Massena	Old	66	0.127	30
Massena	Average	20	0.098	17
NYC	Old	118	0.119	29
NYC	Average	56	0.098	17
Syracuse	Old	73	0.195	29
Syracuse	Average	23	0.092	16

Baseline infiltration rate for old building is 1.0 ACH.
Baseline infiltration rate for average building is 0.5 ACH.
Energy savings based on a 15% reduction.

APPENDIX G

EQUIVALENT FULL-LOAD HOURS (EFLH), FOR HEATING AND COOLING

Analysis used to develop parameters for the energy and demand savings calculations are based on DOE-2.2 simulations of a set of prototypical residential buildings. The prototypical simulation models were derived from the residential building prototypes used in the California Database for Energy Efficiency Resources (DEER)[498] study, with adjustments made for local building practices and climate.

Four separate models were created to represent general vintages of buildings:

1. Built prior to 1940, uninsulated masonry buildings. This vintage is referred to as "Pre-war uninsulated brick "

2. Built prior to 1979 when the NYS Energy Code (known as the Energy Conservation Construction Code of New York State – ECCCNYS) went into effect, poorly insulated wood-frame buildings This vintage is referred to as "Prior to 1979"

3. Built from 1979 through 2006, with insulation conforming to 1980s era building codes (1979 ECCCNYS.) This vintage is referred to as "From 1979 through 2006."

4. Built from 2007 through the present, new construction with insulation conforming to the 2007 ECCCNYS for residential buildings and the New York City Energy Conservative Construction Code (if applicable.) This vintage is referred to as "From 2007 through the present."

Heating equivalent full-load hours for residential buildings were originally calculated from a DOE-2.2 simulation of prototypical residential buildings. The prototype building characteristics are described in Appendix A. The revised heating EFLH are shown below:[499]

SINGLE-FAMILY DETACHED COOLING EFLH BY VINTAGE AND CITY

City	Old	Average	New
Albany	322	310	279
Binghamton	199	197	158
Buffalo	334	322	276
Massena	258	250	210
Poughkeepsie	496	470	464
NYC	670	649	630
Syracuse	310	296	268

MULTI-FAMILY LOW-RISE COOLING EFLH BY VINTAGE AND CITY

---

498 2004-2005 Database for Energy Efficiency Resources (DEER) Update Study, Final Report, Itron, Inc. Vancouver, WA. December 2005. Available at www.calmac.org/publications/2004-05_DEER_Update_Final_Report-Wo.pdf

499 The original EFLH numbers have been adjusted according to the recommendations contained in the statewide evaluation performed by Opinion Dynamics, New York Statewide Residential Gas High-Efficiency Heating Equipment Programs – Evaluation of 2009-2011 Programs, August 2014. Recommendations regarding EFLH hours located on page 81.

City	Prior to 1979	From 1979 Through 2006	From 2007 Through the Present
Albany	286	295	279
Binghamton	217	219	210
Buffalo	270	274	256
Massena	230	228	218
NYC	507	550	562
Poughkeepsie	397	423	421
Syracuse	265	284	297

MULTI-FAMILY HIGH-RISE COOLING EFLH BY VINTAGE AND CITY[500]

City	Prior to 1979	From 1979 Through 2006	From 2007 Through the Present
Albany	594	647	782
Binghamton	479	539	684
Buffalo	572	637	773
Massena	532	571	668
NYC	793	843	954
Poughkeepsie	626	669	812
Syracuse	592	665	845

SINGLE-FAMILY DETACHED HEATING EFLH BY VINTAGE AND CITY

City	Old	Average	New
Albany	1,042	978	925
Binghamton	1,086	1,029	963
Buffalo	1,072	1,032	957
Massena	1,125	1,061	1,009
NYC	867	786	725
Poughkeepsie	931	862	807
Syracuse	1,098	1,042	972

[500] Note, there are no cooling values for the "Pre-war uninsulated brick vintage, due to a typical lack of any central cooling. This vintage assumes one room air conditioner (RAC) within the unit. For the savings calculation method, see the Air Conditioner – Room (RAC) measure listed in the Single and Multi-family Residential Measures section of this manual.

MULTI-FAMILY LOW-RISE HEATING EFLH BY VINTAGE AND CITY

City	Pre-war uninsulated brick	Prior to 1979	From 1979 Through 2006	From 2007 Through the Present
Albany	1,111	1,030	1,012	729
Binghamton	1,397	1,320	1,245	899
Buffalo	1,281	1,219	1,215	883
Massena	1,433	1,306	1,326	964
NYC[501]	999	757	723	503
Poughkeepsie	857	894	868	616
Syracuse	1,395	1,175	1,206	845

MULTI-FAMILY HIGH-RISE HEATING EFLH BY VINTAGE AND CITY

City	Pre-war uninsulated brick	Prior to 1979	From 1979 Through 2006	From 2007 Through the Present
Albany	975	786	626	363
Binghamton	1,102	1,006	831	484
Buffalo	1,181	966	813	471
Massena	1,111	1,016	873	552
NYC[502]	1,012	526	395	219
Poughkeepsie	922	656	510	291
Syracuse	1,063	889	787	474

[501] NYC building only incorporates a higher thermostatic set point of 73°F instead of 70 °F based on reported data. The other cities listed use the thermostatic set-point of 7070^0 F. Overheating in Hot Water and Steam-Heated Multi-family Buildings, U.S. Dept. of Energy, Jordan Dentz, Kapil Varshney and Hugh Henderson, October 2013.

APPENDIX K

VARIABLE FREQUENCY DRIVES

Unit energy (kWh) savings for VFDs were estimated by building type, HVAC type and city using DOE-2.2 simulations of the prototype buildings with built-up HVAC systems. The simulations were run for each of the three built-up system types (CV no economizer, CV with economizer, and VAV with economizer) and the results were weighted according to the HVAC system weights shown in Appendix B. The results for each prototype are shown by measure and location below:

For the city, measure, and building type combinations not addressed above, use data supplied by National Grid shown below. The unit savings estimates are based on data developed by NSTAR for the Massachusetts TRM[504]. These values were trued up to National Grid evaluation studies by computing the ratio of the savings by VFD application from the National Grid Massachusetts Energy Initiative program evaluation to the average value by application across the NSTAR data.

[504] NSTAR VFD savings taken from Chan, T. *Formulation of a Prescriptive Incentive for the VFD and Motors and VFD Impact Tables at NSTAR*, June, 2010

This adjustment factor was then applied to each of the NSTAR values. The adjusted savings are shown below.

Measure Unit Savings (kWh/hp)

Building	Exh fan	CT fan	CHW pump	Boiler FW pump	HW pump	MAF	Return fan	Supply fan	WLHP circ pump
University/College	2,011			1,788		1,976			1,594
Elm/HSchool	1,968			1,492		2,088			1,334
Multi-Family	1,768			1,806		1,892	902	1,025	1,934
Hotel/Motel	1,740			1694		2,067			1,788
Health	1,863			1812		1,842			1,912
Warehouse	1,828	195	199	1,545	934	1,982	823	936	1,468
Restaurant	1,899	424	381	1,526	916	1,613	936	1,059	1,845
Retail	1,707			1,504		1,469			1,561

APPENDIX L

MINIMUM MOTOR EFFICIENCY – EISA STANDARD

The Energy Independence and Security Act (EISA) of 2007 established NEMA Premium as the new standard for electric motor efficiency, effective December 2010. The energy savings baseline efficiency for all normal replacement motors rebated after the new standards take effect is shown below:

NEMA MG-1 Table 12-12 Full-Load Efficiencies for 60 Hz NEMA Premium® Efficient Electric Motors Rated 600 Volts or less (Random Wound)

Motor Horsepower	Nominal Full-Load Efficiency

APPENDIX M

GUIDELINES FOR EARLY REPLACEMENT CONDITION

Getting Started

The full manual, beginning in Section 2, explains the concepts of the tables and their use, and the choices offered to PAs. It also contains various instructions on such matters as data retention and the tracking database. This first section contains the immediate directions to get a quick start on the simplest case. These tables can only be used regarding the proposed replacement of equipment that has not reached its prescribed Effective Useful Life (EUL). Two other conditions are pertinent to use of this page:

The PA accepts agrees to use the assumptions for each measure regarding the typical relationship between incremental costs and savings and the full costs and savings of replacing the older (but pre-EUL) equipment with the high efficiency equipment promoted by the program. The measures in question are listed in Table M-1 *without* an "a" or a "b" superscript.

If these conditions are met, the fundamental steps for calculation would be as follows:

- Calculate the full costs of replacing the old equipment with the program measure, including labor.
- Calculate the full first year savings of the program measure using the existing equipment as the baseline, assume such savings through the EUL of the new equipment, monetize the savings per the prescribed annual Long Run Avoided Costs (LRACs) estimates, and calculate the present value of this stream of monetized savings using Staff's discount rate. This present value is referred to herein as the Inflated Benefits.[505]
- Estimate the remaining useful life (RUL) of the old equipment in place.
- Turn to the measure-specific costs and savings tables of the measure in question (the measures are grouped by the EUL on Table M-1).
- Go down each table to the row for the estimated RUL and find the percentage adjustment factor in the column for the measure.
- Multiply the Inflated Benefits by the benefits factor.
- Multiply the full costs by the costs factor.
- For Total Resources Cost (TRC) analysis, use the two products from steps 6 and 7.
- For first year savings to report against approved program goals, use the full savings.

Introduction

In the EEPS Order issued on October 18, 2010 (p.9),[506] the Commission stated, regarding TRC analysis of early replacements in individual projects, that it was ". . . directing Staff to develop a new approach, based on the dual baseline approach, which provides consistency between the treatment of savings and costs. The Director of the Office of Energy Efficiency and Environment is directed to compile and provide simplifying lookup tables, which provide early

[505] "Inflated Benefits" is simply a concept designed to be an intermediate step in the computation of estimated dual baseline benefits, using the tables in this Appendix. It does not imply an assumption that the old equipment, absent the program, would have continued in use through the life of the new equipment.

[506] Case 07-M-0548, Order Approving Consolidation and Revision of Technical Manuals (issued October 18, 2010).

replacement method energy savings consistent with the dual baseline concept as an attachment to the consolidated Technical Manual (TM)." Staff was also directed "to develop a consistent cost estimation approach which reflects the concept that the costs of making a high efficiency early replacement will avoid an end-of useful-life replacement with minimally code compliant equipment."

Early Replacement vs. Normal Replacement

Early replacement is defined in the Order as the replacement of equipment before it reaches its Effective Useful Life (EUL), whereas end-of-life or normal replacement refers to the replacement of equipment that has reached or passed the end of its measure-prescribed EUL. The crucial difference between end-of-life replacement and early replacement is that end-of-life/normal uses "incremental" costs and savings while early replacement uses "full" values:

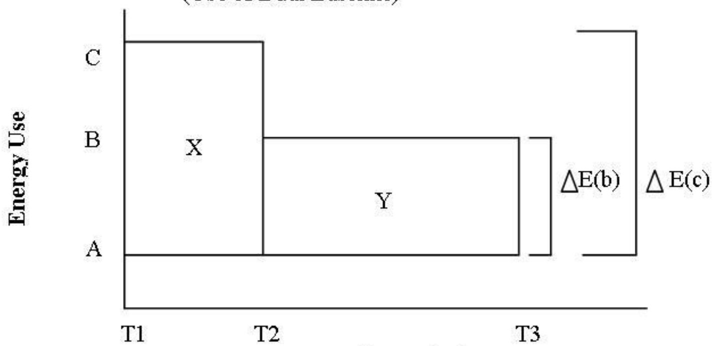
- *Incremental savings* is defined as the annual energy use of the currently-on-the-market standard, minimally compliant equipment minus the annual energy use of the high efficiency equipment subsidized by the program.
- *Full savings* is defined as the annual energy use of the old equipment in place minus the annual energy use of the high efficiency equipment subsidized by the program.
- *Incremental cost* is defined as the full cost of new efficient equipment minus the cost of the currently-on-the-market standard, minimally-compliant equipment, plus the time value penalty (the present value cost of a dollar amount increases with earlier spending, see below).
- *Full cost* is simply the cost (including installation) of the new efficient equipment.

Early replacement not only accelerates savings to the electric grid but also allows PAs to claim greater first-year annual savings toward their annual energy goals because full savings are reported as the first-year savings. *If a PA cannot substantiate that the age of the equipment in place is less than its EUL and therefore a case of early replacement,* the replacement must be screened as normal (end of life) replacement, with the incremental savings reported as the first-year savings toward approved program goals.

In both normal and early replacement conditions, the establishment of the correct baseline is critical in accurately estimating gross energy and demand impacts. However, while the TM addresses the establishment of the baseline for normal replacement conditions, it rarely addresses the establishment of baselines for early replacement conditions. This Appendix M provides two sets of lookup tables and guidance designed to simplify the complex mathematical analysis of dual-baseline cases and reduce PA data needs. The first set of tables, for *typical* early replacement measure conditions as developed by TecMarket Works, reflects data, discussed below, that PAs might find it difficult to obtain. The second set of tables requires PAs to provide these data but still simplifies the calculations.

The standard early replacement condition, illustrated in Figure 1, involves a customer who replaces equipment before it reaches the end of its EUL. That is, the equipment is fully functioning and would continue to function for some period of time; referred to as the remaining useful life (RUL). However, the customer is induced by the program to replace this existing equipment with more efficient equipment. It is assumed that at the end of the RUL, absent the program, the customer would have installed equipment that would meet the existing efficiency code or appliance standard, i.e., equipment that represents the market average efficiency or the efficiency that had become the industry standard (referred to as the *code/standard equipment*).

Figure 1. The Early Replacement Condition (Use of Dual Baseline)



C = Energy use of pre-existing measure
B = Energy use of code/standard measure
A = Energy use of new efficient measure
T1 = Date on which new efficient measure is installed
T2 = Date on which existing measure was expected to have failed
T3 = Date on which the new efficient measure is expected to fail
T3—T1= Expected effective useful life (EUL) of the new efficient measure
T2—T1= Expected remaining useful life (RUL) of the pre-existing measure
T3 - T2 = Expected remaining EUL of the new efficient measure
Δ E(c) = The full savings defined as C - A
Δ E(b) = The incremental savings defined as B - A

Energy savings in this example would consist of two portions. The customer would have experienced the full savings defined by Area **X** (energy use C-A for the RUL period T2-T1). At the end of the RUL, the savings for the period T3-T2 would be reduced to incremental savings defined by area **Y**. To carry out these calculations, information on two (dual) baselines is required, the energy use of the pre-existing equipment and the energy use of code/standard equipment. Information on energy use for the high efficiency equipment provided through the program will also be required.

The cost would also have to be calculated in a manner consistent with early replacement. In normal replacement situations, one would use the incremental cost that is defined as the cost of the new efficient equipment minus the cost of the code/standard equipment. In the early replacement case, the incremental cost is calculated in a slightly different manner. This calculation recognizes that, while the customer purchased efficient equipment with the assistance of the program, it would have purchased code/standard equipment at some time in the future, i.e., at the end of the RUL, had the program not existed.

Thus, one would first have to determine the full cost of the new efficient equipment (including the installation labor) at T1 *and* the full cost of the code/standard equipment (including the installation labor) at T2. The incremental costs would then be calculated as the cost of the new efficient equipment minus the present value (PV) of the cost that is avoided in the future for the code/standard equipment. Figure 2 presents a case in which the RUL is 4 years and, absent the program, the code/standard equipment would have been installed in the fifth year. This calculation differs from the normal/end of life replacement incremental cost in adding the time value of money for spending earlier.

Figure 1. Incremental Cost Calculation for an Early Replacement of Equipment with an RUL of Four Years

Year	PV with Program	PV without Program
1	Full cost of high efficient equipment	0
2	0	0
3	0	0
4	0	0
5	0	Full cost of Code/Standard Equipment

The two key inputs necessary for these calculations, the energy use and the cost of the code/standard equipment, may not be readily available to PA field staff and are subject to change before the end of the equipment's RUL in the absence of a program. Note that the first set of tables in this Appendix M is based on current codes and standards. If a PA can document the needed energy use and cost data, it can choose to use the second set of tables. Both sets of tables are based on a "ratio approach".

The Ratio Approach to the Dual Baseline with the Lookup Tables

This approach focuses on the ratio of incremental savings to full savings[507] and the ratio of incremental costs to full costs. These ratios, shown at the top of the attached tables, determine the factors that PAs can use to adjust the savings and cost data they do have. The first set of tables, the measure-specific set, allows the early replacement calculations to be performed in a manner that only requires the program administrator to have the Remaining Useful Life (RUL) of the equipment in place and the full savings and costs of the project. The ratios in the first set of tables (M-2 through M-19) were developed by TecMarket Works. The second set of tables (M-29 through M-38), the non-measure-specific set, requires the program administrators to provide their own incremental costs and savings ratios (based on the code/standard equipment). To use the second set of tables, PAs must match ratios that they have calculated to corresponding ratios in the tables.

The source of these two ratios for the first set of tables is the Database for Energy Efficient Resources (DEER), most recently updated by Itron for the California Public Utility Commission in 2009. Among other things, DEER contains energy use and costs for selected energy-efficient technologies and equipment in the residential and nonresidential sectors. DEER also contains the same information for typical equipment, those commonly installed in the marketplace.

To use either set of tables PAs will need to calculate the first-year annual savings as the annual energy use of the old equipment in place minus the annual energy use of the high efficiency equipment (the full savings). These full savings are then counted for each year of the EUL as is

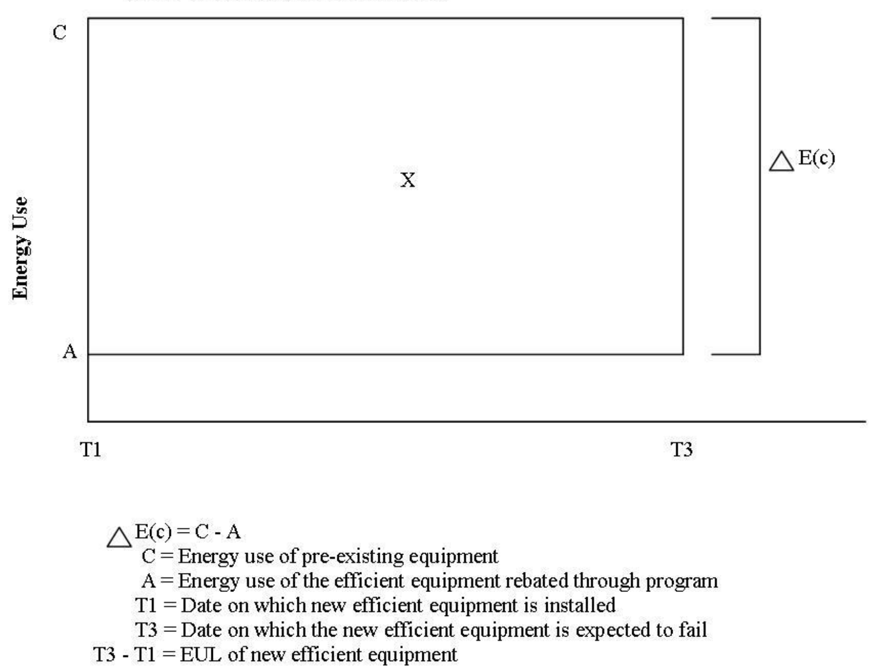
[507] The savings values ratios are not lifecycle present values but are rather the line segments in Figure 1 on the vertical axis: (B – A) divided by (C – A).

represented as area *X* in Figure 3. For each year of the EUL (T3 – T1) of the new equipment, the full kWh or therm savings are converted to dollar benefits by multiplying them by the Commission's avoided costs estimates for that year. As a preliminary step in using the tables, the PAs will calculate this "inflated lifecycle benefits" as the present value of the stream of full savings benefits for the EUL of the new equipment.

In cases of early replacement under the ratio approach, it is these inflated lifecycle benefits that must be adjusted using the appropriate *inflated lifecycle benefits adjustment factor*. For a given measure with a given EUL, RUL and ratio of incremental savings to full savings, the inflated lifecycle benefits adjustment factor is the ratio (presented as a percentage) of the present value of the dual baseline lifecycle benefits (X+Y) illustrated in Figure 1 to the present value of the inflated lifecycle benefits illustrated in Figure 3.

PAs can obtain these factors from either the set of DEER-based tables or from the set of PA-based tables if a PA can calculate its own incremental savings to full savings ratios.

Figure 3. Inflated Lifecycle Benefits



Under the Commission requirement of consistent treatment of savings and costs, the full costs[508] must also be adjusted downward. PAs can obtain the *full cost adjustment factors* from either the DEER-based Tables based on typical ratios of incremental cost to full cost or from the PA-based Tables if a PA can calculate its own incremental cost to full cost ratios. The DEER-based set of lookup tables runs from M-2 through M-28. Of these, M-2 through M-10 cover benefits, M-11 through M-19 costs, and M-20 through M-28 adjusted EULs. The PA-based set of lookup tables

508 Full costs include the capital cost of the new efficient equipment plus installation cost.

runs from M-29 through M-47. Of these, M-29 through M-37 cover benefits, M-38 all costs (only the RUL matters, not the EUL), and M-39 through M-47adjusted EULs.

DEER-Based Look-Up Tables

The first set of tables includes look-up tables M-2 through M-10, which present the *Inflated Lifecycle Benefit Adjustment Factors*. The tables are based primarily on data contained in the California 2009 DEER. For each qualified equipment type, the median ratio of incremental savings to the full savings was calculated. These ratios along with the RULs, ranging from 1 year to the EUL minus 1 year, are shown in the look-up tables and are used to derive the factors needed to adjust the inflated lifecycle benefits.

Tables M-11 through M-19 present the *full cost adjustment factors,* for the same equipment addressed in Tables M-2 through M-10, for the same RUL ranges. For each qualified equipment type, the median ratio of incremental costs to the full costs was calculated.

To use these tables of typical ratios, a PA must have gathered the following four pieces of information:

- the EUL of the new efficient equipment,
- the RUL of the old equipment in place,
- the full savings of the equipment (annual energy use of the old equipment in place minus the annual energy of the high efficiency equipment supported by the program), and
- the full costs (including installation)

The EUL for a given measure is obtained from Table M-1, which is a compilation of the EULs for all the relevant measures in the consolidated Technical Manual effective January 1, 2011 that could qualify for early replacement[509]. The RUL[510], the full savings, and the full costs are provided by the program implementer. Note that documentation for PA estimates of these data must be retained for possible Staff review. Table M-1 also presents the normal replacement baseline equipment against which each of the 29 measures covered in this table is compared. Note that the lookup tables apply only to the 23 measures without an ***a*** or ***b*** designation in Table M-1.

Table M-1. Early Replacement Measures, EULs, and Baselines

[509] Early replacement is inappropriate for such equipment as wall insulation, right sizing, setback thermostats, and sub-metering since nothing is being replaced. Lighting equipment has also been excluded since it is expected to be treated as pre-qualified.

[510] Upon request, Staff will provide a suggested questionnaire to assist in the determination of the RUL.

Measures	EUL	Normal Replacement Baseline
Heat Pump Water Heater: Residential	10	Code Electric Storage Water Heater
Room Air Conditioner: Residential	10	EPACT Room Air Conditioner
Clothes Washer: Single Family: Residential	11	EPACT Clothes Washer
ENERGY STAR Dishwashers: Residential	11	EPACT Dishwasher
Water Heater: Gas: Residential	11	Code Gas Storage Water Heater
Energy Star Dehumidifier: Residential[a]	12	Standard Efficiency Dehumidifier
Refrigerators: Nonresidential	12	EPACT Refrigerator
Indirect Water Heaters: Residential	13	Code Gas Storage Water Heater
Water Heater: Electric: Residential	13	Code Electric Storage Water Heater
Clothes Washer: Multi-Family Residential	14	EPACT Clothes Washer
Air Compressor Upgrade: Nonresidential	15	Standard Efficiency Rotary Screw Compressor
Central Air Conditioning: Residential	15	Code Central AC with gas heat
Central Air Source Heat Pumps: Residential	15	Code Central Air Source Heat Pump
Cool Roof: Nonresidential[a]	15	Standard Roof
Cooling Tower: Nonresidential[a]	15	Standard Efficiency Cooling Tower
Efficient Air-Cooled Refrigeration Condenser: Nonresidential[a]	15	Standard Efficiency Refrigeration Condenser
Indirect Water Heaters: Nonresidential	15	Code Gas Storage Water Heater
Motors: Nonresidential[b]	15	EISA Minimum Efficiency Motor
Packaged Air Conditioners (Central AC): Nonresidential	15	Code Packaged Air Conditioner
Packaged Air Source Heat Pumps (CAC Cooling Only): Nonresidenti	15	Code Packaged Air Source Heat Pump
Water Heaters: Nonresidential (Gas & Electric)	15	Code Storage Water Heater
Refrigerators: Residential	17	EPACT Refrigerator
Chillers: Nonresidential	20	Code Chiller
Gas Furnaces and Boilers: Nonresidential	20	Code Furnace and Boiler
High Efficiency Gas Furnaces: Residential	20	Code Furnace
High Performance Glazing: Nonresidential[b]	20	Code Glazing
High Performance Windows (Gas Heating Only): Residential	20	Code Window
Instantaneous Water Heater: Residential	20	Code Storage Water Heater
Gas Boilers: Residential	25	Code Boiler

EPACT refers to efficiency standards promulgated by the Energy Policy and Conservation Act of 2005

EISA refers to efficiency standards promulgated by the Energy Independence and Security Act of 2007

Code refers to New York State Construction codes, which reference ASHRAE standards.

For measures assigned an **a**, the efficiency of the old in place unit is still the common practice or no new standards have been adopted, i.e., the baseline for the full savings and the incremental savings are the same. As a result, the ratio of incremental to full savings is near 1.0, meaning that a PA can claim the full savings for the entire EUL of the new equipment (areas X and Y in Figure 4). Therefore, the lookup tables do not apply.

For these measures assigned a **b**, the high efficiency equipment subsidized by the program is consistent with current code or standards. For these measures, the incremental savings are zero and thus the ratio of incremental to full savings is 0.0.This means that a PA can claim full savings for only the RUL (area X in Figure 5), after which the high-efficiency replacement would have occurred anyway. Therefore, the lookup tables do not apply.

Figure 4. Efficiency of the Old In Place Unit Is Still the Common Practice Or No New Standards

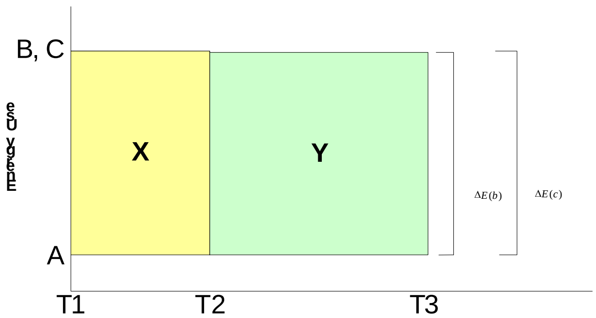


Figure 5. High Efficiency Equipment Subsidized by the Program Is Consistent with Current Code Or Standards

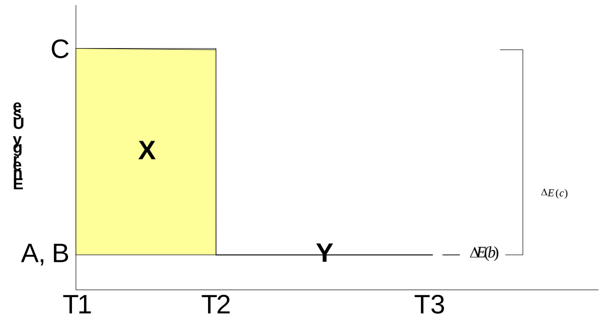


$\Delta E(c)$ = C - A
$\Delta E(b)$ = B - A
C = Energy use of pre-existing equipment
B = Energy use of equipment that meets code
A = Energy use of the efficient equipment rebated through program
T1 = Date on which new efficient equipment is installed
T2 = Date on which existing equipment was expected to have failed
T3= Date on which the new efficient equipment is expected to fail
T3 – T1 = Expected effective useful life (EUL) of the new efficient equipment
T2 – T1 = Expected remaining useful life (RUL) of the pre-existing equipment
T3 – T2 = Expected remaining EUL of the new efficient equipment

After obtaining the four pieces of information listed above, the program implementer can determine the appropriate inflated lifecycle benefits adjustment factor by which to multiply the inflated lifecycle benefits and the full cost adjustment factor by which to multiply the full costs. These adjusted inflated lifecycle benefits and adjusted full costs are to be used in the TRC ratio in the screening of measures in specific projects.

4.1.1 Table Organization

The DEER-Based Tables are divided into two groups:

- Inflated Lifecycle Benefit Adjustment Factors (Tables M-2 through M-10)
- Full-Cost Adjustment Factor (Tables M-11 through M-19)

Each set of tables addresses the same 23 measures or varieties of measures grouped by the EUL.

In each table, the left *column* contains the RULs from 1 year through the EUL minus 1 year. For example, Table M-5 presents Inflated Lifecycle Benefit Adjustment Factors for measures with an EUL of 15 years. Therefore, Table M-5 contains RULs from 1 through 14.

- The *first row* of each table contains the names of each measure addressed in the table.
- The *second row* of each table indicates whether the measure is residential, non-residential or both.
- The *third row* of each table lists the median ratio associated with each measure. For Tables M-2 through M-10 and Tables M-20 through M-28, the ratio is the ratio of the incremental savings to the full savings for each measure. For Tables M-11 through M-19, the ratio is the ratio of the incremental costs to the full costs for each measure.

The remaining *cells* in the matrix contain:

- For Tables M-2 through M-10, the cells contain the Inflated Lifecycle Benefit Adjustment Factors
- For Tables M-11 through M-19, the cells contain the Full-Cost Adjustment Factors

4.1.2 Example

Consider the following example for a group of five measures, residential and non-residential air conditioners (central ACs/packaged units) covering four levels of efficiency, each with an EUL of 15 years:

- non-residential domestic electric water heaters (service hot water),
- non-residential domestic gas water heaters,
- non-residential indirect water heaters, and
- non-residential air compressors.

Table M-5 presents the inflated lifecycle benefits adjustment factors for these five measures. For central air conditioners, the program implementer must determine the SEER of the new efficient unit, estimate the RUL for the old unit in place, and select the appropriate lifecycle benefits adjustment factor. For example, if the SEER of the new efficient unit is 17 and the estimated RUL is 4 years, Table M-5 shows that the *inflated lifecycle benefits adjustment factor* is 0.63. Thus, the inflated lifecycle benefits should be multiplied by 0.63.

For a central air conditioner with a SEER of 17 and an estimated RUL of 4 years, Table M-14 shows that the *full-cost adjustment factor* is 0.44. Thus, the full cost of the new efficient central air conditioner should be multiplied by the full-cost adjustment factor of 0.44.

4.1.3 Trends on the Lookup Tables and Calculation of Ratios

This section discusses the directions in which RULs and the savings and costs ratios affect the adjustment factors, and illustrates how the ratios are calculated.

- *Tables M-2 through M-10*: The longer the RUL is, the larger the share of the inflated lifecycle benefits that a PA can claim. Also, the greater the ratio of incremental savings to full savings; the larger the share of the inflated lifecycle benefits that a PA can claim. Consider the following example of equipment with an EUL of 10 years and annual kWh use of 2,000 kWh that is removed in its 6^{th} year (RUL=4 years) and replaced with an energy efficient version of the equipment with an annual kWh use of 1,400 kWh. The full savings are 600 kWh (2,000 - 1,400). It is assumed that in four years the customer would have installed equipment that, at a minimum, met the current efficiency code of annual energy use. The ratio will change depending on the efficiency of the code/standard equipment:

    - If the kWh use associated with code/standard is 1,600 kWh, then the incremental savings = (1,600 – 1,400) or 200 and the ratio = (200/600) or 0.33.

    - If the kWh use associated with code/standard is 1800 kWh, then the incremental savings = (1,800 – 1,400) or 400 and the ratio = (400/600) or 0.67.

A less strict code (one that allows higher consumption) allows a PA to claim a larger share of the inflated lifecycle benefits. In other words, the higher the kWh use associated with the code/standard equipment, the more the program is accomplishing in avoiding standard equipment.

- *Tables M-11 through M-19*: The longer the RUL is, the larger the share of the unadjusted costs for a PA to include (larger time value penalty). Also, the greater the ratio of incremental costs to full costs is, the larger the share of the unadjusted costs for a PA to include. Continuing with the above example, assume that the full cost of the energy efficient equipment is $2,000. It is assumed that in four years the customer would have installed code/standard equipment. The ratio will change depending on the cost of the code/standard equipment:
    - If the full cost of the minimally compliant equipment is $1,400, then the incremental cost = $600 and the ratio = ($600/$2,000) or 0.30.
    - If the full cost of the minimally compliant equipment is $1,800, then the incremental cost = $200 and the ratio = ($200/$2,000) or 0.10.
- The higher cost of the minimally compliant equipment, which lowers the incremental cost, allows a PA to take into account a smaller portion of the full cost of the efficient measure when calculating a TRC. In other words, the higher the cost of the minimally compliant equipment that the customer would have incurred without the program, the lower the cost of the program.

4.2. PA-Based Look-Up Tables

If a PA is able to calculate its own ratio of the incremental savings to full savings and/or the ratio of incremental costs to full cost, then they may choose to use the second set of tables. If a PA chooses to use its own savings ratio and/or cost ratio, it should identify the ratio in the appropriate tables (M-29 through M-47) that is closest to the one(s) it developed. These 19 tables are for the most part organized and interpreted in the same manner as Tables M-2 through M-28. The only exceptions are that the ratios range[511] from 0.95 to .05 in increments of 0.05, and there are no measure designations. To use these tables, a PA will still need to gather the same four pieces of information needed to use the first set of tables:

- the EUL of the new efficient equipment,
- the RUL of the old equipment in place,
- the full savings of the equipment (annual energy use of the old equipment in place minus the annual energy of the high efficiency equipment supported by the program), and
- the full costs (including installation)

Additionally, the PA will need documented estimates of incremental costs and savings in order to calculate:

- The ratio of incremental savings to full savings, and/or
- The ratio of incremental costs to full cost

[511] The lookup tables do not apply to measures that have a ratio of *incremental savings to full savings* or a ratio of *incremental costs to full costs* of 1.0 or 0.0 for the same reasons provided earlier in Section 2.1.

Note that all documentation for PA estimates of this data must be retained for Staff review, in accordance with Guidance Document EE-08, dated March 31, 2014. This guidance document can be found at:
www3.dps.ny.gov/W/PSCWeb.nsf/All/31D14D1DDC55FB2185257B240062B398?OpenDocument

Program-Tracking Database Requirements

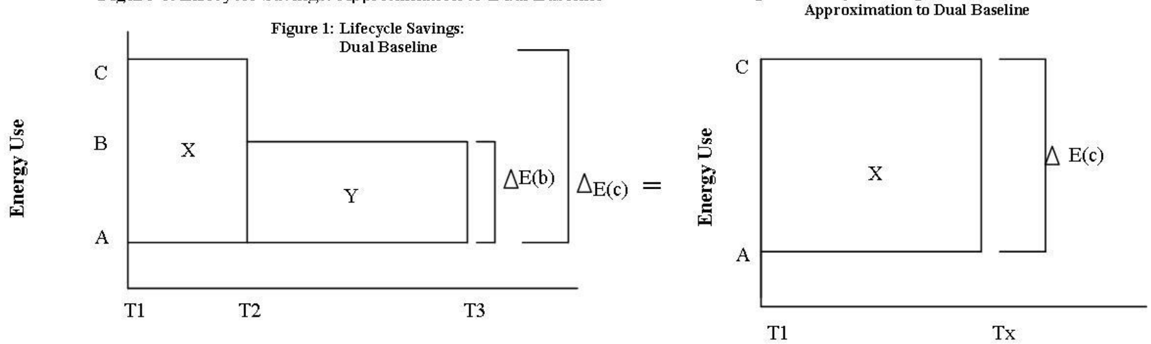
The program tracking databases are maintained by the PAs for the purposes of current reporting and future impact evaluations. The Impact Evaluation section has many fields not used for current reporting. The Department of Public Service hereby adds, for cases of early replacement, six additional required variables.

Type of Installation (TRC Approach)[512] ,

- The *Adjusted Full Savings* (full savings multiplied by the full-savings adjustment factor),
- The *Adjusted Full Cost* (full cost multiplied by the full-cost adjustment factor),
- The Ratio of Incremental Savings to Full Savings,
- The Ratio of Incremental Costs to Full Costs, and
- The *Adjusted EUL* (discussed below)

The Adjusted EUL is defined as that period of years over which the full savings would be claimed such that it matches the present value dollar benefits of the underlying dual baseline. That is, the EUL of the new equipment in Figure 6 below, represented by **Tx – T1**, is adjusted so that the present value of lifecycle benefits represented by area **X** in Figure 6 is equivalent to the present value of the lifecycle benefits represented by the sum of areas **X** and **Y** in Figure 1.

Figure 6. Lifecycle Savings: Approximation to Dual Baseline



The longer the RUL is, the larger the adjusted EUL. This follows the same logic as the case of the *inflated lifecycle benefit adjustment factors* except that the result is an adjusted EUL (that

[512] ER=Early Replacement; NR=Normal Replacement; SC=Special Circumstance; AO=Add On. Add on refers to adding something, which replaces nothing. Examples include adding controls to a boiler that had none, or adding insulation where there was none or some. Add-on measures are modeled at full costs and full savings for the length of their EULs. The full savings are reported toward first-year goals.

portion of the EUL for which the PV of using the full savings would equal the PV of the dual baseline savings).

PAs can obtain the adjusted EULs from the DEER-Based Tables based on typical ratios of incremental savings to full savings or from the PA-Based Tables if a PA can calculate its own savings ratios. The adjusted EUL is not used for TRC screening, but for the program's tracking database. The tables are organized in the same way as the earlier tables. The only difference is that the cells in the matrix contain adjusted EULs in years. Tables M-20 through M-28 contain DEER-Based adjusted EULs while Tables M-39 through M-47 contain PA-Based adjusted EULs.

APPENDIX N

SPECIAL CIRCUMSTANCE

Introduction

In its October 18, 2010 order[513], the Commission defined early replacement as replacement of equipment prior to the end of its prescribed effective-useful life and directed Staff to develop a dual baseline method for estimating the benefits and costs of early replacement that provides consistency between the treatment of savings and costs. The order also directed Staff to provide simplifying lookup tables for early replacement energy savings consistent with the dual baseline concept. The dual baseline methods and lookup tables have been developed and are provided in Appendix M of the Technical Manual.

The October 18, 2010 Order also introduced the concept of "special circumstance" replacements: the replacement of equipment operated by customers who are influenced by initial costs more than by life cycle economics. These customers include those with insufficient capital, a split incentive (such as a landlord incurring cost to provide a tenant benefit), short time horizons, and/or other factors which tend to prevent long range economic decision-making regarding the installation of high efficiency equipment. The Commission applied the concept of special circumstance replacements only to commercial and industrial machinery and multi-family central systems,[514] and only to equipment well past its prescribed effective useful life. The order specifically excluded lighting equipment from special circumstance replacement.

The Commission established a general outline for determining eligibility for special circumstance replacement treatment including:

Equipment age significantly exceeds its effective useful-life;
Energy consumption significantly exceeds that of current high efficiency models;
There is a history of significant repair or replacement with used equipment;
The prospective next repair or replacement is likely to be much less expensive than replacement with new higher efficiency machinery.

The order directed Staff to develop more detailed criteria and a method for adapting dual baseline screening for early replacement to special circumstance replacements, with consultation with the Evaluation Advisory Group (EAG) that includes the program administrators (PAs). In dual baseline analysis, the savings for the first baseline are calculated against the replaced equipment, while the savings for the second baseline are calculated against the current standards/codes minimums or, in the absence of such, common practice.

---

[513] Case 07-M-0548, Energy Efficiency Portfolio Standard (EEPS), Order Approving Consolidation and Revision of Technical Manuals (issued October 18, 2010).

[514] What "multi-family central systems" includes is clarified in detail in the Case 07-M-0548, Energy Efficiency Portfolio Standard (EEPS), Order Approving Modifications to the Technical Manual (issued July 18, 2011), pp 15 - 16.

In the July 18, 2011 order,[515] the Commission approved Staff's proposals regarding detailing the first two criteria for eligibility:[516]

> **Age Rule**: The equipment to be replaced must be aged at least 125% of it is prescribed effective-useful life in cases where the age of the equipment can be determined to this extent.[517] If the equipment is determined to be less than 125% of its EUL, it's not eligible for SC treatment regardless of consumption or any other factor
>
> **Energy Use Rule**: Applies **only** in cases in which the age of the existing equipment cannot be determined relative to 125%; existing equipment of most types must consume at least 20% more energy than the new high efficiency equipment to do the same amount of work, and at least 35% more for chillers.

In the July 18 Order, the Commission also approved Staff's proposal to define the first baseline, the hypothetical period for which the old equipment in place would have continued in use absent the program (the Default Functional Period or DFP) as 25% of the program efficient measure's EUL.[518]

The July 18, 2011 order also directed Staff to post directions and lookup tables for Special Circumstance replacement as a counterpart to those in Appendix M for early replacement. For the interim period, PAs were permitted to use the tables in Appendix M for Special Circumstances for costs. [519] However, Appendix N includes tables for special circumstance replacement that PAs must now use.

For equipment that qualifies as special circumstance, the dual baseline method described in Appendix M will be applied for special circumstance TRC screening. The dual baseline situation that characterizes the special circumstance situation, illustrated in Figure 1, involves a customer who replaces fully functioning equipment aged at least 25% beyond its official EUL. The equipment hypothetically would have continued to function for some period of time, the DFP. However, the customer is induced by the program to replace this existing equipment with more efficient equipment. It is assumed that at the end of the DFP, absent the program, the customer would have installed equipment that would meet the existing efficiency code or appliance standard, or common practice (referred to as the *code/standard equipment*).

Figure 2. The Special Circumstance Condition

---

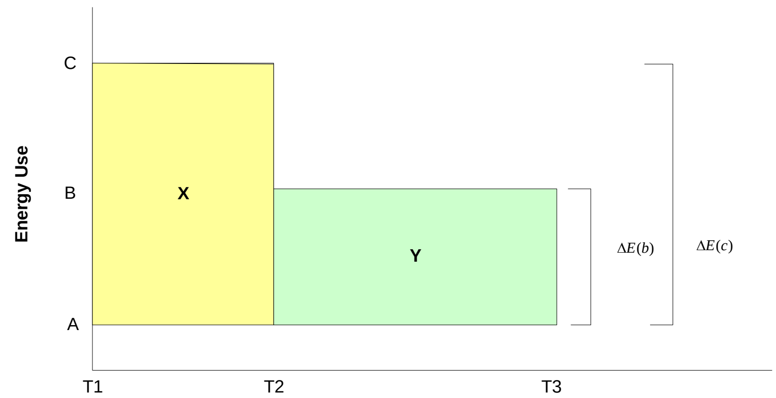
515 Ibid.

114 While the first two require definition of "significant," the third and fourth do not require or lend themselves to additional detail. The Commission also approved Staff's proposed relationship between the first two, i.e., energy consumption is considered only if age relative to 125% cannot be determined.

517 It is not necessary to determine the exact age of the equipment as long as it can be determined to be at least 125% of the effective-useful life.

518 The Order also included a comprehensive list of measures and associated EULs that should be used in cases where the special circumstance measure matches a measure in the Order. In cases where there is no match, PAs must propose and document the EUL.

519 Program administrators were required to research and calculate their own savings ratios and to use the second set of tables (not the DEER-based tables), as consumption of the old equipment in place may differ between early and special circumstance replacement -- the baseline existing equipment is pre EUL versus 125% past it, potentially with widely varying efficiency. For costs, the comparison is between current high efficiency versus standards/code or common practice in any case.



$\Delta E(c)$ = C - A
$\Delta E(b)$ = B - A
C = Energy use of pre-existing equipment
B = Energy use of equipment that meets code
A = Energy use of the efficient equipment rebated through program
T1 = Date on which new efficient equipment is installed
T2 = Date on which existing equipment was expected to have failed
T3= Date on which the new efficient equipment is expected to fail
T3 – T1 = Expected effective useful life (EUL) of the new efficient equipment
T2 – T1 = Expected period of time in which the pre-existing equipment would have continued to function, referred to as the default functional period (DFP)
T3 – T2 = Expected remaining EUL of the new efficient equipment

Energy savings in this example would consist of two portions. The customer would have experienced the ***full*** savings represented by the line segment C-A for the DFP period T2-T1, Area **X**. At the end of the DFP, the savings for the period T3-T2 would be reduced to ***incremental*** savings represented by the line segment B – A, area **Y**. To carry out these calculations, information on the energy use of code/standard equipment is required. Information on energy use of the existing equipment and the high efficiency equipment provided through the program is also required, but much more available and routinely needed.

The costs also have to be calculated in a manner consistent with the special circumstance case. In normal replacement situations, one would use the incremental cost that is defined as the cost of the new efficient equipment minus the cost of the code/standard equipment. In the special circumstance case, the incremental cost is calculated in a slightly different manner, which recognizes, in the absence of the program, the customer would not have purchased any equipment until the future end of the DFP.

Thus, one would first have to determine the full cost of the new efficient equipment at T1 *and* the full cost of the code/standard equipment (both including the installation labor) at T2 (assuming no change in real costs). The incremental costs would then be calculated as the cost of the new efficient equipment installed now (left column in Figure 2) minus the present value (PV) of the cost that is avoided in the future for the code/standard equipment (right column Figure 2). Figure 2 presents a case in which the DFP is 4 years and, absent the program, the code/standard equipment would have been installed in the fifth year. This calculation differs from the normal/end of life replacement incremental cost in adding the time value of money for spending the money earlier.

Figure 3. Incremental Cost Calculation for Special Circumstance Cases with a DFP of Four Years

Year	PV With Program	PV Without Program
1	Full Cost of High Efficient Equipment	0
2	0	0
3	0	0
4	0	0
5	0	Full Cost of Code/Standard Equipment

The Ratio Approach to the Dual Baseline with the Lookup Tables

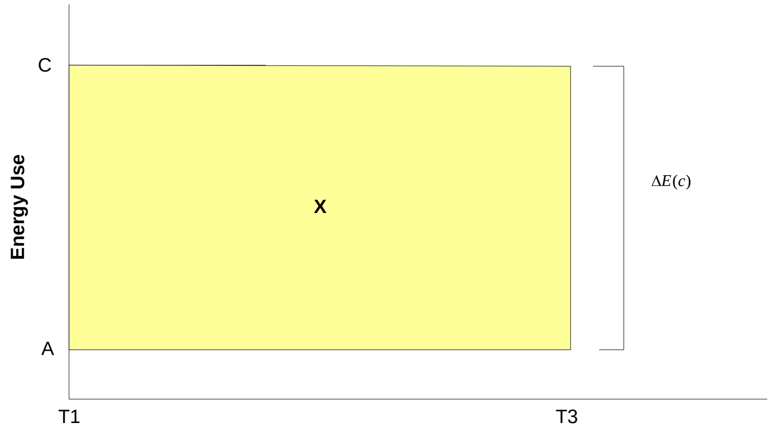
As in Appendix M, this approach focuses on the ratio of incremental energy savings to full energy savings[520] and the ratio of incremental costs to full costs. These ratios, shown at the top of the columns in Tables N-1 through N-2, determine the factors that PAs can use to adjust the savings and cost data. These first two tables require the program administrators to provide their own incremental costs and savings ratios (based on the code/standard equipment). To use these tables, PAs must match the ratios that they have calculated to the nearest corresponding ratios in these tables

To use Table N-1 for benefits, PAs will need to calculate the full annual savings as the annual energy use of the old equipment in place minus the annual energy use of the high efficiency equipment. These full savings are then counted for each year of the EUL as is represented as area *X* in Figure 3. For each year of the EUL (T3 – T1) of the new equipment, the full kWh or therm savings are converted to dollar benefits by multiplying them by the Commission's avoided costs estimates for that year[521].

Figure 5. Inflated Lifecycle Benefits

520 The savings values ratios are not area present values but are rather the line segments in Figure 1 on the vertical axis: (B – A) divided by (C – A).

521 The tables are not territory-specific, but statewide. This is because only the LRAC growth rates matter, not the absolute values, and the growth rates for the various zones are almost identical in the LRACs in use.



$\Delta E(c)$ = C - A
C = Energy use of pre-existing equipment
A = Energy use of the efficient equipment rebated through program
T1 = Date on which new efficient equipment is installed
T3 = Date on which the new efficient equipment is expected to fail
T3 – T1 = EUL of new efficient equipment

As a preliminary step in using Table N-1, and valid only for that purpose, the PAs will calculate this "inflated lifecycle benefits" for kWh, peak kW, and/or therms as the present value of the stream of full savings benefits for the EUL of the new equipment.[522]

In cases of special circumstance under the ratio approach, it is these inflated lifecycle benefits that must be adjusted using the appropriate *inflated lifecycle benefits adjustment factor*. For a given measure with a given EUL/DFP and ratio of incremental savings to full savings, the inflated lifecycle benefits adjustment factor is the ratio (presented as a percentage) of the present value of the dual baseline lifecycle benefits (X+Y) illustrated in Figure 1 to the present value of the inflated lifecycle benefits illustrated in Figure 3.

Under the Commission requirement of consistent treatment of savings and costs, the full costs[523] must also be adjusted downward. Using research on the costs of standard/code equipment, a PA can calculate the ratios of incremental costs to full costs and obtain the *full cost adjustment factors* from Table N-2. If a PA cannot obtain or chooses not to seek the data necessary to calculate the cost ratios, it can use the ratios and adjustment factors from Tables M-11 through M-19 in Appendix M in cases in which the measures match.

Note that all documentation for PA costs and savings estimates and ratios must be retained for possible Staff or ex post evaluator review.

Look-Up Tables

Tables N-1 and N-2 have been prepared so that PAs can obtain the Inflated Lifecycle Benefit and the Full Cost adjustment factors. For Inflated Lifecycle Benefits Adjustment Factors, PAs must calculate their own savings ratios. If PAs are able to calculate their own ratios of incremental

---

[522] Usually, the ratio of incremental kWh savings to full kWh saving would be the same as the ratio of incremental peak kW demand reduction to full peak kW demand reduction, which implies using the same ratio and adjustment factor for both. However, with some measure types, such as cooling, PAs may benefit from calculating different ratios of incremental to full for kWh and kW. A PA can choose to use higher 0.05 increment kW ratios if it can calculate and document them with retention.

[523] Full costs include the capital cost of the new efficient equipment plus installation cost.

costs to full costs, they may prefer to use Table N-2. However, as discussed above, in some cases PAs may use the tables in Appendix M to obtain cost ratios and adjustment factors.

For Tables N-1 and N-2, a PA should identify the 0.05 increment ratios that are closest to those it developed. The ratios range from 0.95 to .05 in increments of 0.05, and there are no measure designations.

Note that ratios of 1.0 and 0.0 are not included in the tables. For some measures, the efficiency of the old in place unit is still the common practice or no new standards have been adopted, i.e., the baseline for the full savings and the incremental savings are the same. As a result, the ratio of incremental to full savings is near 1.0, meaning that a PA can claim the full savings for the entire EUL of the new equipment (areas X and Y in Figure 4). Therefore, the lookup tables do not apply. For other measures, the high efficiency equipment subsidized by the program is consistent with current code or standards. For these measures, the incremental savings are zero and thus the ratio of incremental to full savings is 0.0.This means that a PA can claim full savings for only the RUL (area X in Figure 5), after which the high-efficiency replacement would have occurred anyway. Therefore, the lookup tables do not apply.

Figure 4. Efficiency of the Old In Place Unit Is Still the Common Practice Or No New Standards

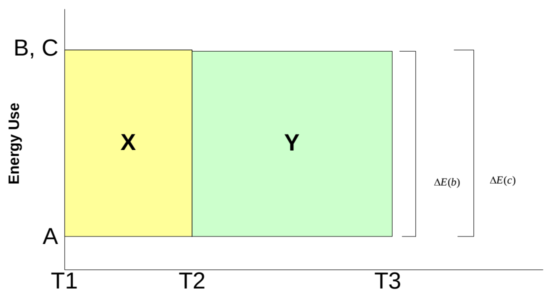


Figure 5. High Efficiency Equipment Subsidized by the Program Is Consistent with Current Code Or Standards

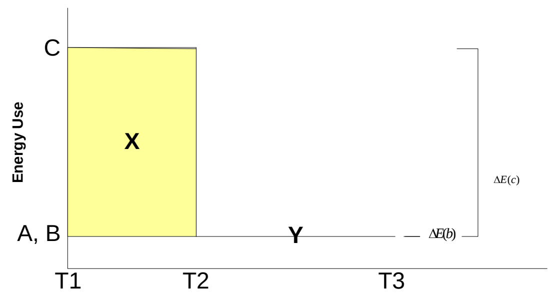


$\Delta E(c)$ = C - A
$\Delta E(b)$ = B - A
C = Energy use of pre-existing equipment
B = Energy use of equipment that meets code
A = Energy use of the efficient equipment rebated through program
T1 = Date on which new efficient equipment is installed
T2 = Date on which existing equipment was expected to have failed
T3= Date on which the new efficient equipment is expected to fail
T3 – T1 = Expected effective useful life (EUL) of the new efficient equipment
T2 – T1 = Expected remaining useful life (RUL) of the pre-existing equipment
T3 – T2 = Expected remaining EUL of the new efficient equipment

To use the tables, a PA must gather the following four pieces of information:

- the EUL of the type of equipment,
- the DFP of the old equipment in place (just 25% of the EUL),
- the full savings of the equipment (annual energy use of the old equipment in place minus the annual energy of the high efficiency equipment supported by the program), and
- the full costs (including installation)

Additionally, a PA will need documented estimates, based on equipment minimally compliant with standards/codes or common practice, of incremental savings and costs in order to calculate:

- The ratio of incremental savings to full savings, and
- The ratio of incremental costs to full cost

Again, note that for the costs, PAs can use the Tables in Appendix M where measures match.

Table Organization

Table N-1 contains the Inflated Lifecycle Benefit Adjustment Factors while Table N-2 contains the Full-Cost Adjustment Factors.

In Table N-1, the first row is the ratio of incremental savings to full savings while in Table N-2 the first row is the ratio of incremental to full cost. In both tables, the first two columns identify the EULs and corresponding DFPs:

- 25 Years/6
- 20 Years/5
- 14 to 17 Years/4
- 10 to 13 Years/3

The remaining columns present the respective adjustment factors by ratio of

- Table 1: Incremental savings to full savings
- Table 2: Incremental costs to full costs

Program-Tracking Database Requirements

The program tracking databases contain information for each measure installation which the PAs are required to maintain for the purposes of current reporting and future impact evaluation, the latter requiring many fields not used for current reporting. The following seven additional required variables, as were first required in Appendix M,[524] are being added by Staff through the Evaluation Advisory Group process[525]:

- Type of Installation (TRC Approach)[526] ,
- The Full Savings (kWh or therms),
- If electric, the on-peak demand reductions associated with the Full Savings,
- The *Adjusted Full Cost* (full cost multiplied by the full-cost adjustment factor),
- The Ratio of Incremental Savings to Full Savings,
- The Ratio of Incremental Costs to Full Costs, and

524 Note that item #2 above is a correction of item #2 in Section 5 of Appendix M. Furthermore, item #3 is now required in addition to those variables listed in Section 5 of Appendix M. Those using Appendix M should take note of these changes.

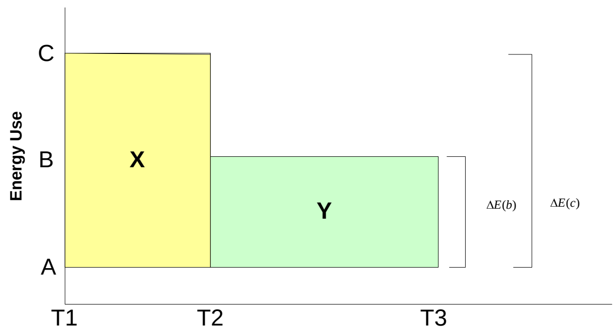
525 Note that for cases of normal replacement and add-on, the variables 2 through 7 should be coded as "n/a" (not applicable).

526 ER=Early Replacement; NR=Normal Replacement; SC=Special Circumstance; AO=Add On. Add on refers to adding something that replaces nothing. Examples include adding controls to a boiler that had none, or adding insulation where there was none or some. Add-on measures are modeled at full costs and full savings for the length of their EULs. The full savings are reported toward first-year goals.

- The *Adjusted EUL* (discussed below).

The Adjusted EUL is defined as that period of years over which the present value benefits of the full savings would approximate the present value dollar benefits of the underlying dual baseline. Figure 6 shows the Adjusted EUL Tx, reduced from the actual EUL T3 such that the lifecycle savings over the period Tx – T1 approximates the lifecycle savings over the period T3 – T1 in Figure 1 (repeated from above). The longer the DFP is, the longer the adjusted EUL, owing to more years at full savings.

Figure 1. Lifecycle Savings: Dual Baseline



=

Figure 6: Lifecycle Savings: Approximation to Dual Baseline

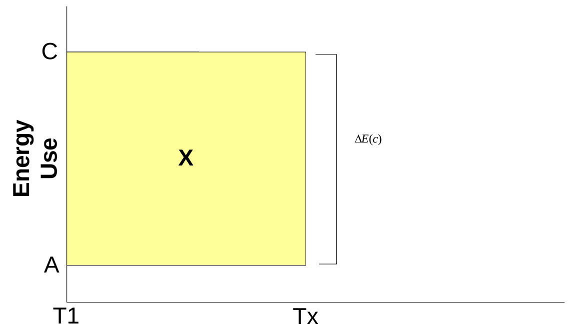


Table N-3 presents the adjusted EULs in years for each possible ratio (in 0.05 increments). In Table N-3, the first row is the incremental to full savings ratio and the first two columns identify the EULs and corresponding DFPs. The adjusted EUL is not used for TRC screening, but only for the program's tracking database. Table N-3 is organized in the same way as the Table N-1. Note that Tables N-1 through N-3 are also available in Excel.

Example

Consider the following example. Suppose a PA finds in place equipment with an EUL of 17 years whose age is determined to be 22 years. The five years over the EUL is greater than 25% of the EUL (17/4 = 4.25 which rounds to 4, which is also the DFP). The equipment is eligible for special circumstance treatment if it also meets criteria #3 and #4. The PA has determined that the ratio of incremental savings to full savings is 0.65 and the ratio of incremental costs to full costs is 0.40. To find the Inflated Lifecycle Benefits Adjustment Factors, the Full Cost Adjustment Factors, and the Adjusted EUL for this measure, the PA must go to Table N-1 and identify the row for measures with an EUL of 17 years and a DFP of 4 years. Next, they must identify the column with an incremental savings to full savings ratio of 0.65. The value in the intersection of this row and this column is 0.75, which is the Inflated Lifecycle Benefits Adjustment Factor. Using Table N-3, the same procedure would be followed to obtain the Adjusted EUL of 10 years.

To find the Full Cost Adjustment Factor, the PA would go to Table N-2, find the row with a 4-year DFP and the column with a ratio of 0.40. The value in the cell is 0.52, which is the Full Cost Adjustment Factor. As discussed above, in some cases PAs may use the tables in Appendix M to obtain cost ratios and adjustment factors.

The next step is to multiply the inflated benefits by the benefits factor and the full costs by the costs factor. For Total Resources Cost (TRC) analysis, ratio the two products, benefits/costs. For first year savings to report against approved program goals, for special circumstances replacements PAs would use the full savings, the first baseline of the existing equipment versus the high efficiency program measure.

APPENDIX O

COMMERCIAL AND INDUSTRIAL LIGHTING POLICY

INTRODUCTION

On January 12, 2011 Staff issued a SAPA Notice, in part on proposals to implement directives in the Commission's October 18, 2010 order in Case 07-M-0548 regarding benefit/cost analysis for Special Circumstance customers in Energy Efficiency Portfolio Standard (EEPS) programs.[527] In its 2/28/11 comments, National Grid sought clarification regarding: whether field staff must determine the age of lighting fixtures in place and how to treat lighting replacement where the age of the fixture in place is past its prescribed effective useful life (EUL). With regard to these lighting issues, the Commission in its July 18, 2011 order in the EEPS proceeding directed[528] "the Implementation Advisory Group to attempt to resolve the issues of determining the age of lighting equipment and the correct approach for valuing savings from lighting replacements[529] under the mechanism we provided for modifying the Consolidated Technical Manual [CTM] in our June 20, 2011 Order in this proceeding."[530]

Regarding commercial and industrial lighting issues,[531] the technical manual, effective 1/1/11 [*as modified September 2012]*, states: "The baseline condition is assumed to be the existing *[and operational]* lighting fixture in *[all applications other than new construction or extensive renovations which trigger the building code*]." This makes the savings baseline and costs for TRC analysis independent of the age of the operational fixture. This approach reflects the frequent impracticality of determining the age of lighting fixtures

Absent this provision, replacement of fixtures in place which are either (1) irreparable (unusable and not economic to repair) or, (2) operating and not demonstrably younger than their EUL (in short, broken or past EUL) would be treated as normal/end of life replacement: modeled with incremental costs and with incremental savings for the full EUL of the new measure, including for first year scorecard reporting.[532] Fixtures in place in working order and demonstrably aged below their EUL would get early replacement treatment which, for most non-lighting measures, would mean dual baseline treatment per Appendix M. Appendix M, however, excludes lighting from such treatment.[533] Therefore, the conventional early replacement modeling of full costs and full savings would still apply, with the full savings against the old fixture in place modeled for the full EUL of the new equipment and reported as first year scorecard savings.

---

[527] SAPA 07-M-0548SP30 - Proceeding on Motion of the Commission Regarding an Energy Efficiency Portfolio Standard.

[528] Case 07-M-0548, Order Approving Modifications to the Technical Manual, pp. 16-17.

[529] Savings are related to the type of lamp used in the fixture.

[530] New York Standard Approach for Estimating Energy Savings from Energy Efficiency Programs, October 15, 2010, p. 109, www.dps.ny.gov/Tech ManualNYRevised10-15-10.pdf

[531] C&I lighting includes multi-family building common areas for the purposes of this paper.

[532] Incremental means the costs and consumption of the high efficiency model promoted by the program minus the costs and consumption of the standard efficiency level alternative – Federal minimum appliance standards, State building codes or, in the absence of codes and standards, the common practice.

[533] Appendix M, posted with Technical Manual, see footnote #5, p. 10.

In compliance with instructions stated in the July 18, 2011 Order, this appendix prescribes principles for C&I lighting replacements, both replacements of operational fixtures and irreparable fixtures, addressing:

- Replacements for which incentive funding is precluded, as a practical matter of presumptive TRC failure by definition,
- Inputs for TRC ratio calculations,
- Age determination requirements (none), and
- Values for reporting as first year annualized savings against targets approved in orders (the same as the first year savings modeled in the TRC analysis).

The Overall Principles

If a lighting fixture of any age is operational, replacement is early replacement. The full savings against the fixture in place[534], will be reported as first year savings and modeled for the full EUL of the replacement measure in TRC screening. Costs will be full costs, the total costs of the replacement, as is usual for early replacement analysis outside Appendix M.[535]

For irreparable lighting fixtures, normal/end of life rules apply: incremental savings and costs between the common practice and the high efficiency measures promoted by EEPS are used for TRC analysis; incremental savings are used for first year scorecard savings; and no age determination is required.

Discussion by Type of Equipment Replaced

The lighting upgrades considered here are; screw-in incandescent fixtures (which will evolve toward use of halogen lamps)[536] replaced with CFL or LED fixtures. Linear fluorescent T12 or standard T8 replaced with Super T8s, T5s or LEDs.[537] The fixtures in place may be either in good working order (early replacement) or irreparable (normal replacement).

Baselines: Screw-In Fixtures

Screw-in fixtures are expected to continue to accommodate the least efficient lamp types which still meet the national lighting standards established under the Energy Independence and Security Act of 2007 (EISA).Therefore, the baseline choice for early or normal replacement with any pin-based fixtures remains screw-in fixtures: either to keep a working fixture in place or to replace an irreparable one with a new screw-in fixture. Once the EISA standard is phased-in for a particular lamp size the least efficient lamp technology meeting the standard would normally be considered the baseline. Incandescent lamps, however, are expected to remain in inventories for sale and are reportedly being stockpiled. A screw-in fixture can house, for baseline consumption relative to CFLs, either incandescent or halogen

---

534 The full savings differs from incremental savings in subtracting the consumption of the fixture supported by the program from the consumption of the fixture in place, not from the consumption of the current common alternative.

535 If passing the TRC, however, is a concern, PAs may choose to document an age past the EUL to be able to model the incremental costs used re: normal replacement as opposed to the full costs usual for early replacement.

536 Halogen lamps consume approximately 72% as much as incandescent lamps. Whereas the TRM reports a delta of watts consumption of 2.53 between CFLs and incandescent lamps, the delta would be approximately 1.55 for CFLs against halogen lamps. This means that 1.55 times the CFL wattage is the savings delta against a halogen lamp.

537 Speaking only of the types whose replacement are usual subjects of EEPS programs, thus not including high intensity discharge (HID) fixtures, metal halide, high pressure sodium, mercury vapor, *or CFLs or LEDs yet*. Perhaps at some point it will be cost effective to replace CFLs with LED lamps.

lamps. Therefore, baselines will be based upon deemed years, for each wattage range, in which installation of the new common practice technology, halogen lamps, is more likely than installation of stockpiled incandescent lamps.[538] Until reconsideration (based on studies in progress and program experience) in March 2015, incandescent lamps will remain the baseline.

For fixtures compatible with incandescent and halogen lamps, TRC analysis of a measure or project may be occurring before the deemed switch year or after it. Analysis done before the estimated switch year will entail two baselines of consumption during the EUL of the screw-in alternative to CFL.[539] The first baseline will be incandescent lamp consumption until the beginning of the deemed switch year,[540] the second baseline being halogen lamp consumption. In future TRC analysis after the deemed switch dates, the baseline for incremental savings will be halogen lamps against CFLs throughout.

Baselines: Linear Fluorescent Fixtures

For early replacement of an operational T12 fixture, the baseline relative to super T8s is simply the consumption of the T12 lamp. For normal replacement of an irreparable T12 fixture, the baseline, until reconsideration (based on studies in progress and program experience) in March 2015, is the consumption of a T12. At some point, customers will no longer be installing relatively inefficient T12 fixtures in significant numbers as lamp availability decreases[541] and therefore standard T8s will be the common practice and thus the suitable linear fluorescent baseline for consideration of appropriate super T8s and T5s.

ELIGIBILITY FOR REBATES

The next issue is potential cost-effectiveness and thus measures' eligibility for rebates. Incentives for CFL (and potentially for LED lamp) pin fixtures, as needed and if cost- effective, may continue to be appropriate for some years to come.[542] Incandescent/halogen fixtures may remain in use indefinitely, with halogens being less expensive upfront as well as more familiar looking than CFLs or LED lamps. Replacement of screw-in fixtures with new screw-in fixtures may continue, and thus incentives for replacement with higher efficiency technologies make sense.

Turning to rebate-eligibility of linear fluorescent fixtures, since installation of T12 fixtures will be unlikely at some point and replacement of a standard T8 fixture with a standard T8 fixture would yield no savings. At that point, savings will exist and cost-effective incentives will be payable only for installation of super T8s (or T5s) in watts-saving configurations. Super T8s produce more lumens per watt and have improved color rendering and a longer rated life, but since ratepayers should not pay for extra lumens, incentives should be paid only for projects which reduce the overall wattage of fixtures relative to standard T8s.

COSTS TO BE MODELED

[538] While in reality the technology mixes will shift gradually, the baselines as executed here will require selection of the year in which the probable majority choice will switch.
[539] Screw-in LEDs are unlikely in the C&I context in which quality concerns require LED fixtures.
[540] While incandescent lamps installed before the switch year may remain in use during it, this would probably be for a short time given the usual heavy C&I usage. Additionally, fractional year modeling is not practical.
[541] This will not happen often enough to justify ratepayer subsidy of all replacements to avoid the occasional instance. Retrogression from T8 to T12 is particularly unlikely.
[542] This is also applicable for screw-in CFLs for incandescent/halogen fixtures.

The last issue is costs to be modeled in TRC screening. For early replacement of operational, screw-in incandescent/halogen fixtures, the TRC screening would as usual include the full *costs* of the replacement, additionally owing to the indefinite remaining life of the fixture in place, and to the continued availability of inexpensive screw-in fixtures usable for halogen. Since most equipment replaced will be in working order, the full-costs case will be the most common, but with incremental costs for normal replacement of irreparable fixtures.

Turning to costs to be modeled for linear fluorescent fixtures, operational standard T8s can remain in place for some years, and therefore full costs for early replacement are fully appropriate. If age past the EUL is documented, however, PAs may model incremental costs for normal replacement. Also as a case of normal replacement, since irreparable standard T8 fixtures can be replaced with like, the modeling of incremental costs for super T8 fixtures is justified.

FORMS

TYPICAL MEASURE HEADINGS

Measure Name ____

Measure Description ____

Method for Calculating Annual Energy and Peak Coincident Demand Savings

Annual Electric Energy Savings

$$\Delta kWh = units \times (savings\ equation)$$

Peak Coincident Demand Savings

$$\Delta kW = units \times (savings\ equation) \times CF$$

Annual Gas Energy Savings

$$\Delta therms = units \times (savings\ equation)$$

WHERE:

ΔkWh	= Annual electric energy savings
ΔkW	= Peak coincident demand electric savings
Δtherms	= Annual gas energy savings
units	= Number of measures installed under the program
CF	= Coincidence factor

Summary of Variables and Data Sources

Variable	Value	Notes

Coincidence Factor (CF)

The recommended value for the coincidence factor is ________

Baseline Efficiencies from which Savings are Calculated

____

Compliance Efficiency from which Incentives are Calculated

____

Operating Hours

____

Effective Useful Life (EUL)

Years: __________________

GLOSSARY

ABBREVIATIONS, ACRONYMS, AND EQUATION VARIABLES	
$\overline{COP}$	Average coefficient of performance
η	Energy efficiency (0 -100%)
$\bar{\eta}$	Average energy efficiency (0 -100%)
$\overline{\Delta T}$	Average temperature difference
$\overline{EER}$	Seasonal average energy efficiency ratio over the cooling season BTU/watt-hour, (used for a particular climate/building)
ΔkW	Peak coincident demand electric savings
ΔkWh	Annual electric energy savings
ΔQ	Heat difference/loss
ΔT	Temperature difference
Δtherms	Annual gas energy savings
Δ	Change, difference, or savings
A	Amperage
AC	Air conditioning
ACCA	Air Conditioning Contractors of America
ACEEE	American Council for an Energy-Efficient Economy
ACL	Actual cooling load (Btu/hr) based on Manual J calculation
ACH	Air change per hour
AFUE	Annual fuel utilization efficiency, seasonal energy efficiency for fuel heating equipment
AHAM	Association of Home Appliance Manufacturers
AHL	Actual heating load (Btu/hr) based on Manual J calculation
AHRI	Air Conditioning Heating and Refrigeration Institute
AHU	Air handling unit
AIA	American Institute of Architects
ANSI	American National Standards Institute
APU	Auxiliary power unit
area	Extent of space or surface
ARI	Air-Conditioning & Refrigeration Institute
ARRA	American Recovery and Reinvestment Act of 2009
ASHP	Air source heat pump
ASHRAE	American Society of Heating, Refrigeration, and Air Conditioning Engineers
baseline	Baseline condition or measure
BLDC	Brushless DC electric motor
BTU	British Thermal Unit
BTUh	British Thermal Units per hour
CAC	Central air conditioner
CADR	Clean Air Delivery Rate (CFM)
Capacity	Cooling output rating, in Btu/hr
CAV	Constant air volume

CBECS	Commercial Buildings Energy Consumption Survey
CDD	Cooling degree days - The number of degrees that a day's average temperature is above some baseline temperature, which represents the temperature above which buildings need to be cooled. The baseline temperature is typically 65°F, but may vary based on application.
CEC	State of California Energy Commission
CEE	Consortium for Energy Efficiency
CEF	Combined energy factor (lb/kWh)
CEER	Combined Energy Efficiency Ratio
CF	Coincidence factor
CFL	Compact fluorescent lamp
CFM	Cubic foot per minute
CHW	Chilled water
CHWP	Chilled water pump
CLH	Cooling load hours
CM	Case motor
CMU	Concrete masonry
$Comp_{eff}$	Efficiency of the cooler/freezer compressor (kW/Ton)
COP	Coefficient of performance, ratio of output energy/input energy
CV	Constant volume
CW	Condenser water
CWP	Condenser water pump
$Cycles_{annual}$	Number of dryer cycles per year
D	Demand
DC	Direct current
DCV	Demand controlled ventilation
DEER	Database for Energy Efficiency Resources, California
DF	Demand diversity factor
DFP	Default functional period
DHW	Domestic hot water
Dia	Diameter
DLC	DesignLights Consortium®
DOAS	Dedicated outdoor air system
DOE 2.2	US DOE building energy simulation, and cost calculation tool
DPS	Department of Public Service, New York State
DSF	Demand savings factor
DX	Direct expansion
ECCC NYC	Energy Conservation Construction Code of New York City
ECCC NYS	Energy Conservation Construction Code of New York State
EC	Electronically commutated
Econ	Economizer
Ecotope	Ecotope Consulting, Redlands, CA
ee	Energy efficient condition or measure
EEPS	Energy Efficiency Portfolio Standard

EER	Energy efficiency ratio under peak conditions
EF	Energy factor
Eff	Efficiency
E_c	Combustion efficiency
Efficiency Vermont	State of Vermont Energy and Efficiency Initiatives
E_t	Thermal efficiency
EFLH	Equivalent full-load hours
EIA	Energy Information Administration, US
EISA	Energy Independence and Security Act (EISA) of 2007
ElecSF	Electric Savings Factor
ENERGY STAR®	U.S. Environmental Protection Agency voluntary program
Energy Trust	Energy Trust of Oregon, Inc.
EPA	Environmental Protection Agency (EPA), US
EPACT	Energy Policy and Conservation Act of 2005
EPDM	Ethylene propylene diene monomer roofing membrane
ERV	Energy recovery ventilation
ESF	Energy savings factor
EUL	Effective useful life
EFan	Evaporator fan
Exh	Exhaust
F	Factor
F_{elec}	Percentage of energy consumed that is derived from electricity
F_{gas}	Percentage of energy consumed that is derived from gas
FEMP	Federal Energy Management Program
FL	Full-load chiller efficiency under peak conditions
FLH	Full-load hours
Flow	Nozzle flow
FPFC	Four pipe fan coil
ft^2	Square foot
GasSF	Gas Savings Factor
GDS	GDS Associates, Marietta, GA
Glazing area	Aperture area of glazing
GPD	Gallons Per Day
GPM	Gallons Per Minute
GSHP	Ground source heat pump
H_v	Heat of vaporization (latent heat), in Btu/lb
$H_2O_{savings}$	Water savings
HDD	Heating degree days - The number of degrees that a day's average temperature is below some baseline temperature, which represents the temperature below which buildings need to be heated. The baseline temperature is typically 65°F, but may vary based on application.
HID	High intensity discharge lamp

hp	Horsepower
HP	High performance
hrs	Hours
$hrs_{operating}$	Operating hours
HSPF	Heating seasonal performance factor, BTU/watt-hour, total heating output (supply heat) in BTU (including electric heat) during the heating season / total electric energy heat pump consumed (in watt-hour)
ht	Height
HVAC	Heating, ventilation, and air conditioning
$HVAC_c$	HVAC interaction factor for annual electric energy consumption
$HVAC_d$	HVAC interaction factor at utility summer peak hour
$HVAC_g$	HVAC interaction factor for annual natural gas consumption
HW	Hot water
IECC	International Energy Conservation Code
IEER	Integrated energy efficiency ratio
IESNA	Illuminating engineering Society of North America
IPLV	Integrated Part-Load Value, a performance characteristic, typically of a chiller capable of capacity modulation.
k	Thermal conductivity
$KBTUh_{in}$	Gas input rating (kBTU/h)
$kBTUh_{out}$	Heating output rating (kBTU/h)
kW	kilowatts
L	Length
LBNL	Lawrence Berkeley National Laboratory
leakage	Estimate of percent of units not installed in service territory
LED	Light emitting diode
LEED	Leadership in Energy and Environmental Design
LF	Load Factor
Load	Average total weight (lbs) of clothes per drying cycle
LPD	Lighting power density
LRAC	Long-run avoided cost
LSAF	Load shape adjustment factor
MEC	Metropolitan Energy Center
NAECA	National Appliance Energy Conservation Act of 1987
NBI	New Buildings Institute
NEA	National Energy Alliances
NEAT	National Energy Audit Tool
NEMA	National Electrical Manufacturers Association
NREL	National Renewable Energy Laboratory
NRM	National Resource Management
NSTAR	Operating company of Northeast utilities
NWPPC	Northwest Power Planning Council
NWRTF	Northwest Regional Technical Forum
NY DPS	New York State Department of Public Service

NYISO	New York Independent System Operator
NYSERDA	New York State Energy Research and Development Authority
^{o}F	Degrees Fahrenheit
OSA	Outdoor supply air
PA Consulting	PA Consulting Group
PF	Power factor
Phase	Number of phases in a motor (1 or 3) Single Phase is a type of motor with low horsepower that operates on 120 or 240 volts, often used in residential appliances. Three phase is a motor with a continuous series of three overlapping AC cycles offset by 120 degrees. Three-phase is typically used in commercial applications.
PLR	Power loss reduction
PNNL	Pacific Northwest National Laboratory
PSC	Public Service Commission, New York State
PSF	Proper sizing factor
psia	Atmospheric pressure (lbs per square inch)
psig	Gauge pressure (lbs per square inch)
PSZ	Packaged single zone
PTAC	Package terminal air conditioner
PTHP	Packaged terminal heat pump
Q	Heat
$Q_{reduced}$	Reduced heat
Q_{reject}	Total heat rejection
r	Radius
RA	Return air
RAC	Room air conditioner
RE	Recovery efficiency
RECS	Residential Energy Consumption Survey
RESNET	Residential Energy Services Network
RH	Reduced heat
RLF	Rated load factor
RPM	Revolutions per minute
R-value	A measure of thermal resistance particular to each material
S	Savings
SAPA	State Administrative Procedure Act
SBC	System Benefit Charge
SCFM	Standard cubic feet per minute @ 68 ^{o}F and 14.7 psi standard condition
SEER	Seasonal average energy efficiency ratio over the cooling season, BTU/watt-hour, (used for average U.S. location/region)
SF	Square foot
SHGC	Solar heat gain coefficient
SL	Standby heat loss
Staff	NYS Department of Public Service Staff
standby	Standby Power (watts)

T	Temperature
TAF	Temperature adjustment factor
TDA	Total Display Area (ft^2)
TDEC	Total Daily Energy Consumption
TEFC	Totally enclosed fan cooled
th	Thickness
therm	Unit of heat
THR	Total heat rejection
$Throttle_{fac}$	Throttle factor
TMY	Typical meteorological year
tons	Tons of air conditioning
tons/unit	Tons of air conditioning per unit, based on nameplate data
TRC	Total Resources Cost
TRM	Technical Resource Manual
UA	Overall heat loss coefficient (BTU/hr-°F)
UEF	Uniform Energy Factor
unit	Measure
units	Number of measures installed under the program
UPC	Uniform Plumbing Code under the International Association of Plumbing and Mechanical Officials
US DOE	United States Department of Energy
US EPA	United States Environmental Protection Agency
U-value	Measure of heat loss in a building element/overall heat transfer co-efficient
V	Volt
v	Volume
VAV	Variable air volume
VSD	Variable speed drive
W	watts
W_{ctrl}	Total wattage of controlled lighting (watts)
Wisconsin PSC	State of Wisconsin Public Service Commission

Equation Conversion Factors	
0.000584	Conversion factor used in DOE test procedure
0.00132	Electric efficient storage type water heater replacing standard storage tank water heater. NAECA referenced as function of storage volume.
0.0019	Natural gas efficient storage type water heater replacing standard storage tank water heater. NAECA referenced as function of storage volume.
0.284	Conversion factor, one kW equals 0.284 ton
0.293	Conversion factor, one BTU/h equals 0.293071 watt
0.473	Conversion factor (liters/pint)
0.67	Natural gas water heater Energy Factor
0.746	Conversion factor (kW/hp), 746 watts equals one electric horsepower
0.97	Electric resistance water heater Energy Factor
1.08	Specific heat of air × density of inlet air @ 70°F × 60 min/hr
1.6	Typical refrigeration system kW/ton
3.412	Conversion factor, one watt-hour equals 3.412142 BTU
3.517	Conversion factor, one ton equals 3.517 kilowatts
8.33	Energy required (BTU's), to heat one gallon of water by one degree Fahrenheit
12	kBTUh/ton of air conditioning capacity
24	Hours in one day
67.5	Ambient air temperature °F
91	Days in winter months
100	Conversion factor, one therm equals 100 kBTU
274	Days in non-winter months.
365	Days in one year
3,412	Conversion factor, one kWh equals 3,412 BTU
8,760	Hours in one year
12,000	Conversion factor, one ton equals 12,000 BTU/h
1,000	conversion factor, one kW equals 1,000 watts
100,000	conversion factor, (BTU/therm), one therm equals 100,000 BTU's

Record of Revision

Record of Revision Number	Issue Date
0	12/10/2014
6-15-4	6/1/2014
1-17-9	12/31/2016
6-17-17	6/30/2017
9-17-12	9/30/2017
12-17-Y	12/31/2017
