Re: Case 04-M-0159, Proceeding on the Motion of the Commission to Examine the Safety of Electric Transmission and Distribution Systems

Consolidated Edison Company of New York, Inc.'s 2018 Contact Voltage Test and Facility Inspection Annual Report

Dear Secretary Burgess:

Consolidated Edison Company of New York, Inc. submits for filing its 2018 Contact Voltage Test and Facility Inspection Annual Report ("Report"). The Report is submitted pursuant to the requirements of the Public Service Commission's Electric Safety Standards issued in the referenced proceeding.

Thank you for your assistance.

Sincerely,

Att:

2018

CONTACT VOLTAGE TEST & FACILITY INSPECTION ANNUAL REPORT

CONSOLIDATED EDISON COMPANY OF NEW YORK, INC.

Report on the results of contact voltage tests & facility inspections for the period beginning

January 1, 2018 and ending on December 31, 2018.

February 15, 2019

I. Background

The New York State Public Service Commission's ("PSC" or "Commission") Electric Safety Standards ("Safety Standards")¹ in Case 04-M-0159 require utilities to conduct an annual system-wide contact (stray) voltage detection program for underground assets and municipally owned streetlights and a five-year equipment inspection program to mitigate contact (stray) voltage risks to the public and promote reliability.

The term "stray voltage" is historically associated with neutral-to-earth voltage (NEV) encountered by farm livestock at contact points. Stray voltage is a normally occurring phenomenon that can be found at low levels between two contact points any location where electricity is grounded.² In recent years, the term "contact voltage" has been used to describe voltage resulting from abnormal power system conditions associated with low voltage secondary system faults.

This report describes Consolidated Edison Company of New York, Inc.'s ("Con Edison" or "Company") contact voltage detection program and equipment inspection program conducted in 2018.

II. Company Overview

Con Edison is an investor-owned utility that provides electric service to approximately 3.4 million customers in a service area of approximately 604 square miles within New York State encompassing New York City, except the Rockaway Peninsula, and most of Westchester County. The Company operates an electric transmission and distribution ("T&D") system that provides a high level of reliability in a very dense urban environment.

¹ The Commission's *Order Granting in Part Petition to Modify Electric Safety Standards*, Appendix A, issued January 13, 2015 in Case 04-M-0159, provides the current version of the Safety Standards. The Safety Standards were originally issued on January 5, 2005, with subsequent revisions issued on July 21, 2005, December 15, 2008, March 22, 2013 and January 13, 2015.

² Electrical systems — both farm systems and utility distribution systems — are grounded to the earth to ensure safety and reliability. Inevitably, some current flows through the earth at each point where the electrical system is grounded and a small voltage develops. This voltage is called neutral-to-earth voltage (NEV). When NEV is found at animal contact points, it is frequently called stray voltage. Stray voltage is this small voltage that is measured between two points that livestock can simultaneously touch. If these points are simultaneously contacted by an animal, a current will flow through the animal. See http://psc.wi.gov/SiteAssets/svUpdate2006.pdf

• Distribution

- a. Underground Con Edison's underground system has approximately 283,000 manholes, service boxes, transformer vaults, and above ground pad mounted structures; approximately 25,400 miles of underground duct; and approximately 96,200 miles of underground cable including primary, secondary and service cables. Underground network cables operating at primary voltages of 33kV, 27 kV and 13.8 kV supply underground transformers that step the primary voltages down to 120/208 distribution voltages that are used by customers.
- b. Overhead Con Edison's overhead system includes: 192 auto loops, 13 4 kV multibank substations, 219 – 4 kV unit substations, approximately 270,000 Con Edison and joint owned poles, and approximately 34,300 miles of overhead wires including primary, secondary, and services. Cables operating at primary voltages of 33 kV, 27 kV, 13.8 kV, and 4 kV supply approximately 51,800 overhead transformers that step the primary voltages down to 120/208/240 distribution voltages that are used by customers.
- c. Streetlights Con Edison does not own, install, or maintain streetlights and traffic signals within its service territory. The New York City Department of Transportation (NYCDOT) and the local Westchester municipalities primarily own the streetlights and traffic signals in New York City and Westchester County. There are approximately 185,000 metal pole street lights and metal pole traffic signals within Con Edison's service territory.
- Transmission
 - underground Con Edison's underground transmission system delivers power at 69 kV, 138 kV, and 345 kV to various switching substations and area substations. The underground system has approximately 2,200 underground transmission facilities and approximately 810 circuit miles of cable. Of the 810 circuit miles, Con Edison owns approximately 727 miles.
 - b. *Overhead* Con Edison's overhead transmission system consists of 138 kV and 345 kV high voltage cable supported on approximately 1,220 towers and poles on rights-of-way located, for the most part, north of New York City and terminating in Westchester County where the underground transmission system begins.
- Substations and Unit Substations

There are 71 properties that contain 41 transmission and 62 area substations. In addition, there are 232 unit substations and multi-banks which include six customer-owned NYC airport multibanks.

III. Inspection and Contact Voltage Testing Frequency for Company and Municipally Owned Facilities

On January 5, 2005, the Commission established the Electric Safety Standards that require all utility-owned electric facilities to be inspected and contact (stray) voltage testing be performed on a specific shedule. Overhead Distribution facilities, Underground Residential Distribution System facilities, Underground and Overhead Transmission facilities and Substations must be inspected and contact (stray) voltage tested once every five years. Underground Distribution Facilities must be inspected once every eight years as part of the pilot program adopted in Case 16-E-0060³ and contact (stray) voltage tested once per year. The Safety Standards also require annual contact voltage testing for all city and municipally owned streetlights.

The following eight categories of facilities in Con Edison's service area must be inspected and tested for the presence of contact voltage:

- Underground Distribution There are approximately 266,000 underground facilities in Con Edison's Distribution systems. A subsurface structure is defined as any manhole (MH), service box (SB), transformer vault (V,VS), or transformer manhole (TM) associated with the underground distribution system. All Underground Distribution facilities are inspected every eight years and are tested for contact voltage annually in either the manual or mobile contact voltage testing programs.
- Underground Residential Distribution (URD) System There are approximately 17,000
 URD facilities in Con Edison's Distribution systems. A subsurface structure is defined as
 any manhole (MH), service box (SB), transformer vault (V,VS), transformer manhole
 (TM), injunction box (IJ), P-Box (PB), and T-Tap box and switchgear associated with the
 URD system. All URD facilities are inspected and contact voltage tested every five years.
- *Overhead Distribution* There are approximately 270,000 distribution pole structures that support electric facilities in Con Edison's overhead distribution system. Distribution overhead facilities are inspected and tested for contact voltage every five years. The contact voltage testing criteria include all utility-owned or joint use wooden poles with utility electrical facilities located on public thoroughfares or customer property, including

³ The Commission's *Order Approving Electric and Gas Rate Plans* issued January 25, 2017 in Case 16-E-0060, et al, authorized Con Edison's pilot program to increase the inspection cycle for underground distribution equipment from five to eight years. This pilot will allocate efforts and funds towards decreasing the repair backlog while incorporating a more robust inspection effort which includes infrared scanning and ampere testing in the underground structures and additional targeted mobile contact voltage scans in areas with a history of repeat contact voltage detection.

backyards or alleys. Contact voltage tests are performed on all wooden poles with metallic attachments such as ground wires, ground rods, anchor guy wires, riser pipes, or any electrical equipment within reach of the general public.

- *Street Lights and Traffic Signals* There are approximately 185,000 metal pole street lights and/or traffic signals within Con Edison's service territory. Streetlights and traffic signals are included in the annual contact voltage testing program. Con Edison does not own any metal pole streetlights, and therefore, these structures are not included in the facility inspection program. Area and street lighting that is privately owned is not included in the contact voltage testing program, as per the Safety Standards. The contact voltage testing criteria include all municipally owned metal pole streetlights, traffic signals, and pedestrian crosswalk signals located on publicly accessible thoroughfares and areas that have streetlights directly supplied by the Company. All contact voltage testing of street lights is performed at night while the fixtures are energized.
- *Substations* Con Edison's 103 substations are located within 71 properties which are inspected and tested for contact voltage every five years. The contact voltage testing criteria consist of perimeter fencing and other electrically conductive materials where such materials are accessible to the general public. These materials include but are not limited to fences, doors, roll-up gates, metallic delivery boxes, dielectric fluid delivery ports and Siamese connections.
- Unit Substations Con Edison's 232 4kV multi-bank and unit stations are required to be inspected and tested for contact voltage every five years. The contact voltage testing criteria consist of perimeter fencing and other electrically conductive materials where such materials are accessible to the general public. These materials include but are not limited to fences, doors, roll-up gates, metallic delivery boxes, and Siamese connections.
- Overhead Transmission Con Edison's overhead transmission system includes 1,220 individual poles or towers. These transmission structures support circuit voltages of 69 kilovolts and greater. Structures that support circuits of lower voltage in addition to the transmission voltage levels are included in this category. Con Edison's overhead transmission structures are inspected and tested for contact voltage every five years. The contact voltage testing criteria include all structures, guys, and down leads attached to these structures.
- Underground Transmission Con Edison's underground transmission system includes approximately 2,200 facilities. These transmission facilities support circuit voltages of 69 kilovolts and greater. Con Edison's underground transmission facilities are inspected and tested for contact voltage every five years or sooner.

IV. Contact Voltage Testing Program

The Safety Standards require that Con Edison complete annual contact (stray) voltage testing of all underground electric distribution facilities and streetlights by December 31 of each year.

In accordance with the contact voltage testing frequencies of the Safety Standards, all underground electric distribution facilities were tested as well as all municipally owned metallic streetlights and traffic signals located on thoroughfares or areas that are publicly accessible and directly supplied with electricity by the Company.

In addition, and in compliance with the Safety Standards, Con Edison:

- Immediately safeguarded and/or mitigated all voltage findings greater than or equal to 1.0 volt. The Company uses its best efforts to effectuate a permanent repair within 45 days to all Company-owned equipment determined to have caused a voltage finding that remains necessary to provide our customers with safe and reliable service. Any permanent repairs not effectuated within 45 days are periodically monitored and tracked to completion. In instances where the contact voltage finding was determined to be caused by equipment that is not owned by Con Edison, the Company, after making the area safe, notified a responsible person associated with the premises of the unsafe condition and the need for the owner to arrange for a permanent repair.
- Tested all publicly accessible structures, streetlights, sidewalks and metal objects within a 30-foot radius of an energized structure, or contact voltage finding greater than or equal to 1.0 volt.
- Responded to, investigated and mitigated positive findings of shock incidents reported by the public.

Training

Con Edison manages its contact voltage testing program and uses both Company field personnel and contractor forces to conduct the testing of utility-owned electric facilities and municipal streetlights.

Training for the contact voltage testing program consists of an eight-hour class at our training facility for contractor forces and on-the-job training, performed by Supervisors, for Company field forces. The training is based on Company specifications on how to properly test an electric facility for contact voltage. Topics covered in the training are:

- The PSC Safety Standards
- Scope of the contact voltage testing program
- Performing the test and completing the testing form
- Data entry process
- Status of contact voltage testing to annual goal
- Abnormal systems conditions to be reported
- Performance mechanism

Underground Distribution Contact Voltage Testing

Of the total population of approximately 266,000 underground facilities, 135,858 were fielded for manual testing. The remaining facilities were tested under the mobile contact voltage program. Of the 135,858 underground facilities visited during manual testing, 74 did not require contact voltage testing due to inaccessibility, structures retired, or customer owned structures. Inaccessible underground facilities include:

- a. *Locked Gate/Fence* Structures behind locked gates and fences that are not accessible to the public, i.e., facilities located in fenced areas owned by other utilities, such as water companies.
- b. *Company Property* Structures located on Company property, such as substations, that are accessible only to Company personnel and authorized contractors.
- c. *Construction* A structure located within a construction site. These structures are accessible only to construction personnel.
- d. *Buried* A structure below grade that requires excavation to access the structure.
- e. *Vaults* Structures located inside buildings. These structures are accessible only to Company and building maintenance personnel.
- f. *Highway* Structures located on highways and on exit and entrance highway ramps. The performance of contact voltage testing would constitute an unacceptable risk to the employee.

Underground Residential Distribution (URD) System

Contact voltage testing for the URD system is conducted concurrently with the safety inspection program. Of the population of approximately 17,000 URD facilities, 2,821 facilities were visited and tested for contact voltage in 2018.

Overhead System Contact Voltage Testing

Contact voltage testing for the Overhead system is conducted concurrently with the safety inspection program. Of the population of approximately 270,000 overhead facilities, 24,135 facilities were visited and tested for contact voltage in 2018.

Streetlight and Traffic Signal Contact Voltage Testing

Of the total population of approximately 185,000 streetlight and traffic signal facilities, where the Company directly supplies electric service and which are located on public thoroughfare, approximately 110,485 facilities were required to be tested manually. The remaining facilities were tested under the mobile contact voltage program. Of the facilities visited, 314 did not require contact voltage testing because these structures were not publicly accessible or were retired. Inaccessible streetlights and traffic signals include:

- a. *Construction* A structure located within a construction site. These structures are only accessible to construction personnel.
- b. *Restricted Access* Structures located within areas with active public improvement efforts or the World Trade Center.
- c. *Highway* Structures located on highways or access roads to highways

Underground Transmission Contact Voltage Testing

Contact voltage testing for the Underground Transmission system is conducted concurrently with the safety inspection program. Of the total population of approximately 2,200 underground transmission facilities, 142 were fielded for manual testing. Those facilities that are not publicly accessible do not require contact voltage testing. Inaccessible transmission facilities include:

- a. *Construction* A structure located within a construction site. These structures are only accessible to construction personnel.
- b. *Con Edison Property* Structures located on or adjacent to Con Edison properties which are secured from the public via fencing or other barriers and are inaccessible to the public.
- c. Bridges Structures located on bridges, such as bridge joints.
- d. Buried A structure below grade that requires excavation to access the structure.

Overhead Transmission Contact Voltage Testing

Contact voltage testing for the Overhead Tranmission system is conducted concurrently with the safety inspection program. Con Edison visited and tested all of the 1,220 Overhead Transmission facilities on the Company's overhead transmission system.

Mobile Contact Voltage Testing

In accordance with the PSC's "Order Establishing Rates for Electric Service," issued March 25, 2008 in Case 08-E-0539, Con Edison performed 12 underground system scans in the underground distribution areas of New York City using mobile contact voltage detection technology. In accordance with the PSC's "Order Adopting Changes to Electric Safety Standards," issued December 15, 2008 in Case 04-M-0159, the 12 underground system scans must be performed within each rate year (April 1st to March 31st). Furthermore, Con Edison performed one additional underground system scan using mobile contact voltage detection technology in New Rochelle, Yonkers, and White Plains, as ordered in Case 10-E-0271. Con Edison also performed an underground system scan in Mount Vernon.

Results of the 2018 Contact Testing Program

The results of the 2018 Contact Testing Program are provided in the following appendixes to this report:

- Appendix 1 titled, "Summary of MANUAL Contact Voltage Testing"
- Appendix 2a titled, "Summary of Energized Objects Mobile Testing"
- Appendix 2b titled, "Summary of Energized Objects Manual Testing + Other"
- Appendix 3 titled, "Summary of Shock Reports from the Public."

V. Facility Inspection Program

The Commission's Safety Standards require that the Overhead Distribution Facilities, Underground Residential Distribution (URD) Facilities, Underground and Overhead Transmission Facilities and Substations be inspected at least once every five years. The first five-year cycle covered the period from 2005 through 2009. The second cycle is the period from 2010 through 2014. The third cycle covers the period 2015 through 2019. The Safety Standards also require that utilities inspect a minimum number of electric facilities each year of the five-year cycle based on an annual percentage of total electric facilities as follows: 17 percent in the first year, 18 percent in the second year, and 19 percent in the third, fourth and fifth years except that by the end of every fifth year, the utility must ensure that it has inspected 100 percent of its facilities. A utility may inspect its facilities pursuant to a compressed schedule and complete its inspection cycle prior to the end of the five-year period so long as the cumulative number of inspections at the end of any year is at least the minimum number required by the annual target formula -17 percent in first year, 35 percent by end of second year, 54 percent by end of third year, 73 percent by end of fourth year, and 100 percent by end of fifth year.

For Underground Distribution Facilities, Con Edison's pilot program adopted in Case 16-E-0060 extends the inspection cycle to eight yearswhich covers the period from 2015 to 2022. The minimum number of inspections to be completed on a yearly basis for this eight-year pilot program is based on an annual percentage of total electric facilities as follows: 10.6% in the first year, 21.9% in the second year, 33.8% in the third, 45.7% in the fourth year, 57.5% in the fifth year, 69.4% in the sixth year, 81.3% in the seventh year and 100% in the eight year.

In addition, the Safety Standards require that defective equipment found during an inspection be repaired. In accordance with the Safety Standards, Con Edison uses the following severity levels to establish priority for repairs and scheduling:

- *Level I* Repair as soon as possible but not longer than one week. A Level I deficiency is an actual or imminent safety hazard to the public or poses a serious and immediate threat to the delivery of power. Critical safety hazards present at the time of the inspection shall be guarded until the hazard is mitigated.
- Level II Repair within one year. A Level II deficiency is likely to fail prior to the next inspection cycle and represent a threat to safety and / or reliability should a failure occur prior to repair.
- *Level III* Repair within three years. A Level III deficiency does not present immediate safety or operational concerns and would likely have minimum impact on the safe and reliable delivery of power if it does fail prior to repair.
- *Level IV* Condition found but repairs not needed at this time. Level IV is used to track atypical conditions that do not require repair within a five-year timeframe. This level is used for future monitoring purposes and planning proactive maintenance activities.

In accordance with the Safety Standards, when a temporary repair is located during inspection or performed by the Company, best efforts are put forth to make a permanent repair of the facility within 90 days.

Training

Con Edison manages its inspection program and uses both company field personnel and contractor forces to conduct the inspection of utility owned electric facilities.

Training of the contractor force utilized to perform inspections on our overhead and underground systems consists of classes at our learning facility as well as on-the-job training performed by Contractor Oversight Supervisors who have attended a train-the-trainer session with a Con Edison Subject Matter Expert (SME). For Company field forces, the training is based on Company specifications on how to properly inspect an electric facility which is acquired through their promotional classes, as well as on-the-job training performed by their supervisor.

In addition to the above, the System & Program Engineering, Analysis and Reporting (SPEAR) department of Distribution Engineering conducted train-the-trainer sessions in each of the major workout locations since the inception of the program. The participants included the managers, planners, and supervisors of the crews that would be performing the inspections. The SPEAR Team has also conducted various training seminars at all of the major work-out locations which included the following topics:

- The PSC Safety Standards
- Scope of the inspection
- Completing the inspection form
- Data entry process
- Status of inspections to annual goal
- Repairs pending
- Accounting of the inspection
- Performance mechanism

In addition to the train-the-trainer sessions, an E-Learning Training Module was developed. This training module can be accessed from any computer on the Con Edison Network. This class is also part of the curriculum in career advancement for new mechanics.

Results of the 2018 Facility Inspection Program

The results of the 2018 Facility Testing Program and associated facility repairs are provided in Appendix 4, "Summary of Deficiencies and Repair Activity Resulting from the Inspection Process."

VI. Annual Performance Targets

Con Edison performed the required contact voltage testing and facility inspections in accordance with the requirements of the Commission's Safety Standards.

This being the fourth year of the third cycle ending December 31, 2019, Con Edison has cumulatively inspected 77.1% of its overall population of electric facilities. The percentages of inspections through December 31, 2018 by structure category are summarized in Table 1. Con Edison does not own streetlight facilities --these facilities are owned by the City of New York and by the municipalities in Westchester.

Con Edison inspects its underground transmission system at multiple intervals all in less than 5 years. The data in Table 5 captures all inspections performed during 2018. The total number of underground facilities to be inspected is approximately 2,200.

Con Edison inspects the overhead transmission facilities (Table 3); Unit substations and multi-banks (Table 7) every year.

Category	Actual Cumulative Inspected as of 2018
Overhead Distribution	97.8%
Overhead Transmission	100%
Underground Distribution	55.3%
Pad Mount (URD) Distribution	84.5%
Underground Transmission	100%
Substation	84.5%
Unit Substations	100%
Company-owned Streetlights	N/A

VII. Certifications

Pursuant to Section 7 of the Safety Standards, attached as Exhibit 1 of this report are the certifications of Con Edison's officer with direct responsibility for overseeing contact voltage testing and facility inspections indicating that Con Edison has, to the best of the officer's knowledge, exercised due diligence in carrying out a plan, including quality assurance, that is designed to meet the contact voltage testing and inspection requirements in 2018, and that Con Edison has:

- Tested its publicly accessible electric facilities and street lights in accordance with the Electric Safety Standards Case 04-M0159 effective January 13, 2015.
- Inspected the requisite number of electric facilities.

VIII. Analysis of Causes of Findings and Contact Voltage

All New York State utilities prepare an inventory of all Contact Voltage "findings" and report each year. Section 1(f) of the Safety Standards defines a "finding" as "any confirmed voltage reading on an electric facility or streetlight greater than or equal to 1 volt measured using a volt meter and 500 ohm shunt resistor." Section 1(c) defines Stray Voltage (referred to herein as Contact Voltage) as "voltage conditions on electric facilities that should not ordinarily exist. These conditions may be due to one or more factors, including, but not limited to, damaged cables, deteriorated, frayed, or missing insulation, improper maintenance, or improper installation."

Although not all findings are due to contact voltage, NYS Utilities are required to report on all findings, regardless of whether the voltage is normal to the operating system. In 2018, 8,806 voltage findings resulted from contact voltage testing. These findings resulted from 2,623 sources of contact voltage. A total of 8,664, approximately 98.4% of these findings, were detected by the Mobile Contact Voltage Testing Program. There were 142 findings (1.6%) identified by manual contact voltage testing.

In accordance with the Safety Standards requirements, when a finding is discovered on an electric facility or streetlight during contact voltage testing, the Company must manually test all publicly accessible structures, streetlights, and sidewalks, within a minimum 30-foot radius of the energized object. Two findings were recorded as a result of the 30-foot radius testing during manual contact voltage testing.

Contact voltage findings resulted from a variety of conditions including deterioration of conductors and insulation, damaged neutrals and connections, and defective customer equipment. Table 9 contains a breakdown of the 2018 sources of contact voltage findings that were Con Edison's responsibility.

Mitigation through Detection

Five factors affect the likelihood that a member of the public or an animal could experience a shock. These factors are the number of energized structures (ENEs), voltage levels associated with the ENEs, population density, the location or targeting of the mobile system scan and the weather. Appendix 3 contains the breakdown of electric shocks (ESRs) reported to Con Edison in 2018.

Since the likelihood of an ESR will increase or decrease in proportion to the total number of energized structures, the detection and repair of identified sources of contact voltage is the principal mitigation effort for reducing ESRs. Each completed repair effectively represents a mitigation of possible a ESR and over time, potential ESRs decrease accordingly. As can be observed in Chart 1, the sources of ENEs have been decreasing since the inception of the program. Similarly, the ESRs that are the responsibility of Con Edison (Chart 2) and Non-Utility responsibility ESRs (Chart 3) show a similar trend.

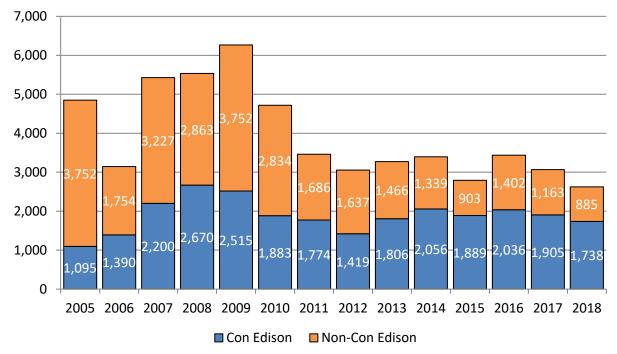

Chart 2 Con Edison ESRs

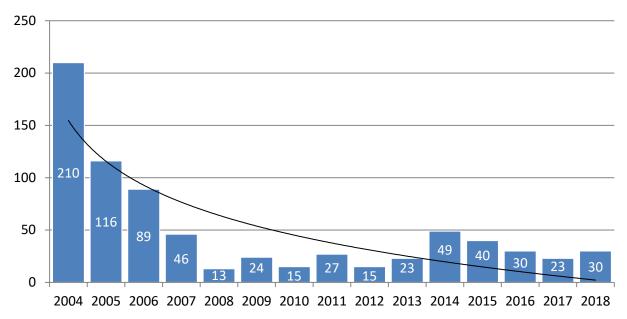

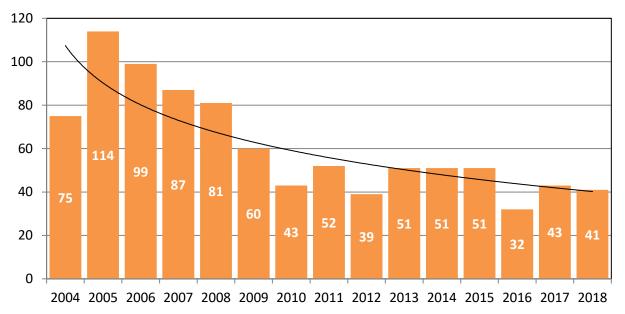

Chart 3 Non-Company ESR

Weather continues to have a direct impact on the electrical system. As has been discussed in prior annual reports, the Company continues to observe a strong correlation between weather and shocks. While there have been five consecutive years of harsh winter conditions and over 800 kilotons of additional salt spread as compared to the prior five years, the ESRs are showing a downward trend over the same period. Part of the reduction is attributed to the "Targeted Mobile" pilot program under which additional mobile scans were performed in areas that historically have had higher event activity. This program resulted in the discovery and repair of additional ENEs which could have potentially resulted in ESRs.

IX. Analysis of Inspection Results

Table 11 details the number of annual inspections performed for each facility type for the current 2015-2019 cycle.

	cycle 5 - 1	- • • • • • • • • • • • • • • • • • • •	promon 2				
Facility Inspection Program	2015	2016	2017	2018	2019	5-Year Cumulative Unique Inspections	Percent Completed
Distribution Underground*	55,320	53,989	21,596	16,471		147,376	55.3%
Distribution URD	9,593	1,257	1,158	2,821		14,829	84.4%
Distribution Overhead	114,594	84,979	40,042	24,135		269,704	97.8%

Transmission Overhead	1,220	1,220	1,220	1,220		1,220	100%
Area Substations Fences	16	15	15	14		60	84.5%
Unit Substations	232	232	232	232		232	100%
Total	181,682	142,297	65,009	45,035		435,621	77%

Table 11Cycle 3 - Yearly Inspection Breakdown

* Distribution Underground is on an 8-year inspection cycle

Tables 12 through 15 show the number of deficiencies found in each inspected structure in 2018 by defect level. For example, Table 12 shows that 0.89% of the total defects found in the overhead were Level I and they were found on 156 overhead structures. Because a structure can have more than one defect, the same structure may be counted multiple times in different defect levels. Hence, the total number of structures in each of the tables is not the unique number of structures inspected. In addition, the table does not show the structures that had no defects.

Table 12 Overhead Distribution Breakdown of Locations with Deficiencies

1	0	0	0.0%
2	0	0	0.0%
3	6	6	8.82%
4	58	62	91.18%
Total:	64	68	100%

Streetlights

Con Edison does not own streetlight facilities. Streetlight facilities within the Company's service area are owned by the City of New York and municipalities located in Westchester County.

Repair of Deficiencies

During 2018, the Company repaired 60.3% of the Level I, II, and III defects found: 99.3% Level I; 79% Level II and 23.1% Level III. Furthermore, as part of the pilot enhancement plan to the Structure Inspection Program, the Company repaired an additional 15,575 Level II and III deficiencies towards eliminating the backlog of repairs.

I	Deficiencies Repaire	d in 2018	
	Repaired Deficiencies that were Generated before 12/31/2017	Repaired Deficiencies that were Generated in 2018	Total Completed Repairs
Underground Facilities	15,575	15,683	31,258
Overhead Facilities	7,922	250	8,172
Pad Mount (URD) Facilities	415	1,345	1,760
Total	23,912	17,278	41,190

Table 16

There are no Level I deficiencies pending for the Underground or Overhead Facilities. There are 23 Level I deficiencies pending repair in the Pad Mount URD: twenty are missing or defective grating bolts; one is locks not installed and two are transformers off-center.

Temporary Repairs

There are 3 URD Level I temporary repairs over 90 days.

Analysis of Defects Found

Chart 5 shows the number of defects found per inspection by classification level. The generation rate of L1 defects found this year is comparable to last year. Level III defects have decreased by 7% and Level II defects shows an increase mainly driven by "Unsealed Secondary End Caps" and "Unsealed Service Ducts".

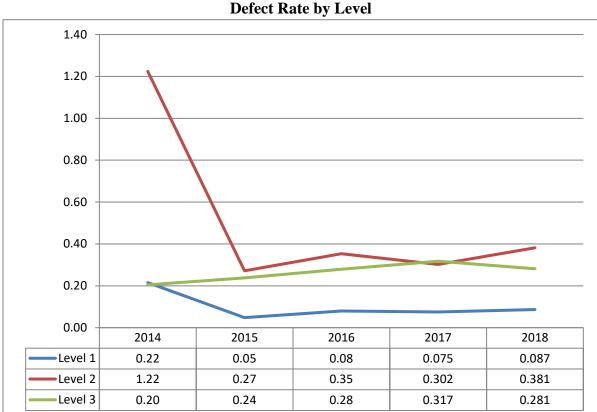

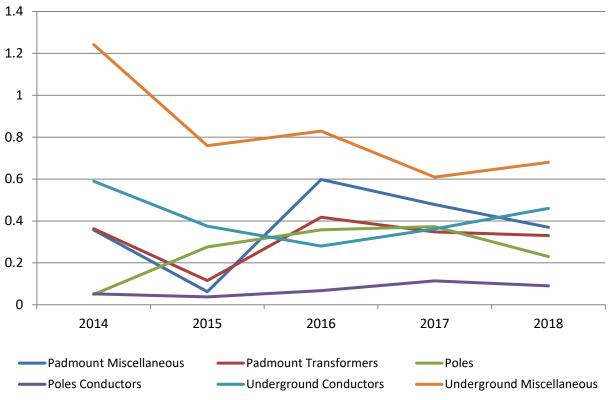

Chart 5 Defect Rate by Level

Chart 6 shows the 2018 Defect Rate by Category. The rate of defects increased in two categories: Underground Conductors and Underground Miscellaneous. The main driver in the Underground Miscellaneous category was Improperly Sealed End Caps and Unsealed Service Ducts (83% of defects). Finally, the increase in the Underground Conductors category was driven by Exposed Conductors and Damaged Secondary Service which makes 40% of the defects.

Chart 6 Defect Rate by Category

*Note: Padmount includes all URD assets (Padmounts, silos, splice boxes, etc.)

X. Quality Assurance

The Safety Standards require electric companies to develop a quality assurance program to "ensure timely and proper compliance with these safety standards." Con Edison has developed a comprehensive quality assurance program to address the contact voltage testing and facility inspections requirements. The quality assurance program includes:

- Contact voltage testing of underground distribution structures including Underground Residential Distribution (URD), overhead distribution structures and municipality-owned streetlights
- Contact voltage testing of transmission and substation facilities
- Facility inspections of underground distribution, URD, and overhead distribution structures
- Facility inspections of transmission facilities and substation facilities

This section addresses Con Edison's quality assurance program for the above-referenced contact voltage testing and facility inspections.

Quality Assurance Measures Instituted: Contact Voltage Testing of Underground Distribution Structures, Overhead Distribution Structures, and Municipality Owned Streetlights.

Con Edison developed a quality assurance plan to review whether contact voltage testing was performed as specified. The reliability and error design parameters used were:

• 95% reliability within a $\pm 10\%$ relative precision level and satisfy established industry sample design criteria.

Based on the total inspections performed in 2018, 598 quality assurance checks were required on all tested structures to achieve a 95% confidence rate with a $\pm 10\%$ overall error that the contact voltage tests were conducted in accordance with Company specifications.

The Company's specification EO-10315 (Quality Assurance of the Contact (Stray) Voltage and Periodic Distribution Structure Safety Inspection Programs) calls for quality assurance checks to be performed on the contractor contact voltage testing. The quality assurance checks are randomly selected from a database of all contact voltage tests and include a field test for contact voltage. Con Edison performed 145 quality assurance checks of the underground distribution structures including underground residential distribution (URD), 278 quality assurance checks of overhead distribution structures and 175 quality assurance checks of municipally owned streetlights. Contact voltage was not found during any of these quality assurance reviews. In addition to the 598 quality assurance checks discussed above, Con Edison also conducted Random Quality Assurance reviews of "work in progress."

Quality Assurance Measures Instituted: Contact Voltage Testing of Transmission and Substation Facilities.

In accordance with CE-ES-1043, a planner in Transmission Line Maintenance who has knowledge and expertise in overhead transmission, but who did not perform or directly supervise the contact voltage testing, conducted quality assurance inspections at locations on various transmission lines for overhead transmission facilities. Contact voltage was not found during any of these quality assurance reviews.

Con Edison performed several types of quality assurance on the underground transmission contact voltage-testing program. Contractors, who also performed testing on underground distribution structures, performed the contact voltage testing of underground transmission facilities. Following this contact voltage testing, Con Edison Construction Management personnel performed audits at several locations. Contact voltage was not found during any of these quality assurance reviews.

Con Edison's Asset Management Engineering group performed quality assurance for the substation contact voltage-testing program. The quality assurance consisted of a documents

search, records review, as well as physical contact voltage testing. Contact voltage was not found during any of these quality assurance reviews.

Quality Assurance performed a quality review on a randomly selected sample of unit substations. Contact voltage was not found during any of these quality assurance reviews.

These QA checks confirmed the accuracy of the results from the Contact voltage-testing program.

Quality Assurance Measures Instituted: Inspections of Underground Distribution Structures and Overhead Distribution Structures.

A Central Quality Assurance group (QA) was established to oversee work done on the underground electrical system. QA observes specification compliance of the underground inspection program. The Company's specification EO-10315 (Quality Assurance of the Contact Voltage and Periodic Distribution Structure Safety Inspection Programs) establishes standards for the QA program in order to ensure that the underground structure inspections are performed in accordance with the Safety Standards and Con Edison's specifications. The reliability and error design parameters used were:

• 95% reliability within a $\pm 10\%$ relative precision level and satisfy established industry sample design criteria.

Based on the total inspections performed in 2018, 575 quality assurance checks were required to achieve a 95% confidence rate with a $\pm 10\%$ overall error that the inspections were conducted in accordance with Company specifications.

Con Edison employees from the centralized quality assurance department conduct the quality assurance for each of the Company's operating regions. These employees are experienced cable splicers, linemen and mechanics that have been trained in facility inspection and the quality assurance specifications.

The quality assurance personnel performed a complete re-inspection of 400 underground and 175 overhead facilities. The results of the inspections of the randomly selected facilities are compared with the results of the previous inspected of those facilities. Deficiencies identified during quality assurance reviews are communicated to field crews, supervisors, planners, and managers who have been required to reinforce inspection procedures with field crews.

Quality Assurance Measures Instituted: Transmission and Substation Facility Inspections.

Company specifications CE-TS-6830 (Low and Medium Feeder Pressure Periodic Inspection Procedure) and CE-TS-6045 (Inspection and Preventive Maintenance and Contact Voltage Testing of Pipe Type Cable Systems) require that quality assurance inspections of randomly

selected transmission manholes be performed. These randomly selected manholes are reinspected or re-tested by trained and knowledgeable employees who did not perform or directly supervise this work.

Substation Operations' quality assurance program consists of periodic document reviews and field observations to ensure that 100% of the required contact voltage tests and a minimum of 20% of the Safety and Reliability Inspections of Substation facilities will be completed by December 31 of each year and that the testing and inspections are properly conducted.

Quality assurance was performed by members of the Asset Management Engineering group and consisted of a documents search, records review, and physical critical visual inspection. Critical visual inspection quality assurance was also performed. In addition, all inspection and follow-up work order documentation was reviewed. Work orders are entered into the Company's work management system and processed by appropriate personnel. These work orders are tracked closely until all repairs are completed. All personnel are trained on proper reporting and referral of repairs identified during facility inspections. The quality assurance inspections yielded results indicating that the original inspections were performed in accordance with the applicable specifications.

XI. Other Pertinent Information

Con Edison continues to develop its public safety programs through analytic and technical innovation, and through strategic academic and industry partnerships. In 2018, the Company installed over 2,000 Structure Monitors within the Electric Distribution System.

As part of the pilot enhancement plan for Con Edison's Structure Inspection and Repair Program, the Company performed enhanced inspections which included infrared scanning and ampere testing. These enhanced inspections resulted in the identification and repair of over 200 locations in 2018 for "hot spots," which are an indication of possible future manhole events. In addition, mobile scans targeting high-activity areas were also successfully performed detecting more than 1,400 energized objects that are included in the results listed in Table 2a. More broadly, the goal of targeted scanning is to reduce shocks and while there was an increase in utility shocks from 2017 to 2018 (23 to 30) and an increase in non-utility shocks (43 to 47), when weather is accounted for, a linear regression would have predicted 34 utility and 50 non-utility shocks in 2018 based on a salt distribution of approximately 384 kilotons. Thus Con Edison can conclude that our inspection and repair programs are effective at improving Public Safety. Appendices

EXHIBIT 1 - CERTIFICATION

This page is intentionally left blank.

Certification of Contact Voltage Testing

Patrick G. McHugh, on this 15^{H} day of February 2019, certifies as follows:

1. I am Vice President of Consolidated Edison Company of New York, Inc. ("Con Edison" or "the Company").

2. I am responsible for overseeing Con Edison's contact voltage testing program, and in that capacity I have monitored the Company's contact voltage testing program during the twelve months ended December 31, 2018 ("the twelve month period"). During the twelve-month period, Con Edison instituted and diligently carried out a program designed to meet the contact voltage testing requirements of the Public Service Commission's Safety Standards, issued in Case 04-M-0159, Proceeding Instituting Safety Standards.

3. To the best of my knowledge, information, and belief, during the twelve month period, Con Edison identified and tested for contact voltage (i) all publicly accessible electric facilities owned by the Company, and (ii) all publicly accessible streetlights and traffic signals located in public thoroughfares in the Company's service territory and directly supplied by the Company as identified through a good faith effort by the Company, except for such facilities that are identified in the Company's Annual Report, submitted herewith.

Certification of Inspections

Patrick G. McHugh, on this 15^{-4} day of February 2019, certifies as follows:

1. I am Vice President of Consolidated Edison Company of New York, Inc. ("Con Edison" or "the Company").

2. I am responsible for overseeing Con Edison's electric facility inspection program, and in that capacity I have monitored the Company's inspection program during the twelve months ended December 31, 2018 ("the twelve-month period"). During the twelve-month period, Con Edison instituted and diligently carried out a program designed to meet the inspection requirements established by the Public Service Commission's Safety Standards, issued in Case 04-M-0159, Proceeding Instituting Safety Standards.

3. To the best of my knowledge, information, and belief, Con Edison has visually inspected the requisite number of electric facilities during the twelve-month period, including the requirement to have conducted a visual inspection of at least 77% of its electric facilities through December 31, 2018.
