**Case 13-G-0031**  
**Case 13-S-0032**

**May 2013**

---

Prepared Direct Testimony of:

John D. Stewart

On Behalf of:

The City of New York

1 **I. INTRODUCTION**

2 **Q. PLEASE STATE YOUR NAME, OCCUPATION AND BUSINESS**  
3 **ADDRESS.**

4 A. My name is John D. Stewart. I am a Vice President employed by Concentric  
5 Energy Advisors, Inc. (“Concentric”), located at 293 Boston Post Road West,  
6 Suite 500, Marlborough, Massachusetts 01752.

7 **Q. ON WHOSE BEHALF ARE YOU SUBMITTING THIS TESTIMONY?**

8 A. I am submitting this direct testimony before the New York Public Service  
9 Commission (“PSC”) on behalf of the City of New York (“City”).

10 **Q. PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND**  
11 **PROFESSIONAL EXPERIENCE IN THE ENERGY AND UTILITY**  
12 **INDUSTRIES.**

13 A. My background information, and information about Concentric, was provided as  
14 part of the direct testimony of the New York City Policy Panel.

15 **II. PURPOSE AND OVERVIEW OF TESTIMONY**

16 **Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

17 A. My testimony addresses the potential regulatory policy and ratemaking  
18 implications of the City’s recommendations for additional infrastructure  
19 investments for the purpose of enhancing the resiliency of Consolidated Edison  
20 Company of New York, Inc.’s (“Con Edison” or the “Company”) electric, gas and

1 steam systems. I address: (a) the impacts of the City's recommendations on Con  
2 Edison's utility rates; (b) whether it is reasonable to levelize rates; (c) whether the  
3 Company's rate levelization methodology is optimal; and (d) the costs and  
4 benefits of the City's proposed investments based on a high level analysis.

5 Q. **ARE YOU RECOMMENDING THAT RATES BE INCREASED BY**  
6 **MORE THAN WHAT CON EDISON HAS REQUESTED?**

7 A. No. The purpose of my testimony is to illustrate the potential impacts of  
8 increased resiliency investments. To do that, I have estimated the incremental  
9 impact of the City's resiliency recommendations on Con Edison's base case, as  
10 filed. That does not mean, however, that the resiliency investments will yield rate  
11 increases in excess of what Con Edison has requested. To the contrary, I expect  
12 that there will be other revenue and expense adjustments in this case that will  
13 more than offset the impact of the City recommendations.

14 In addition, my analyses are done primarily for illustrative purposes and  
15 are based on conservative assumptions. For example, I have assumed that the  
16 incremental resiliency investment resulting from the City's recommendations  
17 would not be offset by other changes in Con Edison's capital program. In any  
18 event, the PSC must balance the benefits of the increased resiliency investments,  
19 which the City believes are demonstrable, against the rate impacts on customers  
20 when all revenues and costs are accounted for.

1 Q. PLEASE PROVIDE AN OVERVIEW OF YOUR ANALYSIS AND  
2 SUMMARIZE YOUR CONCLUSIONS IN THIS PROCEEDING.

3 A. The New York City Electric Infrastructure Panel (“Electric Panel”) proposes  
4 various modifications to Con Edison’s capital spending plans during the next  
5 three years or more which could increase the Company’s overall capital spending  
6 for its electric system. Similarly, the New York City Gas and Steam  
7 Infrastructure Panel (“Gas and Steam Panel”) makes a number of  
8 recommendations related to the Company’s gas and steam operations which  
9 similarly could increase the Company’s capital spending for the gas and steam  
10 systems.

11 The Electric Panel does not precisely quantify its recommendations; the  
12 Gas and Steam Panel is able to quantify the value of one of its recommendations,  
13 related to an accelerated gas main replacement program, which is described in  
14 more detail in that Panel’s testimony. The incremental capital expenditure  
15 associated with this program, which is expected to continue for about 20 years, is  
16 about \$60 million and will likely increase by inflation over time. Because the two  
17 City Panels do not precisely quantify the impact of their other recommendations  
18 on the Company’s overall capital spending during the next three years, I have  
19 conservatively assumed, after consulting with each Panel, that their  
20 recommendations could increase annual capital spending for electric, gas, and

Cases: 13-E-0030  
13-G-0031  
13-S-0032

John D. Stewart

1 steam by approximately 6 percent, 15 percent, and 10 percent, respectively, with  
2 the gas increase being inclusive of the gas main replacement program. I make  
3 these assumptions only to illustrate how the impact of these potential capital  
4 spending increases might impact rates.

5 Exhibit \_\_ [JDS-1] illustrates the effect of my conservative assumptions  
6 on the Company's overall capital expenditure levels for its electric, and steam  
7 operations. Again, I note that the approach I have employed with the 6 to 15  
8 percent placeholders conservatively assumes that all incremental capital  
9 expenditures will not displace expenditures already in the Company's overall  
10 construction plan. This Exhibit also shows the impact of the additional  
11 expenditures recommended for gas operations discussed above.

12 I computed the incremental annual revenue requirements associated with  
13 the revised expenditure levels based on assumptions generally consistent with the  
14 Company's ratemaking treatment of similar investments. Overall, I conclude that,  
15 even assuming no displacement of otherwise scheduled capital expenditures, the  
16 impact of the City's recommendations for additional resiliency-related capital  
17 expenditures is modest and, based on typical rate case outcomes, likely would be  
18 fully offset by offsetting rate adjustments. Moreover, in considering the City's  
19 proposed spending increases, it is important to consider the relative costs of  
20 investing in utility plants today to provide greater resiliency versus the potential

1 costs to society if such investments are not made. My analysis shows that the cost  
2 to Con Edison's ratepayers associated with greater resiliency is very small when  
3 compared to the potential costs if such investments are not made.

4 On the issue of how Con Edison's revenue requirement is levelized, I  
5 conclude that rather than levelizing the dollar amount of the rate increase each  
6 year, it is more reasonable to levelize the percentage increase in unit costs of  
7 delivery service each year. In my testimony below, I show the new price paths  
8 based on this approach before and after adjusting the Company's revenue  
9 requirement for the higher level of capital expenditures.

10 **Q. HOW SHOULD THE ACTUAL AMOUNT OF CAPITAL**  
11 **EXPENDITURES FOR THE COMPANY FOR THE NEXT FEW YEARS**  
12 **BE DEVELOPED?**

13 A. The interested parties could convene during this rate proceeding to mutually  
14 consider the City's conclusions and recommendations, use the City's model and  
15 proposed approach to identify and prioritize the resiliency projects to be  
16 undertaken during the rate year and thereafter, and develop an implementation  
17 schedule which generally limits rate impacts to levels that are deemed acceptable.  
18 Of course, the PSC has the ultimate approval on any plan.

19 **Q. HOW IS THE REMAINDER OF YOUR TESTIMONY ORGANIZED?**

20 A. The remainder of my testimony addresses the major lines of inquiry noted above

1 and provides the details for the calculations relied upon to estimate a number of  
2 the longer range incremental rate impacts of the City's recommendations. It is  
3 organized into five additional sections, as follows:

4 III. The City's Capital Expenditure Recommendations

5 IV. Rate Levelization

6 V. Rate Impacts and Rate Mitigation: City Recommendations

7 VI. Overall Costs and Benefits

8 VII. Calculation of Rate Impacts

9 **III. THE CITY'S CAPITAL EXPENDITURE RECOMMENDATIONS**

10 **Q. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?**

11 A. This section of my testimony illustrates the potential impacts of additional capital  
12 expenditures by Con Edison related to making its electric, gas, and steam systems  
13 more resilient.

14 **Q. PLEASE SUMMARIZE THE CITY'S OVERALL RECOMMENDATION**  
15 **FOR RESILIENCY-RELATED INVESTMENTS.**

16 A. The City's Electric Panel and the Gas and Steam Panel have made a number of  
17 recommendations which could increase the Company's capital spending over the  
18 next three years or longer. As noted earlier, I have conservatively assumed for  
19 illustrative purposes that these recommendations will increase capital spending  
20 for each business during the next three years by about 6 to 15 percent per year.

Cases: 13-E-0030  
13-G-0031  
13-S-0032

John D. Stewart

1 Consistent with the recommendations of the Electric Panel and Gas and Steam  
2 Panel, I expect that a process will be established in these proceedings to better  
3 define the components and cost associated with the City's recommendations.

4 **Q. PLEASE PROVIDE AN ILLUSTRATION OF THE POTENTIAL TOTAL**  
5 **COST OF THE PROPOSED ELECTRIC CAPITAL EXPENDITURES.**

6 A. Although the Company and City are testifying to a one-year rate case, I present  
7 information throughout my testimony for a three-year period to provide a better  
8 perspective of the costs. City Table JDS-1 provides the Company's proposed  
9 electric capital expenditures and the potential impact of the City's  
10 recommendations concerning improved electric system resiliency, which for  
11 illustrative purposes I assumed would increase the Company's overall capital  
12 spending by a conservative 6 percent per year.

JDS-1: Electric Additions: Con Edison Adjusted by NYC			
	RY 1	RY 2	RY 3
Con Edison Proposed Capital Additions	2014	2015	2016
Electric Steam Production Asset Class	37	30	32
Electric Transmission And Distribution	1,195	1,227	1,197
Storm Hardening	154	321	201
Common Allocated to Electric	208	183	192
Total Proposed by Con Edison	1594	1761	1622
NYC Proposed Incremental Capital Additions	2014	2015	2016
Total Proposed by NYC	96	106	97
GRAND TOTAL	1,690	1,867	1,719

13  
14 Thus, for illustrative purposes, I have estimated that the Company may spend a  
15 total of approximately \$300 million more on electric capital expenditures related

1 to system resilience during the next three years.

2 **Q. PLEASE PROVIDE AN ILLUSTRATION OF THE POTENTIAL TOTAL**  
3 **COST OF THE GAS CAPITAL EXPENDITURES OVER THE TERM OF**  
4 **THE NEXT THREE YEARS.**

5 A. Table JDS-2 provides the Company's proposed gas capital expenditures, as well  
6 as the conservative 15 percent illustrative, incremental increase in capital  
7 spending for resiliency, as I described earlier.

<b>JDS-2: Gas Additions: Con Edison Adjusted by NYC</b>			
	<b>RY 1</b>	<b>RY 2</b>	<b>RY 3</b>
<b>Con Edison Proposed Capital Additions</b>	<b>2014</b>	<b>2015</b>	<b>2016</b>
Electric Steam Production Asset Class	1	0	0
Electric Transmission And Distribution	477	492	512
Storm Hardening	5	36	57
Common Allocated to Electric	46	55	56
<b>Total Proposed by Con Edison</b>	<b>529</b>	<b>583</b>	<b>625</b>
<b>NYC Proposed Incremental Capital Additions</b>	<b>2014</b>	<b>2015</b>	<b>2016</b>
<b>Total Proposed by NYC</b>	<b>79</b>	<b>87</b>	<b>94</b>
<b>GRAND TOTAL</b>	<b>608</b>	<b>670</b>	<b>719</b>

8

9 Thus, for illustrative purposes, I have estimated that the Company may spend a  
10 total of approximately \$260 million more on gas capital expenditures related to  
11 system resilience during the next three years.

12 **Q. PLEASE PROVIDE AN ILLUSTRATION OF THE POTENTIAL TOTAL**  
13 **COST OF STEAM CAPITAL EXPENDITURES OVER THE TERM OF**  
14 **THE NEXT THREE YEARS.**

Cases: 13-E-0030  
13-G-0031  
13-S-0032

John D. Stewart

1 A. Table JDS-3 provides the Company's proposed steam capital expenditures and  
2 reflects the conservative 10 percent illustrative, incremental increase in capital  
3 spending for resiliency, as I described earlier.

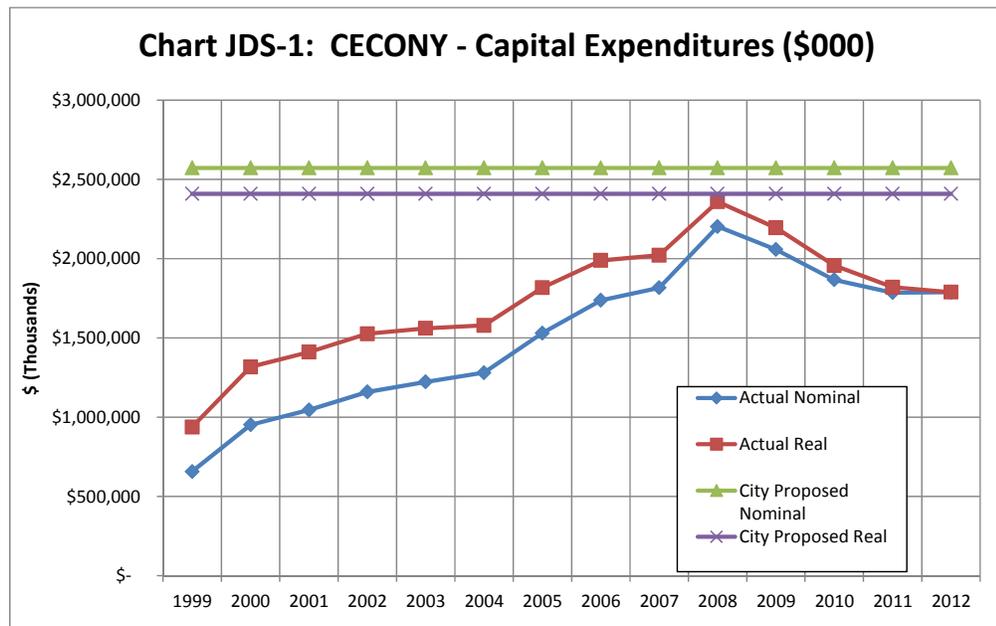

JDS-3: Steam Additions: Con Edison Adjusted by NYC			
	RY 1	RY 2	RY 3
Con Edison Proposed Capital Additions	2014	2015	2016
ERRP	1	0	0
Production Steam	37	41	44
Storm Hardening	27	31	35
Distribution Steam	30	28	27
Total Proposed by Con Edison	95	100	106
NYC Proposed Incremental Capital Additions	2014	2015	2016
Total Proposed by NYC	9.5	10	10.6
GRAND TOTAL	104.5	110	116.6
TOTAL ALL OPERATIONS	2,402	2,647	2,555

4  
5 Thus, for illustrative purposes, I have estimated that the Company may spend a  
6 total of approximately \$30 million more on steam capital expenditures related to  
7 system resilience during the next three years.

8 **Q. WHAT IS THE SIGNIFICANCE OF THE SPENDING LEVELS**  
9 **PROPOSED BY THE CITY?**

10 A. Con Edison proposed capital expenditures over the next three years totals about  
11 \$7 billion or about \$2.33 billion per year. After reflecting the City's  
12 recommendations at the assumed, illustrative levels, the total capital expenditures  
13 would be about \$7.6 billion, or about \$2.53 billion per year, all other things being  
14 equal. Chart JDS-1 shows Con Edison's capital spending for the period 2000 to

1 2012 based on cash flow statements from its annual 10-K reports and compares  
2 the results to the Company's planned capital expenditures going forward on a  
3 nominal and real (2012\$) basis, inclusive of the potential impact of the City's  
4 recommendations.

5  
6 Exhibit \_\_ [JDS-2] provides the underlying data for this chart.

7 **Q. WHAT ARE THE REGULATORY POLICY AND RATEMAKING**  
8 **IMPLICATIONS ASSOCIATED WITH THE CITY'S**  
9 **RECOMMENDATIONS?**

10 A. As a matter of regulatory policy, the PSC must determine whether it is important  
11 and worthwhile to protect Con Edison's utility systems against infrequent but  
12 very severe climatological events. There is a cost to harden Con Edison's

1 infrastructure to minimize the impact of such events on the people of New York  
2 City, and the PSC must decide whether the benefits of hardening are worth the  
3 costs. Assuming that the PSC concludes that the benefits exceed the costs, and/or  
4 identifies offsetting rate moderators, and requires Con Edison to adopt some or all  
5 of the City's recommendations, the PSC also will have to ensure that there is  
6 adequate financial support for the Company to finance the incremental external  
7 capital requirements associated with these recommendations. From a ratemaking  
8 perspective, the critical question is: do the benefits of storm hardening offset the  
9 incremental impacts of those investments on electric, gas, and steam rates? In this  
10 testimony, I provide a cost/benefit analysis that I believe leads to the conclusion  
11 that strategic storm hardening investments make sense.

12 **IV. RATE LEVELIZATION**

13 **Q. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?**

14 A. The purpose of this section of my testimony is to provide context regarding the  
15 approximate percentage rate increases produced if delivery rates are established  
16 based on Con Edison's rate case filings, and to explain the Company's  
17 methodology for levelizing the impact of delivery rate increases for its electric,  
18 gas, and steam customers over a three year period that the Company provided for  
19 context. While I support the Company's decision to levelize rates and see no  
20 errors in its calculation, if the PSC adopts a multi-year rate plan I recommend an

1 alternative methodology to levelize the rate increase percentage.

2 **Q. WHY DO YOU FOCUS ON DELIVERY REVENUES AND RATES**  
3 **RATHER THAN OVERALL ELECTRIC, GAS, OR STEAM REVENUES**  
4 **IN YOUR ANALYSIS?**

5 A. Delivery revenues are based on the costs required to deliver the commodities of  
6 electricity, gas, and steam to customers regardless of whether they are full service  
7 customers or take commodity service from another entity. Thus, delivery  
8 revenues reflect the costs associated with a utility company providing its  
9 monopoly service to its customers. In the case of steam, delivery revenues also  
10 reflect non-fuel production costs. Because utility revenues do not reflect  
11 commodity costs for customers taking commodity service from another entity, the  
12 use of overall utility revenues would provide an incomplete and inaccurate view  
13 of reality. Moreover, the PSC sets rates only for delivery service; commodity  
14 rates are based generally on market prices. It is also important to recognize that  
15 my definition of delivery revenues for electric service encompasses Con Edison  
16 residential, commercial, and industrial customers as well as customers such as the  
17 City, who are supplied energy by the New York Power Authority via Con  
18 Edison's facilities. As a result, the unit costs reflected in my analysis do not  
19 reflect the specific rates paid by any particular class of customers but rather an  
20 overall average rate. The same principle holds true for the gas and steam rate

1 projections.

2 **Q. WHAT DELIVERY RATE INCREASES ARE REFLECTED IN THE**  
3 **COMPANY'S RATE FILINGS?**

4 A. Company witness Muccilo describes the price path proposed by Con Edison. Mr.  
5 Muccilo first presents the delivery revenue requirements based on the actual costs  
6 incurred by the Company for each year, assuming a three-year rate plan for each  
7 business, and adjusts the revenues to reflect the 50 basis point stayout premium  
8 requested by Con Edison. The delivery revenue increases as well as the  
9 percentage delivery increase for each year are presented in Table JDS-4. The  
10 supporting calculations are provided in Exhibit \_\_ [JDS-3] and explained in detail  
11 in Section VII of this testimony.

	2014	2015	2016
Electric Delivery Rate Increase	\$451,700	\$194,606	\$269,996
Percentage Increase in \$/MWh	8.15%	3.23%	4.32%
Gas Delivery Increase	41,362	55,422	62,599
Percentage Increase in \$/Mdts	3.70%	4.60%	4.83%
Steam Delivery Increase	-154	22,395	18,439
Percentage Increase in \$/MMlbs	-0.03%	4.89%	3.88%

12

13 **Q. DID THE COMPANY PROPOSE ANY MODIFICATIONS TO THE RATE**  
14 **INCREASES PRESENTED IN TABLE JDS-4?**

15 A. Yes, it did. The pattern of rate increase across the various service types was very

1 uneven. For example, the electric rate increase was front-loaded in 2014 with  
2 much lower increases thereafter. In contrast, the gas and steam rate increases  
3 were back-loaded with larger increases in 2015 and 2016 than 2014. As a result,  
4 Mr. Muccilo reasonably concluded that it was desirable to develop an alternative  
5 pattern of rate increases to reflect a constant dollar rate increase in each of the  
6 three years of the Company's proposed rate plans. These levelized dollar  
7 increases along with the percentage delivery rate increase for each year are  
8 provided in Table JDS-5. The supporting calculations are provided in  
9 Exhibit \_\_ [JDS-4] and explained in detail in Section VII of this testimony.

	2014	2015	2016
Electric Delivery Rate Increase	\$336,100	\$336,100	\$336,100
Percentage Increase in \$/MWh	6.07%	5.69%	5.36%
Gas Delivery Increase	49,600	49,600	49,600
Percentage Increase in \$/Mdts	4.43%	4.09%	3.82%
Steam Delivery Increase	10,400	10,400	10,400
Percentage Increase in \$/MMlbs	2.33%	2.28%	2.25%

10

11 **Q. DO YOU HAVE ANY COMMENTS ON THE METHODOLOGY**  
12 **EMPLOYED BY MR. MUCCILO TO LEVELIZE THE DOLLAR RATE**  
13 **IMPACT AMOUNT FOR EACH YEAR OF THE COMPANY'S**  
14 **PROPOSED RATE PLANS?**

15 A. Yes. While I agree with the underlying calculations employed by Mr. Muccilo to

1 estimate the levelized dollar rate impacts, there is a better way to levelize the rate  
2 impacts associated with any multi-year rate plan that may be adopted. Mr.  
3 Muccilo's calculation levelizes the dollar value of the delivery rate increase for  
4 each year. In doing so, it does not take into consideration the impact of increasing  
5 sales over the terms of the rate plans or the fact that the base over which the rate  
6 increase is spread grows by the amount of each year's increase. As a result, the  
7 percentage rate increase on a unit cost basis, whether \$/MWh, \$/Mdts, or  
8 \$/MMlbs, is greatest in year 1 and least in year 3 due to growth in sales and the  
9 overall revenue base. The results in Table JDS-5 indicate this produces a rate  
10 increase in 2014 that is as much as 0.7 percent greater than the 2016 rate increase.

11 **Q. DO YOU RECOMMEND THAT THE LEVELIZATION APPROACH BE**  
12 **MODIFIED?**

13 A. Yes, I do. I recommend that if the PSC decides to adopt a three-year rate plan for  
14 any or all of the three businesses, the rates should be levelized in a way that  
15 produces the same percentage increase in delivery rates for each year. Thus, I  
16 would adjust Mr. Muccilo's electric, gas, and steam price paths to produce a  
17 constant percentage rate increase for each year. Table JDS-6 provides an  
18 illustration of the results of this adjustment, with supporting calculations are  
19 provided in Exhibit \_\_ [JDS-4] and explained in detail in Section VII of this  
20 testimony. The annual levelized unit cost percentage increases in delivery rates

1 over the term of the rate plan are 5.83 percent for electric, 4.20 percent for gas,  
2 and 2.24 percent for steam based on if the Company receives the full revenue  
3 requirement which it has requested.

<b>Table JDS-6: Summary of Levelized Percentage Delivery Increases</b>			
	2014	2015	2016
Electric Delivery Rate Increase	\$322,759	\$343,122	\$364,850
Percentage Increase in \$/MWh	5.83%	5.83%	5.83%
Gas Delivery Increase	47,001	50,866	54,532
Percentage Increase in \$/Mdts	4.20%	4.20%	4.20%
Steam Delivery Increase	10,255	10,485	10,621
Percentage Increase in \$/MMLbs	2.24%	2.24%	2.24%

4

5 **Q. TO BE CLEAR, IS THE CITY ADVOCATING FOR A THREE-YEAR**  
6 **RATE PLAN FOR ANY OF THE ELECTRIC, GAS, OR STEAM**  
7 **BUSINESSES?**

8 A. No. The City is not doing so, nor is it in any way advocating that Con Edison be  
9 granted full rate relief. However, the City recognizes that improving the  
10 resiliency of Con Edison's infrastructure will take years to complete, and that it  
11 should be integral to the Company's planning, design standards, and construction  
12 and operations practices. Therefore, for illustrative purposes it is useful to  
13 provide a larger perspective than simply the one-year impacts of the City's  
14 recommendations. At the same time, the City acknowledges the possibility that

1 the parties may agree upon terms for multi-year rate plans in these proceedings,  
2 and the information I present will help inform the parties' discussions.

3 **V. RATE IMPACTS AND RATE MITIGATION: CITY RECOMMENDATIONS**

4 **Q. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?**

5 A. This section of my testimony utilizes conservative assumptions to illustrate the  
6 potential rate impact of the City's resiliency-related recommendations on electric,  
7 gas, and steam delivery rates over the next three years based on the adjusted  
8 capital expenditure tables presented earlier in this testimony and summarized in  
9 Exhibit \_\_ [JDS-1]. I first identify the potential incremental rate impact of the  
10 City's recommendations. Then, for illustrative purposes only, I have layered  
11 these potential impacts on top of the Company's as-filed revenue requirements to  
12 provide the overall rate increase for each utility service. Next, I levelize the  
13 percentage rate increases for each year using the same methodology I just  
14 discussed.

15 **Q. YOU LAYER YOUR ANALYSIS ON TOP OF THE RATE INCREASES**  
16 **REFLECTED IN THE COMPANY'S RATE PLAN PROPOSALS. IS IT**  
17 **REASONABLE TO ASSUME THAT THE PSC WILL AUTHORIZE THE**  
18 **FULL INCREASE REQUESTED BY THE COMPANY FOR ELECTRIC,**  
19 **GAS, AND STEAM RATES?**

20 A. No, based on past experience, it is not realistic to assume that the PSC will

1 approve the full delivery rate increases requested by the Company. Moreover, as  
2 noted earlier, I fully expect that other adjustments to the as-filed revenue  
3 requirements in these proceedings will more than offset the impact of the  
4 increased resiliency investments. Nonetheless, I have used the Company's filings  
5 solely as a reference point to illustrate the incremental impact of the City's capital  
6 expenditure recommendations on the level of rates ultimately established by the  
7 PSC in this proceeding.

8 **Q. CAN YOU ILLUSTRATE THE POTENTIAL INCREMENTAL**  
9 **INCREASE IN CON EDISON'S DELIVERY REVENUE**  
10 **REQUIREMENTS IF THE CITY'S RECOMMENDATIONS ARE**  
11 **ADOPTED?**

12 A. Yes. The incremental annual revenue requirements and percentage delivery rate  
13 increases associated with the City's recommendations are provided in Table JDS-  
14 7. The calculations supporting the revenue requirement amounts are provided in  
15 Exhibit \_\_ [JDS-5], and explained in detail in Section VII of this testimony. The  
16 incremental annual and cumulative rate increase percentages are calculated as the  
17 differences in the rate increase percentages before and after reflecting the City's  
18 recommendations. The underlying rate increase percentage statistics are found in  
19 Exhibit \_\_ [JDS-6].

<b>Table JDS-7: Summary of Annual Incremental Rate Impacts for</b>			
	2014	2015	2016
Electric Delivery Rate Increase	\$18.3	\$20.8	\$18.7
Annual Percentage Increase in	0.33%	0.34%	0.30%
Cumulative Percentage Increase in \$/MWh	0.33%	0.68%	0.98%
Gas Delivery Increase	\$15.2	\$17.2	\$18.0
Annual Percentage Increase in	1.36%	1.41%	1.35%
Cumulative Percentage Increase in \$/Mdts	1.36%	2.79%	4.18%
Steam Delivery Increase	\$1.8	\$2.0	\$2.0
Annual Percentage Increase in	0.40%	0.43%	0.42%
Cumulative Percentage Increase in	0.40%	0.83%	1.26%

1

2 **Q. HOW DOES ADOPTION OF THE CITY’S RECOMMENDATIONS**  
 3 **IMPACT THE COMPANY’S OVERALL DELIVERY REVENUE**  
 4 **REQUIREMENTS?**

5 A. Table JDS-8 depicts the incremental impact of the City’s recommendations on  
 6 Con Edison’s revenue requirements for the next three years, once again using the  
 7 Company’s rate filing as a reference point for illustrative purposes. As I state  
 8 throughout this testimony, I do expect that the actual change in the Company’s  
 9 electric, gas, and steam rates will be less than the percentages reflected in Table  
 10 JDS-8. Supporting calculations for this Table are provided in Exhibit \_\_ [JDS-6],  
 11 and explained in detail in Section VII of this testimony.

<b>Table JDS-8: Summary of Con Ed Rate Request with Incremental Impacts</b>			
	2014	2015	2016
Electric Delivery Rate Increase	\$470.0	\$215.4	\$288.7
Percentage Increase in \$/MWh	8.48%	3.57%	4.59%
Gas Delivery Increase	\$55.0	\$72.6	\$80.6
Percentage Increase in \$/Mds	4.91%	5.96%	6.06%
Steam Delivery Increase	\$1.7	\$24.4	\$20.5
Percentage Increase in \$/MMlbs	0.36%	5.30%	4.27%

1

2 **Q. HAVE YOU COMPUTED LEVELIZED DELIVERY RATE INCREASES**  
3 **FOR CON EDISON'S ELECTRIC, GAS AND STEAM OPERATIONS**  
4 **BASED ON THE CITY'S RECOMMENDATIONS?**

5 A. Yes. Table JDS-9 below reflects levelized percentage increases in delivery rates  
6 from year to year for electric, gas, and steam operations based on the City's  
7 position and using the Company's initial position as a reference point for  
8 illustrative purposes. Supporting calculations for this Table are provided in  
9 Exhibit\_\_ [JDS-7], and explained in detail in Section VII of this testimony. The  
10 levelized percentage increases over a three-year term are 6.14 percent for electric,  
11 5.47 percent for gas, and 2.64 percent for steam.

<b>Table JDS-9: Summary of Levelized Con Ed Rate Request with Incremental Impacts</b>			
	2014	2015	2016
Electric Delivery Rate Increase	\$340.5	\$363.0	\$387.2
Percentage Increase in \$/MWh	6.14%	6.14%	6.14%
Gas Delivery Increase	\$61.2	\$67.1	\$72.8
Percentage Increase in \$/Mdts	5.47%	5.47%	5.47%
Steam Delivery Increase	\$12.1	\$12.4	\$12.6
Percentage Increase in \$/MMlbs	2.64%	2.64%	2.64%

1

2 **Q. WHAT IS THE LEVELIZED INCREMENTAL IMPACT OF THE CITY'S**  
3 **CAPITAL EXPENDITURE RECOMMENDATIONS ON UTILITY**  
4 **RATES?**

5 A. All other things being equal, a comparison of the levelized rate increases  
6 quantified in Table JDS-9 and Table JDS-6 indicates that: (i) the incremental  
7 levelized electric rate increase percentage is 0.31; (ii) the incremental levelized  
8 gas rate increase percentage is 1.27 percent; and (iii) the incremental levelized  
9 steam rate increase percentage is 0.40.

10 **Q. HOW WOULD YOU CHARACTERIZE THE INCREMENTAL**  
11 **LEVELIZED PERCENTAGE AND MONETARY DELIVERY RATE**  
12 **INCREASES ASSOCIATED WITH THE CITY'S PROPOSALS GIVEN**  
13 **YOUR ASSUMPTION THAT SUCH PROPOSALS MAY INCREASE**  
14 **CAPITAL EXPENDITURES EACH YEAR?**

15 A. The additional rate increases I discuss are the product of a conservative

1 assumption that the additional investments to improve system resiliency will on  
2 average increase Con Edison's capital expenditures by 6 to 15 percent each year.  
3 These assumptions are scalable and the revenue requirements and rate impacts  
4 can easily be adjusted for higher or lower levels of incremental adjustments. As I  
5 noted earlier, I expect that the City's recommendations will be reviewed and  
6 refined over the course of these proceedings, well before the PSC acts to set new  
7 rates. In addition, I believe that the incremental impacts shown above will be  
8 offset by other adjustments to the Company's revenue requirements. In any  
9 event, given the fact that the City's recommendations provide for the highest  
10 priority projects to be addressed first, in my view the benefits provided by  
11 strengthening the resilience of the Company's electric, gas, and steam systems,  
12 discussed below, justify the City's storm hardening recommendations. .

13 **VI. OVERALL COSTS AND BENEFITS**

14 **Q. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?**

15 A. This section of my testimony addresses the overall costs and benefits associated  
16 with the capital investments proposed by the City to improve system resiliency  
17 from a high level perspective. I provide a big picture perspective, which should  
18 not be confused with the cost-benefit analyses recommended by the Electric Panel  
19 and Gas and Steam Panels for individual capital projects. Using the conservative  
20 assumptions I set forth earlier, my analysis compares the overall costs to Con

1 Edison ratepayers associated with the City’s recommendations with the benefits to  
2 the general public of a resilient utility system with a greater ability to withstand  
3 and quickly recover from extreme events, including the costs to the public of not  
4 making such investments in a timely manner.

5 **Q. HOW ARE THE BENEFITS OF RELIABLE UTILITY SERVICE**  
6 **TYPICALLY MEASURED AND HOW DOES THIS RELATE TO THE**  
7 **BENEFITS PRODUCED BY THE CITY’S RECOMMENDATIONS?**

8 A. The benefits of reliable utility service are typically measured by the costs to  
9 society that are avoided by virtue of reliable service. In the case of the  
10 investments recommended by the City in these proceedings, the associated  
11 benefits would be the costs or economic harm that society avoids in the future by  
12 virtue of investments which are specifically intended to address more extreme  
13 conditions in the future. According to a June 2009 report by Lawrence Berkeley  
14 National Laboratory, entitled "Estimated Value of Service Reliability for Electric  
15 Utility Customers in the United States," these benefits may be quantified on the  
16 basis of both customer characteristics and outage characteristics, and it is possible  
17 to develop matrices of costs based on the classes of customers and durations of  
18 the outages.

19 **Q. WHAT HAVE YOU DONE TO ESTIMATE AVOIDED HARM FOR CON**  
20 **EDISON CUSTOMERS BASED ON AN APPROACH WHICH EMPLOYS**

1           **AVOIDED COST ESTIMATES BASED ON CUSTOMER AND OUTAGE**  
2           **CHARACTERISTICS?**

3    A.    I employed a high level analysis which focuses on the costs to Con Edison  
4           customers associated with the City’s recommendations and the total value of New  
5           York City’s Gross City Product (“GCP”). The analysis puts the rate increases  
6           associated with the City’s position within that overall context. I specifically  
7           reflect ratepayer costs in terms of lost hours and days of GCP over both a year and  
8           an extended time period. As discussed by the City’s Policy Panel, the City is  
9           developing a model which statistically assesses the probability of severe events on  
10          the Company’s electric system and develops estimates of lost GCP based on the  
11          areas most likely impacted. Because the model is still in development, I have not  
12          used it in my analysis.

13   **Q.    PLEASE EXPLAIN WHY YOU EMPLOYED A HIGH LEVEL**  
14   **APPROACH.**

15   A.    The City’s recommendations are intended to help assure that severe events in the  
16          future do not have the same or even greater impacts on the provision of utility  
17          service as Hurricane Sandy. The recommendations are made with recognition of  
18          the latest information relating to flood plains and rising ocean levels, and the  
19          recommendations reflect the concern that weather events may become more  
20          severe and more frequent in the future. Because it is the City’s position that its

1 proposed investments will decrease the potential for service outages from severe  
2 conditions, one way of assessing the cost to ratepayers is expressing that cost in  
3 terms of lost GCP. While the City's model makes that assessment on a very  
4 localized basis, my analysis considers this topic from a higher level perspective.

5 **Q. WHAT IS THE AVERAGE ANNUAL COST TO RATEPAYERS**  
6 **ASSOCIATED WITH THE CITY'S RECOMMENDATIONS IN THIS**  
7 **PROCEEDING?**

8 A. The combined electric, gas, and steam total cost by year is presented in  
9 Exhibit \_\_ [JDS-8]. This exhibit also translates these payment streams into a  
10 single levelized payment, akin to a mortgage based on the 2.1 percent discount  
11 rate employed in the rate levelization calculations I previously discussed. The  
12 levelized total cost to ratepayers of the City's recommendations for all three  
13 utility systems is about \$188 million per year for the next 43 years. A comparison  
14 of this annual cost and its potential benefits to a measure of the City's economic  
15 activity such as the GCP provides important context to this overall inquiry.

16 **Q. WHAT IS THE NEW YORK CITY GCP?**

17 A. The New York City GCP measures the value of all goods and services produced  
18 in New York City over a specified time period. Whereas the Gross Domestic  
19 Product ("GDP") measures the value of goods and services produced within a  
20 country, the GCP measures this value for a specific city. The New York City

1 Office of Management and Budget estimates the GCP on a real and nominal basis.  
2 Estimates of GCP are available for the period 1995 to 2010 and are presented in  
3 Exhibit \_\_ [JDS-9]. In 2010, the nominal GCP was \$643 billion.

4 **Q. HOW DID YOU FORECAST THE NEW YORK CITY GCP FOR THE**  
5 **FUTURE?**

6 A. I developed a forecast of the future GCP through the escalation of the nominal  
7 2010 New York City GCP by a long-term growth rate based on an average real  
8 GCP growth rate of 2.77 percent from 1995 through 2010, adjusted to reflect an  
9 expected long-term inflation rate of 2.16 percent. The 2.16 percent rate of  
10 inflation is based on three measures, the first two of which are from Bloomberg  
11 Professional and the third is from the Macroeconomic Indicators set forth in the  
12 Energy Information Administration's ("EIA"), 2012 Annual Energy Outlook,  
13 Table A20: (1) the 2.55 percent rate of long-term inflation implied by the yield  
14 spread between 30-year Treasury Bonds and 30-year Treasury Inflation Protected  
15 Securities ("TIPS") over 30 trading days ending on March 28, 2013; (2) the  
16 compound annual growth rate in CPI of 2.12 percent as projected by the EIA for  
17 2022-35; and (3) the GDP price index for 2023-2035 of 1.81 percent, also  
18 projected by the EIA. I then employed an overall future growth rate of 5.00  
19 percent to project the New York City GCP into the future. The results of this  
20 analysis are provided in Exhibit\_\_ [JDS-10]. Thus, my long-term growth rate

1 considers the historical long-term growth in GCP related to analyst, investor, and  
2 government projections of future economic conditions, as measured through the  
3 growth rate in the CPI and the GDP price index and investor expectations as  
4 measured through TIPS spreads.

5 **Q. PLEASE DESCRIBE THE RESULTS OF THE GCP FORECAST.**

6 A. I forecast the New York City GCP for 43 years into the future, which is a period  
7 that is based on an approximate average depreciation life of the investments  
8 recommended by the City over the next three years. Table JDS-10 below, among  
9 other things, summarizes the value of the GCP at various points in time over the  
10 forecast period. Exhibit \_\_ [JDS-10] also shows that on a levelized basis the  
11 annual New York City GCP over the next 43 years is about \$2.2 trillion or about  
12 \$251 million per hour.

	Annual	Daily	Hourly	Per Minute
2010	\$643,200	\$1,762.2	\$73.4	\$1.2
2014	\$781,692	\$2,141.6	\$89.2	\$1.5
2020	\$1,047,298	\$2,869.3	\$119.6	\$2.0
2030	\$1,705,276	\$4,672.0	\$194.7	\$3.2
2040	\$2,776,637	\$7,607.2	\$317.0	\$5.3
2050	\$4,521,094	\$12,386.6	\$516.1	\$8.6

13  
14 **Q. WHAT IS THE SIGNIFICANCE OF THE FORECAST GCP RESULTS?**

15 A. The GCP results indicate that the New York City economy is massive and will  
16 grow over time. However, a very significant implication of the 2010 and 2050

1 hourly information is that, for example, the illustrative incremental investment of  
2 \$600 million for resilience-related projects that I utilized in this testimony  
3 represents between roughly 8.2 hours (600/73.4) and 1.2 hours (600/516.1) of  
4 GCP over the next 43 years. Put another way, the total capital outlay represents  
5 about 2.4 hours of levelized New York City GCP over the 43 year period. This  
6 information indicates that unless one believes that the City's proposed  
7 investments will **not** prevent on average about 2.4 hours of total system outages,  
8 or the equivalent loss of GCP, over the next 43 years, the investments should be  
9 pursued. Given the known and forecasted information regarding flood plains and  
10 ocean levels, and incorporating the economic damage associated with system  
11 outages, in my view the increased investments recommended by the City for  
12 improving system reliance and avoiding the loss of GCP in the future constitute a  
13 reasonable course of action.

14 **Q. HAVE YOU PERFORMED ANY ANALYSIS FOCUSING ON DIRECT**  
15 **RATEPAYER COSTS?**

16 A. Yes, as noted above, the levelized annual New York City GCP over the next 43  
17 years is about \$2.2 trillion. Exhibit \_\_ [JDS-8] shows that the annual levelized  
18 cost to ratepayers of the City's recommendations over the same period is about  
19 \$188 million per year. This amount represents 0.0084 percent of the levelized  
20 GCP cost and is the equivalent of about 46 minutes per year of New York City

1 GCP. Thus, this information indicates that unless one believes that the City's  
2 proposed investments will **not** prevent on average about 46 minutes of total  
3 system outages, or the equivalent loss of GCP, each year over the next 43 years,  
4 the investments should be pursued. This provides an alternative way of viewing  
5 the costs and potential benefits that again, in my view, supports the City's  
6 proposal to make additional investments to improve system resilience.

7 **Q. DOES YOUR ANALYSIS CONSIDER ALL THE POTENTIAL COSTS**  
8 **ASSOCIATED WITH A PROLONGED OUTAGE?**

9 A. No. My analysis considers only lost New York City GCP as the result of an  
10 outage. There are other costs which are not considered in my analysis. These  
11 costs include, but are not limited to, out-of-pocket expenses by businesses to  
12 restart operations, repair damaged equipment, relocate functions, replace  
13 inventory, and obtain backup service. Businesses also face costs that are difficult  
14 to quantify, such as costs associated with lost opportunities and idle employees.  
15 For residential customers, my analysis does not include food and medical supply  
16 spoilage and the cost associated with any backup service. There are additional  
17 unquantifiable costs for residential customers as well, including lost opportunities,  
18 discomfort due to weather conditions, and general lifestyle inconvenience.

19 **Q. WHAT ARE THE IMPLICATIONS OF THESE ADDITIONAL COSTS**  
20 **WHICH YOU IDENTIFIED?**

1 A. These additional unquantifiable cost considerations provide another reason for  
2 supporting the City's recommendations.

3 **Q. PLEASE SUMMARIZE YOUR CONCLUSIONS REGARDING THE**  
4 **LONGER TERM COSTS AND POTENTIAL BENEFITS ASSOCIATED**  
5 **WITH THE CITY'S RECOMMENDATIONS IN THIS PROCEEDING.**

6 A. The costs associated with not making the proposed investments and potentially  
7 subjecting the City to a greater probability of an outage due to risks associated  
8 with more severe future weather conditions are significant. The quantitative  
9 analysis and qualitative consideration of other factors presented here support the  
10 City's recommendations to make strategic, cost-effective investments focusing on  
11 improving system resilience. As a result, it is my conclusion that such  
12 investments are in the public interest and should be pursued.

13 **VII. CALCULATION OF RATE IMPACTS**

14 **Q. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?**

15 A. This portion of my testimony explains how I performed various calculations  
16 supporting the analyses of delivery rate increases presented in Sections IV, V, and  
17 VI of this testimony. I discuss how (a) delivery revenues and unit costs were  
18 calculated from the Company's presentation; (b) incremental delivery revenues  
19 and unit costs were calculated based on the City's recommendations, (c) overall  
20 rate delivery revenues and unit costs were calculated to combine the effects of the

1 Company and City capital expenditure proposals, and (d) the unit cost delivery  
2 rate increase was levelized.

3 **1. Delivery Revenues and Unit Costs**

4 **Q. PLEASE DESCRIBE THE METHODOLOGY YOU EMPLOYED TO**  
5 **ESTIMATE ELECTRIC DELIVERY REVENUES AND UNIT COSTS**  
6 **BASED UPON THE COMPANY'S INITIAL FILING.**

7 A. The details of my calculation are provided in Exhibit \_\_ [JDS-2]. The starting  
8 point for my electric analysis was the identification of delivery revenues in 2014  
9 prior to the implementation of the rate increase. This information is reported in  
10 Con Edison's Electric Exhibit\_\_[RM-2], Schedule 2 as T&D revenues. I grossed  
11 this amount up for revenue taxes at a 2.9 percent rate. Next, I next identified the  
12 Company's expected electric sales for each year. These amounts are found in  
13 Con Edison's Electric Exhibit\_\_[FR-7] and reported as the total sales volume to  
14 Con Edison and NYPA customers. Adding in the projected 2014 electric rate  
15 increase of \$451.7 million, I calculated the unit cost of electric service before and  
16 after the rate increase. This then formed the basis for my estimate of the  
17 percentage increase in the unit cost of electricity for 2014. For 2015, I calculated  
18 the delivery revenues prior to the rate increase as the product of the 2014 unit cost  
19 after the rate increase and projected 2015 sales from Con Edison's Electric  
20 Exhibit\_\_[FR-7]. By adding in the rate increase amount of \$194.6 million, I

1           calculated the unit costs before and after the rate increase and the resultant  
2           percentage increase. I performed the same calculation for 2016 as I did in 2015.

3   **Q.   PLEASE DESCRIBE THE METHODOLOGY YOU EMPLOYED TO**  
4   **ESTIMATE GAS DELIVERY REVENUES AND UNIT COSTS BASED**  
5   **UPON THE COMPANY’S INITIAL FILING.**

6   A.   I identified the amount of gas revenues prior to the rate increase. This amount  
7       taken from Con Edison’s Gas Exhibit \_\_[AP-9], Schedule 1, which reflected all  
8       gas sales and included commodity costs. To exclude commodity costs, I  
9       identified the amount of purchased gas projected for 2014 and reduced the  
10      revenues by that amount to develop an estimate of delivery revenues. The  
11      purchased gas amount was also taken from Con Edison’s Gas Exhibit \_\_[AP-9],  
12      Schedule 1. Next, I added the proposed delivery increase including the stayout  
13      premium and associated taxes from Con Edison’s Gas Exhibit \_\_[RM-2],  
14      Schedule 2 of \$41.4 million (composed of a rate increase component and a  
15      revenue tax component) to the initial delivery revenue amount to develop delivery  
16      revenues after the rate increase. I then divided that amount by sales, which were  
17      taken from Con Edison’s Gas Exhibit \_\_[GFP-4]. This formed the basis for my  
18      estimate of the percentage increase in the unit cost of gas for 2014. For 2015, I  
19      calculated the delivery revenues prior to the rate increase as the product of the  
20      2014 unit cost after the rate increase and projected gas 2015 sales from Con

1 Edison's Gas Exhibit\_\_[GFP-5]. By adding in the rate increase amount of \$55.4  
2 million, I was then able to calculate the unit costs before and after the rate  
3 increase and the resultant percentage increase. I performed the same calculation  
4 for 2016 as I did in 2015 using sales from Con Edison's Gas Exhibit\_\_[GFP-6].

5 **Q. PLEASE DESCRIBE THE METHODOLOGY YOU EMPLOYED TO**  
6 **ESTIMATE STEAM DELIVERY REVENUES AND UNIT COSTS BASED**  
7 **UPON THE COMPANY'S INITIAL FILING.**

8 A. I began with delivery revenues for 2014 from Con Edison's Steam  
9 Exhibit\_\_[RM-2], Schedule 2. I next reflected the proposed increase with the  
10 stayout premium and applicable taxes from the same source. Sales levels were  
11 taken from Con Edison's Steam Exhibits\_\_[SFP-1],\_\_[SFP-2], and\_\_[SFP-3]. I  
12 then followed the same process as I did for electric and gas by employing the rate  
13 increases and applicable taxes shown in Con Edison's Steam Exhibit\_\_[RM-2],  
14 Schedule 2.

15 **Q. WHY DID YOU EMPLOY DIFFERENT APPROACHES AND DATA TO**  
16 **CALCULATE THE RATE INCREASES FOR EACH BUSINESS?**

17 A. It was not possible to follow a uniform approach for all three businesses. The  
18 pertinent information is provided in slightly different formats for each business  
19 and as such required a slightly different approach to determining the delivery  
20 percentage increases.

1 Q. YOUR UNIT COST ESTIMATES FOR EACH TYPE OF UTILITY  
2 SERVICE DO NOT APPEAR TO MATCH THE AMOUNTS ACTUALLY  
3 CHARGED IN CON EDISON'S TARIFFS. WHY?

4 A. As I previously explained, my analysis combined revenues and sales for all  
5 delivery services provided by the Company. Thus the unit costs for electric, gas,  
6 and steam service will not necessarily match the amounts designated in tariffs.

7 **2. Incremental Delivery Rate And Unit Costs**

8 Q. PLEASE DESCRIBE THE METHODOLOGY YOU EMPLOYED TO  
9 ESTIMATE THE INCREMENTAL RATE IMPACT ASSOCIATED WITH  
10 IMPLEMENTING THE CITY'S RECOMMENDATIONS.

11 A. The revenue requirement calculations for electric, gas, and steam operations are  
12 provided in Exhibit \_\_ [JDS-5]. The development of these revenue estimates  
13 required the following inputs: (a) assumptions about the timing and costs of the  
14 projects; (b) the depreciation rates for the projects, (c) the tax life of the projects,  
15 (d) the rate of return on the projects, (e) the Company's effective blended income  
16 tax rate and (f) the property tax rate for the projects. Once these values were  
17 established, the incremental revenue requirements were determined as the annual  
18 sum of depreciation, property taxes, income taxes, and return on rate base.

19 Q. HOW WERE THE COSTS AND TIMING OF THE PROJECTS IN THE  
20 CITY'S RECOMMENDATIONS ESTIMATED?

1 A. As I noted previously, it was necessary to assume that the City's  
2 recommendations would increase capital expenditures by 6 to 15 percent each  
3 year for the next three years, with additional capital investments thereafter related  
4 to the gas main replacement program. For the purpose of computing the revenue  
5 requirements, I conservatively assumed that (a) all investments would be in-  
6 service at the beginning of each calendar year and (b) capital expenditures would  
7 match actual additions to rate base for each year. While these assumptions will  
8 tend to overstate the actual revenue requirement impact for any year, they fully  
9 capture the costs associated with the City's recommendations and provide an  
10 upper bound for the rate impact estimates.

11 **Q. WHAT AVERAGE SERVICE LIVES DID YOU ASSUME FOR THE**  
12 **PURPOSE OF DETERMINING BOOK DEPRECIATION?**

13 A. Overall, I concluded that a depreciation rate of 2.5 percent reasonably reflects the  
14 average expected life of the assets.

15 **Q. WHAT IS THE BASIS FOR THIS ASSUMPTION?**

16 A. I relied on information from three sources. First the recommendations of the  
17 Electric Panel and the Gas and Steam Panel generally refer to long lived assets.  
18 Second, I relied on the Company's responses to NYC IRs-518, 519, and 520  
19 which indicate that the tax depreciation life for most assets which the Company  
20 constructs to transmit and distribute utility service have a tax depreciation rate

Cases: 13-E-0030  
13-G-0031  
13-S-0032

John D. Stewart

1 based on a 20-year period. This is the longest period available for tax  
2 depreciation on property other than real estate and it is indicative of a service life  
3 exceeding 25 years. Finally I reviewed the projects reflected in the City's  
4 recommendations and I consulted the depreciation schedules reflecting the life for  
5 similar transmission and distribution assets. My assumption of a 40-year life is  
6 generally consistent with that information. Attached as Exhibit \_\_ [JDS-11] is a  
7 compilation of the discovery responses from Con Edison that I relied upon in  
8 preparing my testimony.

9 **Q. DID YOU REFLECT NET SALVAGE IN YOUR DETERMINATION OF**  
10 **THE DEPRECIATION RATE?**

11 A. No.

12 **Q. HOW WOULD YOUR CALCULATIONS CHANGE IF YOU WERE TO**  
13 **CONSIDER NET SALVAGE?**

14 A. Based on my review of the Company's depreciation schedules for transmission  
15 and distribution equipment, the depreciation rate for gas capital additions would  
16 be about 0.5 percent lower and the rate for electric capital additions would be  
17 about 0.5 percent higher.

18 **Q. WHAT TAX DEPRECIATION RATES DID YOU ASSUME IN YOUR**  
19 **ANALYSIS?**

20 A. Based on the Company's responses to NYC IRs-518, 519, and 520 I assumed tax

1 depreciation based on the Modified Accelerated Cost Recovery System rates for a  
2 20-year period.

3 **Q. WHAT WAS THE BASIS FOR YOUR ASSUMPTIONS REGARDING**  
4 **THE PROPERTY TAX RATE?**

5 A. I assumed property tax rates based on the ratio of property taxes to net utility  
6 plant for the 2014 rate year. This produced property tax rates equal in the 6.5  
7 percent to 6.8 percent range for the three businesses.

8 **Q. WHAT RETURN ON RATE BASE DID YOU ASSUME?**

9 A. I assumed a 7.94 percent rate of return on rate base based on the Company's filed  
10 position in the rate case adjusted to reflect the 50 basis point stayout premium  
11 which it requested. To the extent that the PSC adopts a lower result, the overall  
12 rate impact associated with the City's recommendations will decline. I addressed  
13 the reason why I reflected the Company's filed position to estimate rate impacts  
14 earlier in this testimony.

15 **Q. TO BE CLEAR, ARE YOU SUPPORTING THE COMPANY'S**  
16 **REQUESTED RATE OF RETURN?**

17 A. No. I offer no opinion here on its request.

18 **Q. SIMILARLY, ARE YOU OFFERING ANY OPINION ON ITS**  
19 **REQUESTED STAYOUT PREMIUM IF THERE IS A MULTI-YEAR**  
20 **RATE PLAN?**

1 A. No.

2 **Q. WHAT EFFECTIVE INCOME TAX RATE DID YOU ASSUME?**

3 A. I assume a 40.61 percent effective income tax rate. This rate is based on the  
4 calculations presented by Con Edison's Accounting Panel in Exhibits \_\_[AP-2] for  
5 each of its electric, gas, and steam operations.

6 **3. Overall Rate Impacts**

7 **Q. HOW DID YOU CALCULATE THE OVERALL RATE IMPACTS TO**  
8 **CON EDISON CUSTOMERS ASSOCIATED WITH THE RATE**  
9 **INCREASES PROPOSED BY THE COMPANY AND THE CITY'S**  
10 **RECOMMENDATIONS?**

11 A. I layered the estimated annual revenue requirements and unit cost information  
12 associated with the City's recommendations on top of the Con Edison revenue  
13 requirement and unit cost information. As previously noted, I did not attempt to  
14 reflect the impact of any rate case adjustments on the Company's revenue  
15 requirement and unit cost data in order to provide an absolute upper bound for the  
16 overall rate effect of the City's proposals.

17 **4. Rate Levelization**

18 **Q. PLEASE EXPLAIN HOW YOU LEVELIZED RATES.**

19 A. As I noted previously, while the Company levelized the annual monetary increase  
20 in rates, my preference was to levelize the annual percentage increase in the unit

John D. Stewart

1 cost of delivery service. Exhibit \_\_ [JDS-4] provides the details of my rate  
2 levelization methodology. I first calculated the accumulated amount of revenues  
3 over a three-year period. Thus, the rate increase for 2014 was counted three  
4 times, the rate increase in 2015 was counted twice and the rate increase in 2016  
5 was counted once. Like the Company, I assumed the average interest rate for the  
6 purpose of levelization was the 2.1 percent return on other customer provided  
7 capital. Based on this rate, I computed the present value of the Company's  
8 accumulated rate increases over the three years. I then used the Excel Solver  
9 function to determine the percentage increase in delivery service unit costs, based  
10 on the Company's sales forecasts, which when applied for three years to the  
11 previous year's unit cost would produce accumulated revenues with a present  
12 value equal to the present value of the accumulated rate increases originally  
13 requested by the Company. This result reflects the rate increase percentage which  
14 if applied over the next three years will have the same present value as that of the  
15 revenues which the Company initially presented on a cost of service basis prior to  
16 any rate sculpting.

17 **Q. DOES THIS CONCLUDE YOUR TESTIMONY?**

18 A. Yes, it does.
