Q. Please state the names of the members on this New York State Electric & Gas Corporation Deliveries and Revenues / Revenue Decoupling Mechanism Panel (“Panel”).

A. We are Margaret A. George, David L. Houlihan, Michael J. Purtell, Laura J. Wakefield, and Shari M. Wells.

Q. Ms. George, please state your title and business address.

A. I am a Lead Analyst - Sales and Load Forecasting in the Rates and Regulatory Economics Department. My business address is 18 Link Drive, Binghamton, New York 13902.

Q. Please summarize your work experience and educational background.

A. My Curriculum Vitae (“CV”) is set forth in Exhibit \_\_ (NYSEGDRRDMP-1).

Q. Have you previously testified in other proceedings before the New York State Public Service Commission (“PSC” or the “Commission”) or any other state or federal regulatory agency?

A. Yes. I testified in the most recent cases for New York State Electric & Gas Corporation (“NYSEG” or the “Company”) and Rochester Gas and Electric Corporation (“RG&E” and together with NYSEG, the “Companies”), Cases 15-E-0283 et al. (the “2015 Rate Case”).

Q. Mr. Houlihan, please state your title and business address.

A. I am a Lead Analyst in the Rates and Regulatory Economics Department. My business address is 18 Link Drive, Binghamton, New York 13902.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. Please summarize your work experience and educational background.

2 A. My CV is set forth in Exhibit \_\_ (NYSEGDRRDMP-1).

3 Q. Have you previously testified in other proceedings before the Commission or any other  
4 state or federal regulatory agency?

5 A. Yes. I testified in the 2015 Rate Case.

6 Q. Mr. Purtell, please state your title and business address.

7 A. I am the Manager of Sales and Load Forecasting in the Rates and Regulatory Economics  
8 Department. My business address is 18 Link Drive, Binghamton, New York 13902.

9 Q. Please summarize your educational background and work experience.

10 A. My CV is set forth in Exhibit \_\_ (NYSEGDRRDMP-1).

11 Q. Have you previously testified in other proceedings before the Commission or any other  
12 state or federal regulatory agency?

13 A. Yes. I testified in Cases 03-E-0765 et al., 05-E-1222, 09-E-0715 et al., as well as the  
14 2015 Rate Case. In addition, I was a witness for Central Maine Power Company in  
15 Dockets No. 2013-00168 and 2018-00194 and I was a witness for Maine Natural Gas in  
16 Docket No. 2015-00005 before the Maine Public Utilities Commission.

17 Q. Ms. Wakefield, please state your title and business address.

18 A. I am a Lead Analyst in the Rates and Regulatory Economics Department. My business  
19 address is 18 Link Drive, Binghamton, New York 13902.

20 Q. Please summarize your work experience and educational background.

21 A. My CV is set forth in Exhibit \_\_ (NYSEGDRRDMP-1).

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. Have you previously testified in other proceedings before the Commission or any other  
2 state or federal regulatory agency?

3 A. No.

4 Q. Ms. Wells, please state your title and business address.

5 A. I am a Lead Analyst in the Rates and Regulatory Economics Department. My business  
6 address is 18 Link Drive, Binghamton, New York 13904.

7 Q. Please summarize your work experience and educational background.

8 A. My CV is set forth in Exhibit \_\_ (NYSEGDRRDMP-1).

9 Q. Have you previously testified in other proceedings before the Commission or any other  
10 state or federal regulatory agency?

11 A. Yes. I testified before the Commission in Cases 09-G-0716 and the 2015 Rate Case.

12 Q. What is the overall purpose of the Panel's testimony?

13 A. The Panel discusses five topics in our testimony. First, we will present NYSEG's  
14 forecast of monthly electric deliveries and customers for the period April 1, 2020 through  
15 March 31, 2021 (the "Rate Year"). The second topic of our testimony is electric  
16 revenues. Specifically, the Panel will present the electric delivery revenue forecast for  
17 the Rate Year based on currently effective base delivery rates, establish a link between  
18 the historical Test Year (i.e., the twelve months ending December 31, 2018) and the Rate  
19 Year (i.e., the twelve months ending March 31, 2021), and explain the revenue  
20 adjustments. Third, the Panel will present the Company's forecast of monthly natural gas  
21 deliveries and customers for the Rate Year. The fourth topic of our testimony is natural  
22 gas revenues. Specifically, we will present the natural gas delivery revenue forecast for

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 the Rate Year based on currently effective delivery rates, establish a link between the  
2 Test Year and the Rate Year, and explain the revenue adjustments. Additionally, the  
3 Panel will discuss the Company's electric and gas Revenue Decoupling Mechanisms  
4 ("RDMs") and Gas Enhancement Performance Incentive.

5 Q. Please summarize how the current economic conditions have affected NYSEG's  
6 deliveries.

7 A. The territories NYSEG serves have, in general, rebounded from the 2008 recession.  
8 Annual Electric Deliveries, weather-normalized, in 2018 were 15.7 GWhs. Deliveries  
9 did not recover to 2008 levels until 2013. Based on Moody's Analytics' projection for  
10 Total Upstate Real Gross State Product, the Upstate New York economy will grow  
11 modestly over the next decade. The Electric Deliveries forecast also reflects the positive  
12 impact of State Policy goals on expanding energy efficiency, reducing customer demand  
13 and growing Distributed Energy Resources ("DER"). Due to overall energy efficiency  
14 improvements and customer behind the meter photovoltaic ("PV") installations, Electric  
15 Deliveries are forecasted to decrease slightly over the next few years.

16 **II. IDENTIFICATION AND SUMMARY OF EXHIBITS**

17 Q. Is this Panel sponsoring any exhibits?

18 A. Yes. This Panel sponsors the following exhibits:

- 19 1) Exhibit \_\_ (NYSEGDRRDMP-1) contains the CVs of the Panel witnesses;  
20 2) Exhibit \_\_ (NYSEGDRRDMP-2) includes a table showing historical Test Year sales  
21 by Account Determination ID ("AD ID") as well as the Panel's forecast for the Rate  
22 Year;

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

- 1           3) Exhibit \_\_ (NYSEGDRRDMP-3) illustrates NYSEG's electric customer and  
2           deliveries forecasts. The deliveries and customer schedules include both, actual and  
3           weather normalized, historical billed deliveries data from January 1, 2017 through  
4           December 31, 2018, and forecasted data from January 1, 2019 through March 31,  
5           2021. Forecasted adjustments based on NYSEG's Energy Efficiency Transition and  
6           Implementation Plans ("ETIP") targets, and adjustments for forecasted Net Metered  
7           ("NM") PV interconnections are in this exhibit. The exhibit also includes a chart  
8           with historical and forecasted PV interconnections;
- 9           4) Exhibit \_\_ (NYSEGDRRDMP-4) shows the electric model specifications and the  
10           results of NYSEG's validation tests of the models used to develop the forecasts of  
11           monthly electric deliveries and customers;
- 12           5) Exhibit \_\_ (NYSEGDRRDMP-5) presents historical electric delivery revenue data for  
13           2016, 2017, and the Test Year, and projected electric delivery revenue data for the  
14           Rate Year at current rates;
- 15           6) Exhibit \_\_ (NYSEGDRRDMP-6) provides information about the Company's Electric  
16           RDM;
- 17           7) Exhibit \_\_ (NYSEGDRRDMP-7) illustrates NYSEG's natural gas customer and  
18           deliveries forecasts. The deliveries and customer schedules include both, actual and  
19           weather normalized, historical billed deliveries data from January 1, 2016 through  
20           December 31, 2018, forecasted data from January 1, 2019 through March 31, 2021,  
21           and forecasted adjustments based on ETIP targets;

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

- 1 8) Exhibit \_\_ (NYSEGDRRDMP-8) shows the natural gas model specifications and the  
2 results of NYSEG’s validation tests of the models used to develop the forecasts of  
3 monthly gas deliveries and customers;
- 4 9) Exhibit \_\_ (NYSEGDRRDMP-9) presents historical gas delivery revenue data for  
5 2016, 2017, and the Test Year, and projected natural gas delivery revenue data for the  
6 Rate Year at current rates;
- 7 10) Exhibit \_\_ (NYSEGDRRDMP-10) sets out NYSEG’s Gas RDM; and
- 8 11) Exhibit \_\_ (NYSEGDRRDMP-11) provides an index of the Panel’s workpapers. A  
9 copy of the workpapers will be provided to the New York State Department of Public  
10 Service Staff (“Staff”).

11 Q. Please summarize the historical Test Year sales by AD ID as well as the Panel’s forecast  
12 for the Rate Year.

13 A. Exhibit \_\_ (NYSEGDRRDMP-2) shows NYSEG’s electric billed deliveries (MWh) and  
14 electric customers by AD ID for the Test Year and Rate Year.

15 **III. ELECTRIC DELIVERIES AND CUSTOMERS**

16 **A. Electric Deliveries Forecast**

17 Q. How did the Panel forecast monthly electric billed deliveries?

18 A. We used an econometric modeling methodology to estimate the relationship between  
19 certain explanatory, or independent, variables and the dependent variable, which, in this  
20 case, is the monthly billed electric deliveries by customer class. We examined various  
21 functional forms of the models, including linear, log-linear, semi-log linear, and log-log.  
22 The log-log form of the models produced the best model results. Best model results were

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 selected by evaluating the fit of the sample as determined by the model's summary  
2 statistics, and also the ability of the model to forecast well as demonstrated in ex-post  
3 testing.

4 Q. What is econometric modeling?

5 A. Econometric modeling applies statistical techniques, such as linear regression, to estimate  
6 the relationship between certain explanatory, or independent variables, and the dependent  
7 variable, which, in this case, is monthly deliveries data. An econometric model, also  
8 known as a linear regression model, is an estimate of a best-fit line between one  
9 dependent variable and one or more explanatory variables. The term "best-fit" refers to  
10 the line with the lowest sum of squared errors.

11 Q. Has NYSEG employed such a methodology for electric deliveries forecasting in previous  
12 rate cases?

13 A. Yes. NYSEG most recently used econometric modeling for electric deliveries  
14 forecasting in the 2015 Rate Case.

15 Q. Did the Panel use the same econometric models for this case?

16 A. The general underlying assumptions with respect to the model specifications are the same  
17 with the following exceptions. In the commercial deliveries model, Commercial  
18 Customers was used in place of Upstate Population. In the industrial model, Real Gross  
19 Domestic Product-Manufacturing was used in place of Real Gross Domestic Product.  
20 Additionally, in the industrial model, the use of the number of Manufacturing Employees  
21 was eliminated. In the municipal model, Real Disposable Income was used in place of

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Residential Customers per month. NYSEG made these changes because these variables  
2 proved to be more statistically significant.

3 Q. How did the Panel develop the econometric models?

4 A. We used a computer program called MetrixND to develop the econometric models.

5 Itron, Inc. created this forecasting software specifically for utilities. More than 100  
6 utilities and independent system operators use this software, including the New York  
7 Independent System Operator (“NYISO”).

8 Q. Did the Panel make any out of model adjustments to the residential, commercial,  
9 industrial, and municipal deliveries forecasts?

10 A. Yes. An out of model adjustment was made to the econometric forecasts to account for  
11 factors that have an effect on projected sales which cannot be adequately accounted for  
12 within the econometric model. Out of model adjustments were made to account for  
13 NYSEG’s ETIPs in the residential, commercial, industrial, and municipal deliveries  
14 forecasts. Because the expected decrease to load due to incremental ETIPs impacts is not  
15 reflected in the historical data used in our econometric models, it was necessary to make  
16 out of model adjustments to the forecasted residential, commercial, industrial, and  
17 municipal load.

18 Q. How did the Panel calculate the ETIP out of model adjustments?

19 A. NYSEG based the total out of model adjustments for ETIP in years 2019 and 2020 on the  
20 “System Energy Efficiency Plan” filed February 19, 2019 in Cases 18-M-0084 and  
21 15-M-0252 (“SEEP”). The SEEP identified annual megawatt-hour reduction targets of  
22 83,311 for 2019 and 89,262 for 2020. For years beyond 2020, we obtained estimates

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 from the NYSEG/RG&E Energy Efficiency group. The Energy Efficiency group also  
2 provided allocations of the targets by residential, commercial, industrial, and municipal  
3 revenue classes. A summary of the annual out of model adjustments by revenue class for  
4 years 2019 to 2021 can be found in Exhibit \_\_ (NYSEGDRRDMP-3). The annual targets  
5 were then allocated on a monthly basis according to each revenue class's monthly load  
6 shape.

7 Q. Did the Panel make any other out of model adjustments to the residential, commercial,  
8 industrial, and municipal deliveries forecasts?

9 A. Yes. Out of model adjustments were made to account for the impact of new installations  
10 of customer-owned PV systems in the residential, commercial, and municipal deliveries  
11 forecasts. These installations operate "behind the meter" and reduce the deliveries to  
12 these customers. The impact of new PV installations is not captured in our econometric  
13 models, and thus, it is necessary to make out of model adjustments.

14 Q. Please explain how the Panel calculated the out of model adjustment for customer-owned  
15 PV systems.

16 A. First, the Panel developed a monthly megawatt capacity forecast of new installations  
17 beginning in January of 2019. The forecast included the following types of PV  
18 installations: NM, Community Distributed Generation ("CDG") and Remote Net Meter  
19 ("RNM"). For each of these categories, we considered current pending interconnection  
20 applications, recent historical rate of interconnections and 100% paid-up pending  
21 applications. While not all pending applications become interconnected, for purposes of  
22 the forecast, NYSEG assumed that all 100% paid-up applications would be

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 interconnected in 2019. We also used forecasts by the NYISO’s 2018 Load and Capacity  
2 Data Report (p. 24) for years beyond the horizon of our current interconnection  
3 applications and established a “glide path” to meet NYSEG’s share. Exhibit \_\_  
4 (NYSEGDRRDMP-3) includes a chart and summary of actual and forecasted PV  
5 interconnections for 2012 to 2030. After establishing the monthly capacity forecast, we  
6 converted that forecast to monthly megawatt hour output with software obtained from the  
7 National Renewable Energy Laboratory (“NREL”), using Binghamton, New York as a  
8 proxy location.

9 Q. How does each of the types of PV installations affect billed deliveries?

10 A. For NM PV installations, the output will reduce load on the customer meter and thus  
11 reduce billed kilowatt hour (“kWh”) amounts to the customer. As a result, an out of  
12 model adjustment is required. For CDG and RNM PV installations, customers receive  
13 financial adjustments. Therefore, NYSEG did not include these type installations in the  
14 out of model adjustments.

15 Q. How did the Panel allocate the out of model adjustments to the residential, commercial,  
16 industrial, and municipal revenue classes?

17 A. The NYSEG/RG&E Interconnection Queue database identifies NM PV installations by  
18 residential and non-residential. We allocated residential NM PV installations to the  
19 residential class. Additionally, we allocated the non-residential NM PV installations 80%  
20 commercial and 20% municipal. The Company made no allocations to the industrial  
21 class. Monthly details of the out of model adjustments for PV are in Exhibit \_\_  
22 (NYSEGDRRDMP-3).

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. What types of explanatory variables did the Panel use?

2 A. We used five categories of explanatory variables: economic variables; price variables;  
3 weather variables; binary variables (also known as “dummy variables”); and a  
4 demographic variable.

5 Q. Why did the Panel use these five categories of explanatory variables?

6 A. Our general underlying assumption was that monthly electric deliveries are a function of  
7 these types of variables. In our experience, we have found that these variables can  
8 explain and estimate commercial, industrial, and municipal electric sales forecasts.

9 Q. How much historical data was used in the database?

10 A. We used monthly historical data from January 1980 through December 2018 for each of  
11 the major deliveries class econometric models. This historical time period allowed for  
12 sufficient degrees of freedom and efficient estimates of econometric model coefficients.  
13 The use of monthly data also improves model stability, and more properly estimates the  
14 seasonal impact of sales. For the street lighting class, monthly historical data from  
15 January 2000 to December 2018 was used. For the Interdepartmental and Borderline  
16 classes, the last 12 months of actual usage was used as the forecast.

17 Q. Please describe the economic variables category.

18 A. This category represents the fiscal health of the economy of the Upstate New York area.  
19 Among the economic variables used by NYSEG are variables for Income and Upstate  
20 New York Manufacturing and Non-Manufacturing Gross Domestic Product (“GDP”).

21 Q. How did the Panel obtain the economic variable data?

22 A. Moody’s Analytics provided all the data.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. What is Moody's Analytics?

2 A. Moody's Analytics (formerly known as Moodys-Economy.com) is a nationally  
3 recognized independent provider of economic analysis, data, and forecasting services. It  
4 has over 500 clients in 50 countries, including governments at all levels, utilities,  
5 commercial and investment banks, insurance companies, financial services firms,  
6 manufacturers, money managers, and industrial and technology constituents. Among its  
7 vast clientele are the major New York utilities, the NYISO, ISO New England, Inc., and  
8 numerous federal governmental bodies.

9 Q. When were the economic forecasts provided by Moody's Analytics that were used to  
10 prepare the Company's electric deliveries forecasts released?

11 A. We used January 2019 forecasts from Moody's Analytics.

12 Q. What are price variables?

13 A. Price variables are electric prices. The electric prices used by this Panel are the actual  
14 average retail sales prices (sales revenues divided by sales units) for each customer class  
15 during the period January 1980 through December 2018, adjusted by specific price  
16 indices or deflators. In particular, electric prices are deflated by the Consumer Price  
17 Index for the residential class, adjusted by the GDP implicit price deflator for the  
18 commercial and municipal classes, and the Producer Price Index for the industrial class.

19 Q. What are weather variables?

20 A. Weather variables measure monthly heating and cooling degree days, and variations from  
21 normal monthly heating and cooling degree days. The term "normal degree days" is  
22 defined as a rolling 10-year normal (2009-2018) of degree days ending with the last

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 complete calendar year of actual data. Using a 10-year normal weather period is  
2 consistent with the U.S. Department of Energy's Energy Information Administration  
3 ("EIA") which now uses a 10-year average to define normal weather for forecasting  
4 purposes. The same approach is reflected in the Commission's Order Adopting  
5 Recommended Decision with Modifications, issued June 22, 2009 in Central Hudson's  
6 Cases 08-E-0887 et al., as well as the Companies' Joint Proposal adopted in the Order  
7 Establishing Rate Plan issued September 21, 2010 in Cases 09-E-0715 et al. (the "2010  
8 Rate Order") and the Joint Proposal adopted in the June 15, 2016 Order Approving  
9 Electric and Gas Rate Plans in Accord with Joint Proposal in the 2015 Rate Case ("2016  
10 Rate Order").

11 Q. How did the Panel obtain the weather variables?

12 A. Heating and cooling degree days were obtained from the National Weather Service for  
13 the Binghamton, Buffalo, Syracuse, Albany, and Burlington, Vermont weather stations.  
14 A composite weather variable was constructed by using a weighted average that reflects  
15 billed deliveries in each area.

16 Q. Did the Panel use any other form of weather variable?

17 A. Yes. In the residential model, a trended weather variable was created using the Billing  
18 Month Cooling Degree Day variations from normal weather and a yearly trend variable.

19 Q. What is the purpose of using this trended weather variable?

20 A. This trended weather variable was used in the model to represent the increasing use of  
21 electric air conditioning by NYSEG's residential customers. This variable was calculated

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 by multiplying the Billing Month Cooling Degree Day variations from normal weather by  
2 an integer that increased by one every fourth year.

3 Q. What are binary variables?

4 A. Binary variables take a value of “1” when a condition is present and assume a value of  
5 “0” when the condition is not present. For example, a variable called “January” takes a  
6 value of “1” in January and “0” in any other month. Binary variables are merely shape  
7 variables and do not represent any underlying trends. Monthly binary variables were  
8 used in the models to reflect the seasonality of billed electric deliveries.

9 Q. Did the Panel use any other types of binary variables?

10 A. Yes. In the commercial model, we used specific year-month binary variables for the  
11 months of March 2006 and April 2006 to correct for a billing issue between those two  
12 months. The industrial model included two binary variables to correct for apparent  
13 billing issues occurring in March 2006 and April 2006. Similarly, the municipal model  
14 included binary variables for March 2006 and April 2006, and April 2007 and May 2007  
15 to also correct for billing issues occurring in those months. Additionally, 13 specific  
16 year-month binary variables, from the period between October 2003 and April 2014,  
17 were used in the street lighting model to correct for anomalous data points resulting from  
18 apparent billing issues.

19 Q. What demographic variables did the Panel use?

20 A. The residential model used one demographic variable: the number of Residential  
21 Customers per month. The commercial model used the number of Commercial  
22 Customers per month.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. Please identify the explanatory variables that the Panel used from these five categories to  
2 develop the total electric deliveries forecast for the residential class.

3 A. We used variables representing the number of residential customers, Upstate New York  
4 Real Disposable Personal Income, Real Residential Price, Billing Month Heating-Degree  
5 Day variations from normal weather, trended Cooling Degree Day variations from  
6 normal weather, monthly binary variables, and the number of billing days in the month.  
7 Our dataset consisted of monthly historical data from January 1980 through December  
8 2018.

9 Q. What is the average annualized growth rate for the residential class total deliveries for the  
10 forecast period?

11 A. The average annualized growth rate for residential billed deliveries between the Test  
12 Year, weather-normalized, and the Rate Year is -0.1%. The Rate Year forecast includes  
13 an out of model adjustment of -40,495 MWh resulting from ETIPs, and an out of model  
14 adjustment of -15,550 MWh resulting from new PV installations. Without the impact of  
15 ETIPs and PV, the expected growth rate would be 0.2%.

16 Q. What was the next step after the residential billed deliveries forecast was created?

17 A. The residential deliveries were then allocated between service classifications (“SCs”)  
18 based on historical distributions of monthly deliveries. As discussed later in this  
19 testimony, the SC units are then used to calculate the forecasted delivery revenues at  
20 existing rates.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. What specific variables are used in the historical monthly database to develop the total  
2 electric billed deliveries forecast for the commercial class?

3 A. The database contained variables representing the number of commercial customers,  
4 Upstate New York Real Non-Manufacturing GDP, Real Commercial Price, Billing  
5 Month Heating and Cooling Degree Day variations from normal weather, monthly binary  
6 variables, and the number of billing days in the month. The Panel's dataset consisted of  
7 monthly historical data from January 1980 through December 2018

8 Q. What is the commercial class deliveries growth rate for the forecast period?

9 A. The average annualized growth rate between the Test Year, weather-normalized, and the  
10 Rate Year is -1.1%. The Rate Year forecast includes an out of model adjustment  
11 of -101,475 MWh resulting from ETIPs, and an out of model adjustment of -10,419  
12 MWh resulting from new PV installations. Without the impact of ETIPs and PV, the  
13 expected average annualized growth rate would be 0.0%.

14 Q. What did the Panel do after determining the commercial class deliveries forecast?

15 A. We then allocated the commercial deliveries units among the SCs using the historical  
16 distribution of monthly deliveries to calculate revenues.

17 Q. What particular variables did the Panel include in the historical monthly database to  
18 develop the total electric billed deliveries forecast for the industrial class?

19 A. The database consists of variables for Upstate New York Real Manufacturing GDP, Real  
20 Industrial Price, monthly binary variables, and the number of billing days in the month.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. What is the industrial class deliveries growth rate over the forecast period?

2 A. The average annualized growth rate between the Test Year, weather-normalized, and the  
3 Rate Year is -0.2%. The Rate Year forecast includes an out of model adjustment  
4 of -42,018 MWh resulting from ETIPs. Without the impact of ETIPs, the expected  
5 average annualized growth rate would be 0.4%. There was no out of model PV  
6 adjustment for the industrial class deliveries.

7 Q. How did the Panel allocate deliveries once it determined the industrial class deliveries  
8 forecast?

9 A. We allocated deliveries among the industrial SCs using historical monthly deliveries  
10 distributions for revenue calculations.

11 Q. What specific explanatory variables did the Panel use to develop the total electric  
12 deliveries forecast for the municipal class?

13 A. We used the following variables: Real Disposable Personal Income; Real Municipal  
14 Price; Billing Month Heating and Cooling Degree Day variations from normal weather;  
15 and monthly binary variables; a yearly binary variable representing the loss of a major  
16 customer; a yearly binary variable representing the implementation of the State of New  
17 York Local Property Tax Cap (“Tax Cap”) in 2012; and the number of billing days in the  
18 month. The Panel’s dataset consisted of monthly historical data from January 1980  
19 through December 2018.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. Please explain the use of a yearly binary variable representing the loss of a major  
2 customer.

3 A. In late 2009, a single large municipal customer converted most of its load from NYSEG  
4 deliveries service to self-generation, significantly reducing its required deliveries load  
5 from NYSEG. The binary variable was used to identify the succeeding period,  
6 commencing January 2010, when this customer's conversion caused a notable reduction  
7 in NYSEG's total municipal load. The municipal model now includes 108 months  
8 (January 2010 to December 2018) of diminished total municipal deliveries, which reflects  
9 the time that this customer was self-generating and receiving significantly fewer loads  
10 delivered by NYSEG. The use of this yearly binary variable allows the model to  
11 distinguish between the time period when said customer's full load was delivered by  
12 NYSEG (identified in the model as before year 2010) and when NYSEG's delivered load  
13 to this customer was significantly curtailed, and thus the model reflects this change in the  
14 forecast.

15 Q. Please explain the use of a yearly binary variable representing the implementation of the  
16 Tax Cap in 2012.

17 A. This binary variable was used for years 2012 and after to account for the impact of the  
18 Tax Cap implementation on municipal electric use. The Tax Cap was implemented to  
19 limit property tax increases, and thus municipal entities have been forced to reduce  
20 controllable expenditures, such as electric use. By using this binary variable in the mode,  
21 this step change is reflected in the forecast.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. What is the municipal class deliveries growth rate over the forecast period?

2 A. The average annualized growth rate between the Test Year, weather-normalized, and the  
3 Rate Year is 0.6%. The Rate Year forecast includes an out of model adjustment  
4 of -14,221 MWh resulting from ETIPs and an out of model adjustment of -2,605 MWh  
5 resulting from new PV installations. Without the impact of ETIPs and PV, the expected  
6 average annualized growth rate would be 1.2%.

7 Q. What was the next step after determining the municipal class billed deliveries forecast?

8 A. The deliveries were then allocated among the municipal SCs based on historical monthly  
9 deliveries distributions for revenue calculations.

10 Q. Please describe the explanatory variables that the Panel used to develop the total electric  
11 deliveries forecast for the street lighting class.

12 A. The street lighting total deliveries forecast is based upon an econometric model that  
13 utilizes the average monthly burning hours, outlined in the Company's tariff, as the main  
14 explanatory variable. Additionally, monthly binary variables were used in the model  
15 specifications. Thirteen specific year-month binary variables, from the period between  
16 October 2003 and April 2014, were also used in the street lighting model to correct for  
17 anomalous data points resulting from apparent billing issues.

18 Q. What is the growth rate over the forecast period for the street lighting class?

19 A. The average annualized growth rate between the Test Year and the Rate Year is 0.2%.  
20 There were no out of model adjustments in the street lighting class.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. What methodology did the Panel use to develop the total electric deliveries forecast for  
2 NYSEG's Interdepartmental and Borderline classes?

3 A. The Interdepartmental and Borderline deliveries forecasts are set at the actual delivery  
4 levels from the historical data for the last 12 months of actual use.

5 Q. Please summarize the total electric billed deliveries forecast for the NYSEG service  
6 territory.

7 A. Based on the forecasts that we have described, NYSEG expects that the overall electric  
8 deliveries volume will decrease, on average, by -0.4% annualized between the Test Year,  
9 weather-normalized, and the Rate Year. The electric deliveries forecast is illustrated in  
10 Exhibit \_\_ (NYSEGDRRDMP-3), Schedule A. Historical actual and weather-normalized  
11 deliveries from January 2017 through December 2018 and forecasted deliveries from  
12 January 2019 through March 2021 are presented in this exhibit. This electric deliveries  
13 forecast is based heavily on economic variables, and the forecast may need to be updated  
14 to reflect changes in economic conditions.

15 **B. Electric Customer Forecast**

16 Q. Please describe the development of the electric customer forecast for the residential  
17 customer class.

18 A. The number of residential customers is forecasted with an econometric model that uses  
19 Moody's Analytics' Upstate New York Households forecast as the main explanatory  
20 variable.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. Why is econometric modeling appropriate for the residential customer class?

2 A. For the residential customer class, the number of residential customers is highly  
3 correlated, and dependent upon, the Households in Upstate New York. This causal  
4 relationship can be very accurately estimated using econometric modeling. It follows  
5 that an accurate forecast of Upstate New York Households, as provided by Moody's  
6 Analytics, would then yield an accurate forecast of residential customers.

7 Q. What is the growth rate of residential customers over the forecast period?

8 A. The average annualized growth rate between the Test Year and the Rate Year is 0.25%.

9 Q. How did the Panel develop the electric customer forecasts for non-residential customer  
10 classes, including the commercial, industrial, municipal, and street lighting classes?

11 A. We developed those forecasts using exponential smoothing models for each of the non-  
12 residential customer classes.

13 Q. Why are exponential smoothing models appropriate for those classes?

14 A. An exponential smoothing model is a univariate, or one variable, forecasting method that  
15 is widely used in business forecasting. This methodology allows us to capture both trend  
16 and seasonal components that exist in the customer counts of these non-residential  
17 classes.

18 Q. What are the growth rates of the commercial, industrial, municipal (also known as public  
19 authority), and street lighting classes over the forecast period?

20 A. For the commercial class, the average annualized growth rate between the Test Year and  
21 the Rate Year is 0.37%. For the industrial class, the average annualized growth rate  
22 between the Test Year and the Rate Year is -3.19%. For the municipal class, the average

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 annualized growth rate between the Test Year and the Rate Year is -0.22%. Finally, for  
2 the street lighting class, the average annualized growth rate between the Test Year and  
3 the Rate Year is 0.46%.

4 Q. What are the overall results of the electric customer forecast?

5 A. The overall result of the electric customer forecast is illustrated in Exhibit \_\_  
6 (NYSEGDRRDMP-3), Schedule B. The historical actual number of customers from  
7 January 2017 through December 2018 and the forecasted number of customers from  
8 January 2019 through March 2021 are presented in the exhibit. Based on the forecasts  
9 we have described, NYSEG expects the overall number of electric customers to increase,  
10 on average, by 0.25% annually between the Test Year and the Rate Year.

11 **C. Model Validation**

12 Q. How did the Panel validate the models used to develop the forecasts of monthly electric  
13 deliveries and customers?

14 A. The Panel analyzed “Goodness of Fit” tests to determine what percentage of the variation  
15 in the dependent variable can be explained by the explanatory variables that we selected.  
16 In other words, these tests check a model’s summary statistics that may explain how well  
17 the model fits or explains a dataset. The first test statistic is called the Coefficient of  
18 Determination, better known as the R-squared. An R-squared value of 1 means that the  
19 dependent variable is, on average, completely explained by the explanatory variables,  
20 while a value of 0 means that no explanatory relationship between the dependent variable  
21 and the independent variables can be estimated from the sample data. The second test  
22 statistic is called the Mean Absolute Percent Error (“MAPE”). The MAPE is the ratio of

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 the absolute value difference between the monthly forecast value derived from the model  
2 and the actual monthly value averaged over the entire dataset of actual values. The  
3 smaller the MAPE, the better. A model that results in a high R-squared value and a small  
4 MAPE is said to have strong summary statistics. One of the most common tests for  
5 checking if a model performs well is the Ex Post forecast test. For this test, a portion of  
6 the sample is withheld and the model is estimated on the remaining sample. An estimate  
7 or forecast of the withheld data is then generated by the model which is compared to the  
8 withheld dataset. Summary statistics are analyzed to see how well the model actually  
9 forecasts the withheld sample. The primary statistic analyzed for an Ex Post test is the  
10 MAPE. We have performed Ex Post forecast tests on all customer and billed unit models  
11 presented in this testimony for two- and four-year periods to demonstrate how well the  
12 models forecast two and four years out. Exhibit \_\_ (NYSEGDRRDMP-4) summarizes  
13 the statistics for all the models.

14 Q. What are the results of the Panel's validation tests?

15 A. The test results and model specifications are shown in Exhibit \_\_ (NYSEGDRRDMP-4).  
16 They establish that the econometric models used by NYSEG for electric forecasting have  
17 very strong summary statistics, fit the datasets, and generalize well.

18 **IV. ELECTRIC DELIVERY REVENUE**

19 Q. Please describe how the forecast of Electric Billed Delivery Revenue is calculated in  
20 Exhibit \_\_ (NYSEGDRRDMP-5).

21 A. A four-step process is used to calculate the forecasted monthly Electric Billed Delivery  
22 Revenue for each customer class (e.g., residential and commercial) and service class.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1           Once the delivery revenues are calculated, they are summarized by customer class, as set  
2           forth in Exhibit \_\_ (NYSEGDRRDMP-5).

3   Q.    What is the first step?

4   A.    The first step of the electric revenue forecasting process is to incorporate the monthly  
5           forecasted deliveries and electric customers by SC and customer class, by month, into a  
6           revenue model. The monthly forecasted kWh sales are allocated to on-peak, mid-peak,  
7           and off-peak for applicable SCs based on historical distributions. Additionally, the  
8           kilowatt (“kW”) demand forecast for applicable SCs was developed by using a three-year  
9           historical ratio of kW to kWh, and then applying that ratio to the forecasted kWh units.  
10          Reactive (“rkvah”) is also developed looking at a historical ratio of rkvah to kWh and  
11          allocating that ratio to the applicable SCs.

12   Q.    Please describe the second step.

13   A.    Once the deliveries and customers have been allocated to the appropriate SC by month,  
14           the current tariff base delivery rates are applied to the forecasted monthly billing  
15           determinants to develop the Gross Base Delivery revenue amounts by SC.

16   Q.    What does the third step include?

17   A.    The forecasted deliveries, where applicable, are multiplied by the forecasted rates for  
18           Clean Energy Fund (“CEF”) Surcharge, Energy Efficiency (“EE”) Surcharge, Dynamic  
19           Load Management (“DLM”) Surcharge, and the Merchant Function Charge (“MFC”).

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. What is the final step in developing the electric revenues forecast?

2 A. The resulting tariff revenue amounts are then multiplied by the applicable state and local  
3 gross revenue tax (“GRT”) to determine the total delivery revenue amounts, per month,  
4 per SC.

5 Q. Please list and describe briefly the SCs that were used by the Company in calculating the  
6 delivery revenue.

7 A. The SCs are as follows:

8 PSC No. 120 Service Classifications:

9	SC-1	Residential Regular
10	SC-1S	Residential Seasonal
11	SC-8	Residential Day-Night
12	SC-8S	Residential Day-Night Seasonal
13	SC-12	Residential Time of Use
14	SC-6	General Service Regular
15	SC-9	General Service Day-Night
16	SC-2	General Service-w/Demand
17	SC-3P	Primary Service
18	SC-3S	Subtransmission Service
19	SC-7-1	General Service-Time of Use
20	SC-7-2	Primary Service-Time of Use
21	SC-7-3	Subtransmission-Time of Use
22	SC-7-4	Transmission-Time of Use
23	SC-11	Standby Service
24	SC-5	Outdoor Lighting

25  
26 PSC No. 121 Service Classifications:

27	SC-1	Street Lighting Service with contributory provisions 28 (grandfathered)
29	SC-2	Street Lighting Service-Customer Owned Equipment
30	SC-3	Standard Street Lighting Service
31	SC-4	Street Lighting Service-Energy Only

32  
33 Q. Please describe Exhibit \_\_ (NYSEGDRRDMP-5).

34 A. Exhibit \_\_ (NYSEGDRRDMP-5), Pages 1 through 3 of 5, show actual monthly delivery  
35 revenue for 2016, 2017, and the historical Test Year, respectively. Page 4 of 5 shows

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 forecasted monthly delivery revenue for the Rate Year. Lastly, page 5 of 5 shows a  
2 summary of the Test Year and Rate Year revenues.

3 Q. What is included in the line item Gross Base Delivery Charge?

4 A. Gross Base Delivery Charges consist of customer charges, volumetric (kWh) delivery  
5 charges, demand (kW) charges, and reactive charges. The rates used to calculate such  
6 charges incorporate the impact, effective October 1, 2018, of certain tax rate benefits  
7 associated with the Tax Cuts and Jobs Act of 2017, pursuant to the Commission's Order  
8 Determining Rate Treatment of Tax Charges, issued August 9, 2018 in Case 17-M-0815  
9 ("Tax Order").

10 Q. Please describe how economic development rate discounts are addressed in the forecast.

11 A. Currently there are no customers enrolled in the economic development rate discount  
12 programs, therefore this was not forecasted in the Rate Year.

13 Q. Please explain the RDM Charge.

14 A. The RDM Charge represents the collection or refund of revenues that were either under-  
15 collected or over-collected for each service classification in the prior RDM year.

16 Q. Is an RDM Charge included in the Rate Year revenues?

17 A. No. The Rate Year forecast assumes there were no over- or under-collections in the prior  
18 RDM year.

19 Q. What is included in the line item MFC?

20 A. The MFC represents the revenue charged to full-service customers to recover their share  
21 of credit, collection, call center, and administrative costs associated with the Company's  
22 electric commodity program.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. What does the line item labeled Energy Efficiency represent?

2 A. This line item represents a surcharge (in the Test Year) and will be included in base  
3 delivery revenues in the Rate Year providing collection of mandated costs associated  
4 with the Company's and State's energy efficiency, conservation, renewable energy, and  
5 related programs. This line item also includes collections to fund heat pump incentives.

6 Q. What does the line item labeled CEF represent?

7 A. The CEF surcharge recovers from customers the Company's payments to the State Clean  
8 Energy Fund.

9 Q. Please explain the line item labeled DLM Surcharge.

10 A. The surcharge recovers the collection of costs associated with the Company's load  
11 management and reduction programs.

12 Q. What does the GRT Surcharge represent?

13 A. This line item represents a delivery revenue surcharge that collects gross revenue taxes  
14 from customers that are subsequently remitted by the Company to New York State and  
15 various municipalities.

16 Q. What is the Bill Issuance & Payment Processing Charge ("BIPP")?

17 A. BIPP is a charge per invoice to recover the cost of billing customers and processing their  
18 payments. BIPP was unbundled from the monthly customer charge in 2007, consistent  
19 with the Commission's Order Providing for Customer Choice of Billing Entity issued on  
20 March 22, 2000 in Case 99-M-0631 ("Customer Choice Order").

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. Please explain the Purchase of Receivables (“POR”) Charge.

2 A. The POR Charge represents the revenue charged to energy service companies (“ESCOs”)  
3 through the POR discount rate to recover the credit, collection, and call center costs  
4 associated with the Company’s purchased commodity receivables.

5 Q. Please explain the line item entitled Wholesale Transmission Revenues.

6 A. This line item represents the amount of transmission revenue that is embedded in delivery  
7 rates. Any difference between actual transmission revenues and the level embedded in  
8 Delivery rates is recovered or returned through the Non-Bypassable Wires Charge  
9 (“NBC”).

10 Q. What are the primary items included in the line entitled Miscellaneous Revenue?

11 A. Miscellaneous Revenue consists primarily of reconnection and other service fees and  
12 building rental income.

13 Q. What does the line item labeled Damage and Third Party Payments represent?

14 A. This line item consists primarily of reimbursements for O&M expenditures related to  
15 make ready pole work, mutual aid services (Test Year only), and pole and property  
16 damage repair.

17 Q. What does the line item labeled Joint Use Property Rental represent?

18 A. This line item represents the pole attachment revenues from joint use poles.

19 Q. Does the Rate Year include similar revenues as the Test Year?

20 A. Yes.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. Please explain the revenue adjustments between the actual Test Year and the forecasted  
2 Rate Year revenues.

3 A. The total revenue adjustment between the Test Year and the Rate Year is a decrease of  
4 \$47,833,000, which is attributed to the following:

5 a) Gross Base Delivery Revenues – \$11,878,000 decrease primarily reflecting a full  
6 year of lower base rates delivery tariff rates for the Rate Year resulting from the  
7 Tax Cuts and Jobs Act of 2017, as compared to only three months of such lower  
8 rates in the Test Year.

9 b) RDM Charge – \$7,133,000 decrease to eliminate the Test Year refund of prior year  
10 net over-collections. The Rate Year forecast assumes no over/under collections in  
11 the preceding RDM year.

12 c) CEF Surcharge – \$4,915,000 decrease to incorporate the required level of  
13 collections in the Commission’s Order Authorizing the Clean Energy Fund  
14 Framework, issued January 21, 2016 in Cases 14-M-0094 et al. (“CEF Order”).

15 d) EE Tracker Surcharge – \$2,869,000 decrease to incorporate the required level of  
16 collections in the Commission’s Order Authorizing Utility-Administered Energy  
17 Efficiency Portfolio Budgets and Targets for 2019 – 2020, issued March 15, 2018  
18 in Case 15-M-0252.

19 e) DLM – \$2,216,000 increase to incorporate the required level of collections in the  
20 Commission’s Order Directing Tariff Filings, issued April 19, 2018 in Cases 14-  
21 E-0423 et al.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

- 1 f) GRT Surcharge – \$220,000 increase to incorporate revenue levels identified  
2 above. In addition, the Test Year includes Transition Surcharge revenues, which  
3 were negative for certain SCs. The Rate Year does not include Transition  
4 Surcharges and, as a result, the Revenue Tax is calculated on higher revenues.
- 5 g) BIPP Charge – \$11,000 increase to reflect the higher customer count in the Rate  
6 Year.
- 7 h) Late Payment Charge – \$716,000 decrease reflecting the lower level of forecasted  
8 customer revenues in the rate year.
- 9 i) Wholesale Transmission Revenues – \$4,261,000 decrease in transmission  
10 revenues, a five-year historical average was used to develop this forecast. See  
11 Table 1 for details of the Historical Revenues and the Rate Year Forecast.

12 Table 1: Wholesale Transmission Revenues

<b>Wholesale Transmission Revenue in Delivery Rates</b>		
Test Year	\$	53,426
<b>Historical Wholesale Transmission Revenue</b>		
2014		56,779
2015		56,868
2016		47,594
2017		44,516
2018		40,071
<b>5 Year Average</b>	\$	49,165
<b>Rate Year Change</b>	\$	(4,261)

- 13
- 14 j) Damage and Third Party Payments – \$12,196,000 decrease to reflect the removal  
15 of Puerto Rico mutual aid reimbursements from the Rate Year (\$12,315,000),  
16 offset somewhat by the application of the general inflation factor to all other  
17 reimbursements to match the forecasts of the corresponding costs. See Table 2  
18 for details of the Test Year Revenues and the Rate Year Forecast.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

Table 2: Damage and Third Party Payments

<u>G/L</u>	<u>Revenue Account</u>	<u>2018 Test Year</u>	<u>General Inflator</u>	<u>Rate Year</u>	<u>RY Change</u>
759000160	Installation Modification Income	\$ 2,574	4.89%	\$ 2,699	\$ 125
759000165	Installation Modification Income (Taxable)	1,185	4.89%	1,243	58
759000140	Third Party Damages	285	4.89%	299	14
759000190	Other Services to Third Parties	2,243	4.89%	2,352	109
759000190	Perry Fire Restoration Expense (One Time)	225	n/a	-	(225)
759000240	Studies & Engineering for Third Parties	125	4.89%	132	7
759000220	Maintenance Work for Third Parties	630	4.89%	660	30
759000220	Mutual Aid Puerto Rico (One Time)	12,315	n/a	-	(12,315)
		<u>\$ 19,581</u>		<u>\$ 7,385</u>	<u>\$ (12,196)</u>

k) Joint Use Property Sales – \$6,198,000 decrease reflecting the of the sale of interests in certain poles (\$3,811,000) and the one-time payment of \$2,500,000 in the Test Year for prior year billings, offset somewhat by an increase to pole counts. See Table 3 for details of Test Year Revenues and the Rate Year Forecast.

Table 3: Joint Use Property Sales

Pole Rental Revenue - Test Year	\$ 10,650
Test Year normalization adjustment:	
Prior Year billing	(2,500)
Normalized revenue - Test Year	\$ 8,150
Revenue Impact of sale of pole interests	(3,811)
Forecasted revenue impact of higher pole counts	113
<b>Pole Rental Revenue - Rate Year</b>	<b>\$ 4,452</b>
Change - Rate Year vs. Test Year	\$ (6,198)

**V. ELECTRIC RDM**

Q. Please describe NYSEG's current electric RDM.

A. NYSEG's current electric RDM structure is outlined in Appendix U of the Joint Proposal approved in the Companies' 2010 Rate Order, as modified in Appendix Y of the Joint Proposal approved in the 2016 Rate Order. It consists of 11 separate RDM classes for reconciliation purposes.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. Is the Panel proposing any changes to NYSEG’s electric RDM?

2 A. No.

3 Q. Did the Panel determine the proposed new RDM targets?

4 A. Yes, the new electric RDM unit and customer targets for the Rate Year are included in  
5 Exhibit \_\_ (NYSEGDRRDMP-6), page 2 of 2. The new RDM revenue targets will be  
6 established upon settlement of new rates.

7 **VI. NATURAL GAS DELIVERIES AND CUSTOMERS FORECAST**

8 **A. Natural Gas Deliveries Forecast**

9 Q. How did the Panel forecast monthly natural gas billed deliveries?

10 A. Like the electric billed forecast, we also used an econometric modeling methodology to  
11 estimate the relationship between certain explanatory, or independent, variables and the  
12 dependent variable, which, in this case, is monthly billed natural gas deliveries by  
13 customer class. We also utilized econometric modeling to forecast the number of  
14 residential customers.

15 Q. Did the Panel estimate the economic relationships between natural gas usage and the  
16 explanatory variables using the same computer software used to develop the electric  
17 forecasting models?

18 A. Yes. We utilized the same MetrixND computer software.

19 Q. Did the Panel use the same source for demographic and economic variable data that was  
20 used to develop the electric forecasting models?

21 A. Yes. The demographic and economic variable forecasts are from Moody’s Analytics  
22 released in January 2019.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. Did the Panel use the same categories of variables that were used to forecast monthly  
2 electric deliveries, as discussed above?

3 A. Yes, with two differences.

4 Q. What is the first difference?

5 A. For the residential class, we used a residential use per customer model. The forecasted  
6 number of residential customers is multiplied by the forecasted residential average use  
7 per customer to determine the forecasted monthly residential billed deliveries forecast. A  
8 demographic variable was not used in the use per customer model. A demographic  
9 variable was used in the model to forecast the number of residential customers.

10 Q. What is the second difference?

11 A. For the natural gas deliveries forecast, we used an empirical method of weather  
12 normalization. We employed this methodology to better analyze the historical data and  
13 calculate true growth rates. Using this method, the historical data is weather-normalized  
14 and subsequently brought into the model. For this reason, it is not necessary to include a  
15 weather variable in the model, and it allows consistency of application for each customer  
16 class. This methodology is consistent with prior rate case forecasts.

17 Q. Please describe the natural gas weather normalization methodology.

18 A. We used billing month weather for the residential, commercial, municipal, and industrial  
19 classes. The first step is to take the actual deliveries for each year and subtract the base  
20 load deliveries. The term “base load” is defined as the average of the non-weather-  
21 related deliveries during the two months having the lowest level of gas consumption  
22 observed during the calendar year. The second step is to divide the remaining (weather-

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 related) deliveries load by the actual billing month heating degree days (“HDDs”). This  
2 yields the actual weather response per HDD for the billing month. The third step was to  
3 multiply the quotient by the normal billing month HDDs. The term “normal degree  
4 days” in this context is defined as the 30-year rolling average (1989-2018) of degree days  
5 for any given calendar day as obtained from the National Oceanic and Atmospheric  
6 Administration. The last step is to add the base load that was originally removed.

7 Q. How much historical data was used in the models?

8 A. Monthly historical data from January 1993 through December 2018 was used for the  
9 residential econometric model. Monthly historical data from January 2000 through  
10 December 2018 was used for the non-residential econometric models. This data sample  
11 allows for efficient estimates of econometric model coefficients.

12 Q. Please explain the residential sales forecasting model.

13 A. The residential model relates weather normalized use per customer to price and a generic  
14 trend variable. Total residential deliveries are determined by multiplying the average use  
15 per customer by the estimated number of residential customers to determine the monthly  
16 residential billed deliveries forecast for the Rate Year.

17 Q. Why was an average use per customer model used instead of a billed deliveries model to  
18 estimate residential sales?

19 A. Within the natural gas industry, it is a generally accepted methodology to use average use  
20 per customer to estimate residential sales.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. What specific explanatory variables did the Panel employ in the average use per customer  
2 econometric model?

3 A. We used the following variables: real residential price; monthly binary variables; the  
4 number of billing days in the month; and a generic trend variable. In our experience, we  
5 have found that these variables can explain and estimate natural gas use per residential  
6 customer.

7 Q. What is the expected growth rate for the residential class?

8 A. The average annualized growth rate for the residential class between the Test Year,  
9 weather-normalized, and the Rate Year is -0.82%.

10 Q. How were the commercial, industrial, and municipal sales forecasts developed?

11 A. We used econometric modeling that relates monthly weather-normalized deliveries to  
12 economic and price related drivers.

13 Q. Please identify the explanatory variables that the Panel used to develop commercial,  
14 industrial, and municipal sales forecast.

15 A. The database for the weather-normalized total commercial class consisted of the  
16 following variables: real commercial price; upstate New York non-manufacturing  
17 employment; the number of billing days in the month; and monthly binary variables. The  
18 database for the weather-normalized industrial class consisted of the following variables:  
19 real industrial price; upstate New York employment manufacturing; and monthly binary  
20 variables. The database for the weather-normalized total municipal class consisted of the  
21 following variables: real municipal price; the number of NYSEG residential customers; a

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 generic trend variable; the number of billing days in the month; and monthly binary  
2 variables.

3 Q. Why did the Panel use these categories of explanatory variables?

4 A. In our experience, we have found that these variables can best explain and estimate  
5 commercial, industrial, and municipal natural gas sales forecasts.

6 Q. Why did the Panel use the number of residential customers for the municipal class?

7 A. The basis of the assumption is that a municipal customer, which includes town/village  
8 offices and schools, will grow or decline based on the population it serves. Its  
9 constituency is comprised, for the most part, of NYSEG's residential customers.

10 Q. What are the average annualized growth rates for the commercial, industrial, and  
11 municipal classes?

12 A. The average annualized growth rates between the Test Year and the Rate Year are 0.19%  
13 for the commercial class, 1.26% for the industrial class, and -0.26% for the municipal  
14 class. In total, the non-residential classes increased by 0.51%.

15 Q. What are the results of the total natural gas deliveries forecast?

16 A. Based on the forecasts that we have described, NYSEG expects that the overall natural  
17 gas deliveries volume will decrease by an average annualized percentage of 0.03% from  
18 the Test Year, weather-normalized deliveries, compared to the Rate Year. The natural  
19 gas deliveries forecast is shown in Exhibit \_\_ (NYSEGDRRDMP-7), Schedule A.  
20 Historical weather-normalized deliveries from January 1, 2016 through December 31,  
21 2018 and forecasted deliveries from January 1, 2019 through March 31, 2021 are  
22 presented in this exhibit.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. Did the Panel make any out of model adjustments to the natural gas deliveries forecasts?

2 A. Yes. An out of model adjustment is made to econometric forecasts to account for factors  
3 that have an effect on projected sales that cannot be accounted for within the econometric  
4 model itself. One out of model adjustment was made to account for the targets related to  
5 NYSEG's ETIP. Because the expected decrease in load due to NYSEG's incremental  
6 ETIP impact is not reflected in the historical data used in our econometric models, it was  
7 necessary to make out of model adjustments to the forecasted residential, commercial,  
8 industrial, and municipal load.

9 Q. Would the Panel please identify the adjustments for ETIP?

10 A. The Company based the total out of model adjustments for ETIP in years 2019 and 2020  
11 on the SEEP. The SEEP identified annual Dth reduction targets of 116,003 for 2019 and  
12 132,141 for 2020. For years beyond 2020, we obtained estimates from the  
13 NYSEG/RG&E Energy Efficiency group. A summary of the annual out of model  
14 adjustments by revenue class for years 2019 to 2021 can be found in Exhibit \_\_  
15 (NYSEGDRRDMP-7), Schedule B. NYSEG then allocated the annual targets on a  
16 monthly basis according to each revenue classes' monthly load shape. The average  
17 annualized growth rate between the Test Year and the Rate Year was -0.3% for the  
18 residential class and 0.59% for the total non-residential classes, prior to the ETIPs  
19 adjustment. The average total annualized growth rate between the Test Year and the Rate  
20 Year for total NYSEG gas deliveries prior to ETIPs adjustments was 0.23%.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

**B. Natural Gas Customer Forecast**

1  
2 Q. How did the Panel develop the natural gas customer forecast for the residential customer  
3 class?

4 A. The number of residential customers is forecasted with an econometric model that uses  
5 Moody's Analytics' forecast of the number of households in upstate New York as the  
6 main explanatory demographic variable, and monthly binary variables.

7 Q. Why is econometric modeling appropriate for the residential customer class?

8 A. In the case of residential customers, the number of residential customers is highly  
9 correlated, and dependent upon, the number of households in Upstate New York. This  
10 causal relationship can be accurately estimated using econometric modeling. It follows  
11 then that an accurate forecast of Upstate New York households, as provided by Moody's  
12 Analytics, would yield an accurate forecast of residential customers.

13 Q. What is the growth of residential customers over the forecast period compared to the Test  
14 Year?

15 A. The average annualized growth rate for the Test Year compared to the Rate Year  
16 is 0.22%.

17 Q. How did the Panel develop the natural gas customer forecast for commercial, industrial,  
18 and municipal classes?

19 A. We developed the natural gas customer forecast for these classes by applying the  
20 historical customer data to an exponential smoothing model. An exponential smoothing  
21 model is a univariate, or one variable, forecasting method that is widely used in business  
22 forecasting.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. What are the growth rates of the commercial, industrial, and municipal classes over the  
2 forecast period compared to the Test Year?

3 A. For the commercial class, the average annualized growth rate for the Test Year compared  
4 to the Rate Year is 0.19%. For the industrial class, the growth rate for the Rate Year  
5 compared to the Test Year is -3.48%. For the municipal class, the average rate for the  
6 Test Year compared to the Rate Year is 0.38%. For the non-residential classes, the total  
7 average annualized growth rate for the Test Year compared to the Rate Year is 0.14%.

8 Q. How many natural gas customers do the Companies forecast for the Rate Year?

9 A. The natural gas customer forecast is illustrated in Exhibit \_\_ (NYSEGDRRDMP-7),  
10 Schedule C. The historical actual number of customers from January 1, 2016 through  
11 December 31, 2018 and the forecasted number of customers from January 1, 2019  
12 through March 31, 2021 are presented in this exhibit.

13 **C. Allocation of Forecasts Among Sales and Transportation Service Classes**

14 Q. How did the Panel allocate its forecast of residential, commercial, industrial and  
15 municipal deliveries and customers to the sales and transportation service classes?

16 A. We allocated the forecasts to the sales and transportation service classes using historical  
17 monthly distributions and trends.

18 **D. Model Validation**

19 Q. Did the Panel validate the models used to develop the forecasts of monthly natural gas  
20 deliveries?

21 A. Yes. As with our models used to develop the forecasts of monthly electric deliveries and  
22 customers, we validated our natural gas models using the same “Goodness of Fit” tests

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 and MAPE statistics. Ex Post tests were performed where the MAPE statistic is also re-  
2 used to demonstrate how well the models forecast two years out.

3 Q. What are the results of the validation tests?

4 A. The results and model specifications are shown in Exhibit \_\_ (NYSEGDRRDMP-8),  
5 Schedule A. They establish that the models used for natural gas forecasting have very  
6 strong summary statistics and generalize well.

7 **VII. GAS DELIVERY REVENUES**

8 Q. Please provide a brief description of the NYSEG gas service classes.

9 A. NYSEG has customers taking service under the following SCs:

10 PSC No. 87 Service Classifications:

11 SC-1S Residential Service  
12 SC-2S General Service  
13 SC-3S Interruptible Sales Service  
14 SC-5S Seasonal Gas Cooling Service  
15 SC-9S Industrial Manufacturing or Processing Purposes (Binghamton  
16 Only)

17  
18 PSC No. 88 Service Classifications:

19 SC-1T Firm Transportation Service  
20 SC-2T Interruptible Transportation Service  
21 SC-5T Small Firm Transportation Service  
22 SC-7T Firm or Limited Firm Negotiated Transportation Service  
23 SC-13T Residential Firm Aggregation Transportation Service  
24 SC-14T Non-Residential Firm Aggregation Transportation Service  
25 SC-16T Non-Residential Distributed Generation Transportation

26 Q. Please describe how the Billed Gas Delivery Revenues are calculated in Exhibit \_\_  
27 (NYSEGDRRDMP-9).

28 A. A five-step process is used to calculate the forecasted monthly Billed Gas Delivery  
29 Revenues, as set forth in Exhibit \_\_ (NYSEGDRRDMP-9).

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. What is the first step?

2 A. The first step of the gas delivery revenue forecast is to incorporate the forecasted  
3 deliveries and customers for SC-1S, SC-2S, SC-5S, SC-9S, SC-1T, SC-5T, SC-13T, SC-  
4 14T and SC-16T into the Gas Revenue Model. The monthly forecasted delivery volumes  
5 are allocated to the gas rate blocks established in NYSEG's gas tariff based on  
6 distributions derived from block analyses covering June 2016 to October 2018. The  
7 individual month used for the block analysis was based on the month in the three-year  
8 period where the actual billing month HDD was closest to normal HDD. The forecasted  
9 deliveries by block are then multiplied by the current tariff rates, effective as of October  
10 1, 2018, for the respective SCs, and the customer counts are multiplied by the fixed  
11 monthly customer charge for the respective SCs to derive forecasted base delivery  
12 revenues.

13 Q. What is the second step?

14 A. The forecasted sales for SC-3S, SC-2T, and SC-7T are multiplied by either average  
15 contract rates or average historical deliveries rates by rate area.

16 Q. What is the third step?

17 A. The calculated distribution revenues by SC are then allocated to Revenue Class based on  
18 the deliveries forecast data.

19 Q. What is the fourth step?

20 A. The forecasted deliveries, where applicable, are multiplied by the forecasted tariff rates to  
21 derive the forecasted revenue from the MFC/POR, CEF – NYSERDA Surcharge, and the

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 R&D Surcharge. The costs previously recovered through the former Energy Efficiency  
2 Surcharge will now be recovered through base rates.

3 Q. What is the fifth step in developing the Billed Gas Delivery Revenue forecast?

4 A. The fifth and final step is to apply the gross revenue tax rates to the delivery revenues  
5 using the actual revenue tax rates for service type (i.e., sales vs. transportation), and  
6 customer type (i.e., residential vs. non-residential).

7 Q. Please describe Exhibit \_\_ (NYSEGDRRDMP- 9).

8 A. Exhibit \_\_ (NYSEGDRRDMP-9), pages 1 through 4 of 9 show actual monthly delivery  
9 revenues for 2016 and 2017, respectively. Pages 5 and 6 of 9 show actual monthly  
10 delivery revenue for the Test Year. Pages 7 and 8 of 9 show forecasted monthly delivery  
11 for the Rate Year. Page 9 of 9 shows a summary of the Test Year and the Rate Year.

12 Q. What does the line item labeled Gross Base Delivery Charges represent in Exhibit \_\_  
13 (NYSEGDRRDMP-9)?

14 A. The line item labeled Gross Base Delivery Charges represents fixed monthly customer  
15 charges and the volumetric block deliveries charges. The rates used to calculate such  
16 charges incorporate the impact, effective October 1, 2018, of certain tax rate benefits  
17 associated with the Tax Cuts and Jobs Act of 2017, pursuant to the Tax Order.

18 Q. What do the line items labeled Economic Development Discounts represent in Exhibit \_\_  
19 (NYSEGDRRDMP-9)?

20 A. The line items labeled Economic Development Discounts represent forecasted rate  
21 discounts for these programs, as discussed in the testimony of the Economic  
22 Development Panel.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. What does the MFC line item represent in Exhibit \_\_ (NYSEGDRRDMP-9)?

2 A. The MFC represents the revenue charged to sales customers to recover their share of  
3 credit, collection, call center, and administrative costs associated with the Company's gas  
4 merchant activities.

5 Q. Please explain the RDM Surcharge.

6 A. The RDM Surcharge represents the collection or refund of revenues that were either  
7 under-collected or over-collected in the prior RDM year.

8 Q. Is the RDM Surcharge included in the Rate Year revenues?

9 A. No. The Rate Year forecast assumes there was no over- or under-collections in the prior  
10 RDM year.

11 Q. What does the line item labeled CEF – NYSERDA Surcharge represent?

12 A. The CEF – NYSERDA Surcharge recovers from customers the Company's payments to  
13 NYSERDA for the previously authorized EEPS 2 Gas Collections.

14 Q. Please explain the previous Energy Efficiency Surcharge.

15 A. The Energy Efficiency Surcharge was a surcharge that previously represented the  
16 revenue charged to all customers to recover the costs associated with Energy Efficiency.  
17 The charge is structured so that all forecasted Rate Year Energy Efficiency costs are  
18 recovered within the Rate Year. The Energy Efficiency Surcharge will be eliminated in  
19 this proceeding as the costs recovered through the mechanism are being rolled into base  
20 rates.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. What does the line item labeled R&D Surcharge represent?

2 A. The line item labeled R&D Surcharge represents the surcharge applied to all deliveries to  
3 recover R&D expenditures of \$650,000 per year.

4 Q. What does the line item labeled GRT Surcharge represent in Exhibit \_\_\_\_  
5 (NYSEGDRRDMP-9)?

6 A. The line item labeled GRT Surcharge represents a delivery revenue surcharge that  
7 collects gross revenue taxes from customers that are subsequently remitted by the  
8 Company to New York State and various municipalities.

9 Q. What is the BIPP Charge?

10 A. The BIPP Charge is a per invoice charge to recover the cost of billing customers and  
11 processing their payment. It was unbundled from the monthly customer charge in 2007  
12 consistent with the Customer Choice Order.

13 Q. Please explain the POR Charge.

14 A. The POR Charge represents the revenue charged to ESCOs through the POR discount  
15 rate to recover the credit, collection, and call center costs associated with the Company's  
16 purchased commodity receivables.

17 Q. What are the primary items included in the line entitled Miscellaneous Revenue?

18 A. Miscellaneous Revenue consists primarily of rental income and special service fees.

19 Q. What does the line labeled Damage and Third Party Payments represent?

20 A. The line item consists primarily of reimbursements for O&M expenditures related to  
21 damage, elevated pressure fees, meter relocations, meter upgrades, and mutual aid service  
22 (test year only).

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. Does the Rate Year revenue include similar revenue as the Test Year?

2 A. Yes.

3 Q. Please explain the revenue adjustments in Exhibit \_\_ (NYSEGDRRDMP-9), page 9 of 9,  
4 between the Test Year and the forecasted Rate Year.

5 A. The total delivery revenue adjustment between the Test Year and the Rate Year is a  
6 decrease of \$5,970,000, which is attributed to the following:

7 a) A decrease of \$65,000 due to a full year of lower base tariff rates for the Rate Year  
8 resulting from the Tax Cuts and Jobs Act of 2017, as compared to three months of  
9 lower rates in the Test Year.

10 b) A reduction in Economic Development Discounts of \$20,000 to incorporate the lower  
11 proposed level of rate discounts for the Rate Year as discussed by the Revenue  
12 Allocation, Rate Design, Economic Development and Tariff Panel.

13 c) A decrease of \$19,000 due to a reduction in MFC revenues to reflect only the  
14 administrative and procurement cost recovery in the Rate Year.

15 d) A decrease in RDM Charges of \$368,000 to eliminate the Test Year refund of prior  
16 year net over-collections. The Rate Year forecast assumes no over or under-  
17 collections in the preceding RDM year.

18 e) A decrease of \$3,051,000 to incorporate the required level of collections in the  
19 CEF Order.

20 f) A decrease of \$884,000 to reflect the level of collections associated with the energy  
21 efficiency programs implemented by the Company, EE Tracker (Energy Efficiency

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Surcharge). A separate Energy Efficiency Surcharge will be eliminated in this  
2 proceeding as these costs will be included in base rates.

- 3 g) A decrease of \$65,000 to recover R&D expenditures of \$650,000 per year.  
4 h) A decrease of \$12,000 in GRT to incorporate revenue levels identified above.  
5 i) An increase in BIPP Charges of \$9,000 to reflect the higher customer count in the  
6 Rate Year.  
7 j) A decrease in the POR Charge of \$476,000 to present the Rate Year amount, in  
8 combination with MFC Revenue, as the amount allowed in 2016 Rate Order.  
9 k) A decrease in Late Payment Charges of \$189,000 reflecting a forecasting process in  
10 which forecasted delivery revenues are multiplied by the three-year historical ratio of  
11 late payment charges to delivery revenues.  
12 l) A decrease in Miscellaneous Revenue of \$556,000 to reflect the use of a three-year  
13 normalized historical average to forecast the miscellaneous items where a specific  
14 forecast was not obtained.  
15 m) An increase in Damage and Third Party Payments of \$25,000 to reflect the  
16 application of the general inflation factor to all other reimbursements to match the  
17 forecasts of the corresponding costs.

18 Q. How is the Late Payment Charge Calculated for the Rate Year?

19 A. Three years of historical late payment charges are divided by billed revenues from the  
20 same time period to calculate a percentage that is applied against forecast billed revenues.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. How are Other Revenues determined for the Rate Year?

2 A. Damage and Special Fees represent a forecast provided by the respective  
3 departments. Otherwise, a normalized three-year average was used.

4 **VIII. GAS RDM**

5 Q. Please describe NYSEG's current gas RDM.

6 A. NYSEG's current gas RDM structure is outlined in Appendix U of the Joint Proposal  
7 approved in the Companies' 2010 Rate Order, as modified by the Commission's Order  
8 Modifying Gas Revenue Decoupling Mechanisms and Establishing Further Procedures,  
9 issued August 20, 2012 in Case 09-G-0718 and updated in Appendix Y of the Joint  
10 Proposal approved in the 2016 Rate Order.

11 Q. Is the Panel proposing any changes to NYSEG's gas RDM?

12 A. Yes, we are proposing two changes to NYSEG's gas RDM.

13 Q. What changes are you proposing to NYSEG's gas RDM?

14 A. We propose changing NYSEG's gas RDM from a Revenue per Customer ("RPC") RDM  
15 to a Total Revenues RDM, similar to NYSEG's electric RDM. We also propose to  
16 include the interruptible service classes (SC2T, SC3S) in the Non-Residential RDM  
17 category. We propose these changes to make the gas RDM more similar to the electric  
18 RDM methodology. Additionally, the change is consistent with the methodology that has  
19 been implemented at other New York gas utilities.

**DIRECT TESTIMONY OF NYSEG DELIVERIES AND REVENUES /  
REVENUE DECOUPLING MECHANISM PANEL**

1 Q. Does the Panel have the proposed new RDM targets?

2 A. Yes. The new RDM billed unit and customer targets for the Rate Year are included in  
3 Exhibit \_\_ (NYSEGDRRDMP-10), page 2 of 2. The new RDM revenue targets will be  
4 established upon settlement of new rates.

5 Q. Does the Panel propose to extend the Gas Enhancement Performance Incentive  
6 (“GEPI”)?

7 A. No.

8 Q. Does this complete the Panel’s testimony at this time?

9 A. Yes, it does.
