

BEFORE THE  
STATE OF NEW YORK  
PUBLIC SERVICE COMMISSION

---

In the Matter of

Niagara Mohawk Power Corporation d/b/a National Grid

Cases 24-E-0322 & 24-G-0323

September 26, 2024

---

Prepared Testimony of:

Staff Electric Rates Panel (SERP)

Brian Grode  
Utility Engineering Specialist 2

Andrew Timbrook  
Utility Engineering Specialist 3

Office of Rates and Tariffs  
State of New York  
Department of Public Service  
Three Empire State Plaza  
Albany, New York 12223-1350

1 Q. Members of the Staff Electric Rates Panel,  
2 referred to as the SERP, please state your  
3 names, employer, and business address.

4 A. Our names are Brian Grode and Andrew Timbrook.  
5 We are employed by the New York State Department  
6 of Public Service, referred to as the  
7 Department. Our business address is Three  
8 Empire State Plaza, Albany, New York 12223-1350.

9 Q. Mr. Grode, is your position in the Department,  
10 educational background, professional experience  
11 and a list of previous testimony provided in  
12 another panel's testimony?

13 A. Yes, this information is stated in the Staff Gas  
14 Rates Panel, referred to as the SGRP.

15 Q. Mr. Timbrook, is your position in the  
16 Department, educational background, professional  
17 experience and a list of previous testimony  
18 provided in another panel's testimony?

19 A. Yes, my educational background and professional  
20 experience can be found in the Staff Net Plant  
21 and Gas Infrastructure and Operations Panel,  
22 referred to as the SNPGIOP.

23 **Summary of Testimony**

24 Q. How will the Panel refer to Niagara Mohawk Power

1           Corporation d/b/a National Grid in your  
2           testimony?

3   A.    We will refer to Niagara Mohawk Power  
4           Corporation d/b/a National Grid as NMPC, or the  
5           Company.

6   Q.    What is the purpose of the Panel's testimony in  
7           these proceedings?

8   A.    We are responding to NMPC's proposals to: (1)  
9           the Rate Year electric revenue forecast; (2) the  
10           electric embedded cost of service study,  
11           including the minimum system study; (3) electric  
12           revenue allocation; (4) electric rate design and  
13           bill impacts; and (5) tariff modifications for  
14           its electric business.

15   Q.    Did the Panel review the Company's proposals  
16           included in its Electric Rate Design Panel  
17           testimony?

18   A.    Yes, we reviewed the Company's initial Electric  
19           Rate Design Panel testimony filed on May 28,  
20           2024 and subsequent Corrections and Updates  
21           Testimony of the Electric Rate Design Panel  
22           filed on July 22, 2024.

23   Q.    In your testimony, will you refer to, or  
24           otherwise rely upon, any information obtained

1 during the discovery phase of this proceeding?

2 A. Yes. We will refer to, and have relied upon,  
3 several responses provided by the Company to  
4 Information Requests, or IRs. These responses  
5 are contained within Exhibit    (SERP-1). We will  
6 refer to these responses by the designation  
7 given to them during discovery, e.g., DPS-123.

8 Q. How many exhibits are you offering in connection  
9 with your testimony?

10 A. We are sponsoring fourteen exhibits.

11 Q. Would you briefly describe each exhibit?

12 A. Exhibit    (SERP-1) contains the Company's  
13 responses to IRs we have relied upon.

1 contains our proposed Electric Vehicle Smart  
2 Charging rates. Exhibit\_\_ (SERP-9) contains our  
3 proposed bill impacts based on our proposed  
4 revenue allocation and rate design.  
5 Exhibit\_\_ (SERP-10) contains our Revenue  
6 Decoupling Mechanism targets. Exhibit\_\_ (SERP-  
7 11) contains our streetlighting rate design.  
8 Exhibit\_\_ (SERP-12) contains our calculation of  
9 outage credits. Exhibit\_\_ (SERP-13) contains our  
10 incremental customer charges for voluntary time  
11 of use rates. Finally, Exhibit\_\_ (SERP-14)  
12 contains our incremental customer charges for  
13 hourly pricing rates.

14 Q. What is the Historical Test Year in this  
15 proceeding?

16 A. The Historical Test Year, or HTY is the twelve  
17 months ending December 31, 2023.

18 Q. What time period does the Company Rate Year  
19 entail?

20 A. The Company's Rate Year, or RY, is from April 1,  
21 2025 thru March 31, 2026. The Company also  
22 provided three additional years it refers to as  
23 Data Years, or DY, with DY1 being the twelve  
24 months ending March 31, 2027, DY2 being the

1                   twelve months ending March 31, 2028, and DY3  
2                   being the twelve months ending March 31, 2029.

3                   **Revenue Forecast**

4   Q.    What revenue forecasts did the Panel review?  
5   A.    The Panel reviewed base delivery revenues and  
6                   other revenues including, but not limited to,  
7                   late payment charges, merchant function charges,  
8                   or MFC, and commodity revenues. Our price out  
9                   of revenues at current rates is found in  
10                  Exhibit    (SERP-2).

11   Q.    Summarize the Panel's adjustments to the  
12                  Company's delivery revenues.

13   A.    Our adjustments to the Company's delivery  
14                  revenues reflect the price out of the Staff  
15                  Forecasting Panel's, or SFP, recommended sales  
16                  and customer forecasts for each Service  
17                  Classification, or SC.Q. Please describe the SCs  
18                  included in the Company's P.S.C. No. 220 -  
19                  Electric and P.S.C. No. 214 - Electric.

20   A.    Served under its electric tariff P.S.C. No. 220  
21                  - Electricity, referred to as the Electric  
22                  Tariff, the Company has SC No. 1 Residential and  
23                  Farm Service, or SC1, SC No. 1-C Residential and  
24                  Farm Service - Optional Large Time of Use Rate,

1           or SC1C, SC No. 2 Small General Service, or SC2,  
2           SC No. 3 Large General Service, or SC3, SC No.  
3           3-A Large General Service, Time of Use Rate, or  
4           SC3A, SC No. 4 Untransformed Service to  
5           Customers Taking Replacement and/or Expansion  
6           Power from Niagara Project of the Power  
7           Authority of the State of New York, or SC4, SC  
8           No. 6 Purchase of Electric Energy and Capacity  
9           from customers with Qualifying On-Site  
10           Generation Facilities, or SC6, SC No. 7 Standby  
11           Service and Optional Rate Service, or SC7, and  
12           SC No. 12 Special Contract Rates, or SC12.  
13           Served under its outdoor lighting tariff P.S.C.  
14           No. 214, referred to as the Lighting Tariff, the  
15           Company has well as SC No. 1 Private Lighting,  
16           or SC1 Light, SC No. 2 Street Lighting, or SC2  
17           Light, SC No. 3 Street Lighting, or SC3 Light,  
18           SC No. 4 Traffic Controls, or SC4 Light, SC No.  
19           5 Street Lighting, or SC5 Light and SC No. 6  
20           Street Lighting, or SC6 Light. We will  
21           sometimes refer to SC1 Light, SC2 Light, SC3  
22           Light, SC4 Light, SC5 Light, and SC6 Light  
23           collectively as the Streetlighting SCs in our  
24           testimony. The Company has multiple sub service

1           classes, where SC2 is separated into SC2 Non  
2           Demand, or SC2ND, and SC2 Demand, or SC2D, SC3  
3           and SC3A are both divided into their respective  
4           Primary, Secondary, Sub Transmission and  
5           Transmission, or SC3 Pri, SC3 Sec, SC3 Sub, SC3  
6           Tran, SC3A Pri, SC3A Sec, SC3A Sub, SC3A Tran,  
7           and SC3A Pri. SC7, SC12, and SC4 also all have  
8           sub classifications that we will refer to as  
9           SC7-X, SC12-Y, SC4-Z, for example SC7-SC2D will  
10          refer to customers whose otherwise applicable SC  
11          is SC2D but take service under SC7.

12   Q.    Did the SFP panel provide forecasted usage and  
13          customer counts for all of the company's  
14          electric SCs?

15   A.    The Panel was provided a usage and customer  
16          count forecast for all SCs except for the  
17          Streetlighting SCs, which the testimony of the  
18          SFP does not contest. In addition, the SFP also  
19          provided a forecast of full-service usage for  
20          the RY.

21   Q.    Please summarize the sales forecast recommended  
22          by the SFP as it related to this Panel's  
23          delivery revenues price out.

24   A.    The total forecasted volumes for the Rate Year

1           is 34,236 Gigawatt hours, or GWh, which is 125  
2           GWh higher than the Company's forecast. The SFP  
3           also provided a full service forecast of 17,615  
4           GWh, which is 73 GWh higher than the Company's  
5           forecasted full service GWh usage.

6   Q.    Summarize the customer bills forecast as  
7           recommended by the SFP.

8   A.    The total forecasted customers for the Rate Year  
9           is 20,714,900 which is 11,603 customers higher  
10          than the Company. Exhibit       (SFP-2) of the SFP  
11          contains the forecasted usage and customer bills  
12          we are using throughout our testimony, excluding  
13          the Streetlighting SCs as the SFP did not  
14          contest those forecasts.

15   Q.    Describe how the Company developed its forecast  
16          of base electric delivery revenue at current  
17          rates in the Rate Year.

18   A.    The forecast revenues shown in Exhibit       (E-RDP-  
19          2CU) were calculated by applying the currently  
20          effective electric rates, as approved by the  
21          Commission in its Order Adopting Terms of Joint  
22          Proposal, Establishing Rate Plans and Reporting  
23          Requirements, issued January 20, 2022 in Cases  
24          20-E-0380 and 20-G-0381;, which we will refer to

1           as the 2022 Rate Order, to the forecasted  
2           billing determinants derived from the electric  
3           sales forecast provided in the direct testimony  
4           of the Company's Electric Load Forecast Panel,  
5           with a separate forecast developed for the  
6           Streetlighting SCs. The outdoor lighting  
7           forecast was priced out based on the current  
8           facility quantities in the billing system as of  
9           December 31, 2023, with some adjustments for  
10          asset sale transactions as well as light-  
11          emitting diode, or LED, conversions. These  
12          forecasts were later updated in the Company's  
13          Corrections and Updates filing.

14       Q.     How did the Company develop its forecasted  
15          billing determinants for the non-Streetlighting  
16          SCs.

17       A.     As stated on page 15 of the initial testimony of  
18          the Company's Electric Rate Design Panel, the  
19          kWh billing determinants by voltage delivery  
20          level, or VDL, for the RY were developed by  
21          applying historical percentages for the twelve  
22          months ended September 2023 to forecasted sales.  
23          The kW billing determinants were developed by  
24          applying a historical load factor ratio to the

1 forecast kWh. The historical load factor ratio  
2 is based on the twelve months ended September  
3 2023 and is equal to historical demand divided  
4 by historical kWh. The reactive kVA, or RkVA,  
5 forecast was based on a historical ratio for  
6 each VDL.

7 Q. Did the Panel use the same methodology as the  
8 Company to forecast billing determinants for the  
9 non-Streetlighting SCs?

10 A. Yes. The Panel forecasted kW and RkVA using the  
11 same ratios as the Company, multiplied by the  
12 forecast provided by the SFP.

13 Q. How did the Company forecast revenues associated  
14 with the Empire Zone Rider and Excelsior Jobs  
15 Program?

16 A. As the Empire Zone Rider, or EZR, program has  
17 been fully closed to customers as of March 2023  
18 and the remaining customer's contract has  
19 expired, the Company did not forecast revenues  
20 associated with the EZR. The Company forecasted  
21 revenue associated with the Excelsior Jobs  
22 Program, or EJP, at the otherwise applicable  
23 standard tariff rates and included that revenue  
24 with the otherwise applicable parent SC

1                   revenues.

2   Q.    Does the Panel accept the Company's forecasted  
3                   EJP revenues?

4   A.    Yes.  In our revenue price out shown in  
5                   Exhibit\_\_ (SERP-2), the Panel uses \$0.959 million  
6                   as our Rate Year EJP discounts, consistent with  
7                   Table 1 on Page 17 of the initial testimony of  
8                   the Company's Electric Rate Design Panel.  This  
9                   is an adjustment from the Company's Exhibit\_\_ (E-  
10                   RDP-2CU) where the Company inadvertently used  
11                   the fiscal year, or FY, 2025 discount level  
12                   instead of the FY 2026 discount level shown in  
13                   Table 1 on Page 17 of the initial testimony of  
14                   the Company's Electric Rate Design Panel.  The  
15                   Company acknowledged this error in the response  
16                   to DPS-990, included in Exhibit\_\_ (SERP-1).

17   Q.    Did the Panel forecast revenues for SC12 using  
18                   the same methodology as the Company?

19   A.    Yes.  The Panel forecasted SC12 revenue using  
20                   the same methodology as described beginning on  
21                   page 17 of the initial testimony of the  
22                   Company's Electric Rate Design Panel.

23   Q.    How did the Company forecast revenues for SC7?

24   A.    As stated on page 18 of the initial testimony of

1 the Company's Electric Rate Design Panel, under  
2 SC7 the Company provides standby service to  
3 customers with onsite generation facilities.  
4 The Company calculates its SC7 revenue forecast  
5 at the otherwise applicable standard rates and  
6 includes that revenue with the otherwise  
7 applicable parent SC revenue, as shown in  
8 Exhibit    (E-RDP-2CU) . As stated on page 19 of  
9 the initial testimony of the Electric Rate  
10 Design Panel, customers under SC3 or SC3A that  
11 are served under SC7's Special Provision F pay a  
12 reduced customer charge. This discount was  
13 based on the HTY discounts and is shown in  
14 Exhibit    (E-RDP-2CU) Schedule 1, Line 30. In  
15 the Corrections and Updates testimony of the  
16 Electric Rate Design Panel on page 8, the  
17 Company explains that the annual discounts were  
18 initially presented as a positive amount in  
19 Exhibit    (E-RDP-2) and should have been a  
20 credit, requiring the updated schedule in  
21 Exhibit (E-RDP-2CU) .

22 Q. Is the Panel adopting the SC7 Discount of  
23 \$106,655?

24 A. Yes. The \$106,655 discount was based on

1           historical values, so we are adopting the  
2           corrected value as described in the Company's  
3           Corrections and Updates filing and shown in  
4           Exhibit    (E-RDP-2CU) Schedule 1, Line 30.

5   Q.    How did the Company forecast RY commodity  
6           revenues?

7   A.    Beginning on page 19 of the initial testimony of  
8           the Company's Electric Rate Design Panel the  
9           Company explains that its overall RY commodity  
10          revenue forecast consists of several elements.  
11          First, the Company's forecast was based on the  
12          Intercontinental Exchange, or ICE, and New York  
13          Mercantile Exchange, or NYMEX, forward curve  
14          market prices. Commodity revenues include  
15          electric supply costs, which are calculated  
16          using forecast monthly zone weighted average  
17          commodity rates multiplied by the forecast kWh  
18          commodity sales for each SC. Second, commodity  
19          revenues include Legacy Transition Charge, or  
20          LTC, costs, which are based on the net market  
21          value associated with legacy purchase power  
22          contracts entered into prior to June 1, 2001.  
23          Third, commodity revenues include the New Hedge  
24          Adjustment, or NHA, which is the net market

1                   value associated with purchase power contracts  
2                   or financial hedges entered into after June 1,  
3                   2001. Fourth, commodity revenues include net  
4                   market value associated with the NYPA Rural and  
5                   Domestic Power. Additionally, the Company's  
6                   forecasted commodity rates used the proposed  
7                   updated Loss Factors from the Company's 2023  
8                   NMPC Line Loss Study Report found in  
9                   Exhibit    (E-RDP-12) .

10   Q.   Did the Panel make any changes to the  
11                   methodology used to calculate RY commodity  
12                   revenues?

13   A.   No, the Panel does not recommend changes to the  
14                   methodology for calculating RY commodity  
15                   revenues. We multiplied the RY forecasted kWh  
16                   provided by the SFP by the commodity rates used  
17                   by the Company to develop our RY commodity  
18                   revenues.

19   Q.   How did the Company forecast the remaining  
20                   components of the revenue forecast?

21   A.   As stated on page 21 of the initial testimony of  
22                   the Company's Electric Rate Design Panel, the  
23                   additional revenue components are separate  
24                   surcharges that are applicable to specific SCs

1 and are based on the current surcharge rates  
2 applied to the RY sales forecast for each SC,  
3 though with a few exceptions. The MFC revenue,  
4 which will be discussed in detail later, is  
5 designed to recover electric supply related  
6 costs and developed by applying the current MFC  
7 Uncollectible Expense and Working Capital  
8 percentages to the forecast full-service supply  
9 charges, and the Supply Procurement and Credit  
10 and Collections charges to the full-service kWh.  
11 The System Benefit Charge, or SBC, recovers the  
12 cost of the New York State Energy Research and  
13 Development Authority, or NYSERDA, Clean Energy  
14 Fund budgeted to the Company. The Dynamic Load  
15 Management, or DLM, and Value of Distributed  
16 Energy Resource Value Stack, or VDER, forecast  
17 is based on reconciled HTY revenue. The Company  
18 also calculated forecasted ESCO commodity  
19 revenues by taking the total Company forecasted  
20 kWh usage by SC and subtracting the full-service  
21 kWh, then multiplying by the applicable  
22 forecasted dollar per kWh supply charge for that  
23 SC each month.

24 Q. Did the Panel make any changes to the

1           methodologies for calculating the revenues  
2           described previously?

3   A.    No.  To the extent that any of the forecasted  
4           revenues described previously are dependent on a  
5           kWh forecast, the Panel adjusted those revenues  
6           for the forecast provided by the SFP.  Otherwise  
7           we used a consistent methodology to the  
8           Company's to develop our RY amounts.  While we  
9           did not change any methodologies to calculate  
10          these revenues, in the response to DPS-1004, as  
11          shown in Exhibit   (SERP-1), the Company updated  
12          revenues associated with the Village of Clayton  
13          Underground Revenue based on a Moody's Inflation  
14          Forecast.  This results in updated revenues of  
15          \$265,642 compared to the Exhibit   (E-RDP-2CU)  
16          value of \$360,000.  Our Panel uses the updated  
17          \$265,642 as our revenues associated with the  
18          Village of Clayton Underground Revenues, as  
19          shown in Exhibit   (SERP-2) Line 26.

20   Q.    Did the Panel provide any additional corrections  
21          to its revenues in responses to IRs?

22   A.    Yes.  In the response to DPS-776, as shown in  
23          Exhibit   (SERP-1), the Company corrected the GRT  
24          for multiple SCs, noting that this correction

1           will not impact the proposed revenue requirement  
2           as the GRT expenses match the GRT revenues.  
3           Additionally, in the response to DPS-778, as  
4           shown in Exhibit    (SERP-1), the Company  
5           corrected revenues associated with NYPA  
6           projects.

7           **Embedded Cost of Service Study**

8   Q.    Please briefly describe the purpose of an  
9        Embedded Cost of Service, or ECOS, study?

10   A.   The purpose of an ECOS study is to assign costs  
11      to different SCs based on how customers within  
12      those classes cause costs to be incurred. The  
13      results of an ECOS study are used as a guide in  
14      allocating revenue responsibility between the  
15      different classes of customers.

16   Q.   What information does an ECOS study provide?

17   A.   The results of the ECOS study are expressed as a  
18      total system rate of return, as well as class-  
19      specific rates of return. The results of an  
20      ECOS study provide a summary of the individual  
21      class rate of return which, in turn, shows the  
22      level at which each class contributes to the  
23      total system rate of return. The rate of return  
24      for a class is an effective way to measure how

1           well the class revenues align to the Company's  
2           costs to provide service to that particular  
3           customer class. An ECOS study has three major  
4           steps: functionalization, classification, and  
5           allocation.

6   Q.    Please explain the three major steps.

7   A.    Functionalization is the process of assigning  
8           the Company's rate base and expense items to  
9           specific utility operating functions. The  
10          operating functions are: transmission, primary  
11          distribution, secondary distribution, billing,  
12          regulatory, competitive supply, competitive  
13          collections and competitive billing.  
14          Classification is used to further define the  
15          functionalized rate base and expense items into  
16          demand, energy, and customer components. The  
17          final step - allocation - assigns the components  
18          to customer classes reflective of the cost that  
19          the class imposes on the utility.

20   Q.    Did the Company submit an ECOS study in this  
21          rate proceeding?

22   A.    Yes. The Company submitted a "pro forma" ECOS  
23          study as Exhibit    (E-RDP-3CU), referred to as  
24          the 2024 ECOS study. A "pro-forma" ECOS study

1           is one where the study inputs, e.g., revenues,  
2           system loads, expenses, and rate base, are  
3           forecasted for the upcoming Rate Year. In  
4           addition, the Company provided a historical ECOS  
5           study for illustrative purposes only. The  
6           historical ECOS study reflects the allocation of  
7           rate base, costs, and revenue in the Historical  
8           Test Year. The Company notes that these amounts  
9           are not weather normalized and include non-  
10           recurring items from the Historical Test Year.

11   Q.    Please describe the 2024 ECOS study that NMPC  
12           presented in its rate filings.

13   A.    The 2024 ECOS Study shows the projected rates of  
14           return, at current rates, for the rate classes  
15           served by the Company as well as each class's  
16           relative rate of return for the Rate Year. A  
17           class's relative rate of return is the class's  
18           rate of return divided by the system rate of  
19           return. It also shows the change in base  
20           transmission and distribution delivery revenue  
21           required for each class to produce a system  
22           average return of 7.12 percent.

23   Q.    Please list the SCs considered in the Company's  
24           2024 ECOS Study.

1 A. According to Exhibit\_\_ (E-RDP-3CU), Schedule 1,  
2 the Company includes SC1, SC1C, SC2ND, SC2D, SC3  
3 Sec, SC3 Pri, SC3 Tran, SC3A Sec, SC3A Sub, SC3A  
4 Tran, and the Streetlighting SCs rolled into one  
5 Lighting category.

6 **Minimum System Study**

7 Q. Please describe the methodology the Company used  
8 to allocate the portions of Overhead Assets and  
9 Underground Assets that are classified as  
10 customer related or demand related.

11 A. Beginning on page 31 of the initial testimony of  
12 the Electric Rate Design Panel, the Company  
13 states that a minimum system study determined  
14 the demand and customer splits for Overhead  
15 Assets and Underground Assets, presented in  
16 Exhibit\_\_ (E-RDP-3CU), Schedule 9X. The minimum  
17 system study determines the cost of the smallest  
18 capacity conduct that would fulfill the purpose  
19 of connecting customers to the distribution  
20 system that the utility would install. Then,  
21 the cost of the entire system is determined.  
22 The minimum system and entire system costs are  
23 determined using the current costs for the  
24 assets installed, or functionally equivalent

1           assets if current costs are not available. The  
2           ratio of minimum system cost to entire system  
3           cost is the Customer component of costs. The  
4           Customer component is allocated among the  
5           classes on a per-customer basis, because the  
6           cost of the minimum system is largely determined  
7           by the length of the conductors, which in turn  
8           is determined by the number of customers  
9           connected. The Company calculated separate  
10          minimum system ratios for Primary Overhead,  
11          Secondary Overhead, Primary Underground and  
12          Secondary Underground and according to  
13          Exhibit\_\_ (E-RDP-3CU) are 83.5 percent, 86.5  
14          percent, 38.40 percent, and 10.3 percent,  
15          respectively.

16   Q.   Did the Company use the minimum system ratios  
17          calculated with their current minimum system  
18          study?

19   A.   No. The Company averaged the 83.5 percent, 86.5  
20          percent, 38.40 percent, and 10.3 percent  
21          Customer components with their respective prior  
22          period studies. As explained in the response to  
23          DPS-826, included in Exhibit\_\_ (SERP-1), the  
24          prior period included purchasing data from 2014

1           through 2018. This resulted in minimum system  
2           ratios of 86.6 percent for Primary Overhead,  
3           92.5 percent for Secondary Overhead, 46.40  
4           percent for Primary Underground, and 11.70  
5           percent for Secondary Underground.

6   Q.    Does the Panel support the averaging of minimum  
7           system studies?

8   A.    Yes. This approach gives weight to both the  
9           costs incurred in more recent years with the  
10           costs incurred over a longer time-period to  
11           provide a balanced approach to defining the  
12           minimum system.

13   Q.    Does the 2024 ECOS Study reflect the load-  
14           carrying capacity of the minimum system?

15   A.    Yes. As described on page 33 of the Company's  
16           initial testimony of the Electric Rate Design  
17           Panel, even though their cost is determined  
18           primarily by length the conductors identified in  
19           the minimum system study have load-carrying  
20           capacity. The Company did not allocate demand-  
21           related costs for Overhead Assets or Underground  
22           Assets to SC1, SC1C, and SC2ND because the  
23           minimum system would be able to meet the peak  
24           load for all or almost all of the customers in

1                   those SCs.

2   Q.    Were all components of the revenue requirement  
3                   and revenues reflected in the 2024 ECOS study?

4   A.    Except for the revenue and expenses for gross  
5                   revenue tax, which would exactly offset each  
6                   other, all components of the revenue requirement  
7                   and all components of revenue are reflected in  
8                   the 2024 ECOS study.

9   Q.    Did the Company perform a historical ECOS study  
10                  in this filing?

11   A.    Yes. The Company provided a historical ECOS  
12                  study for illustrative purposes only pursuant to  
13                  Section IV.4.9 of the Joint Proposal adopted in  
14                  the 2020 Rate Order. The historical ECOS study  
15                  is found in Exhibit        (E-RDP-14) and uses actual  
16                  revenues and expenses through the HTY.

17   Q.    Did the Company use the results of the  
18                  historical ECOS study in its revenue allocation?

19   A.    As stated on page 40 of the Company's Electric  
20                  Rate Design Panel initial testimony, the Company  
21                  does not support the use of this study for  
22                  multiple reasons. First, the Company states  
23                  that revenues in the historical ECOS study are  
24                  not weather normalized and are not generally

normalized, so it includes costs from the HTY that may not occur in the RY. Second, the Company states that the historical ECOS, unlike the 2024 ECOS, which is a pro forma, does not fully reflect the sales, customer counts, rate base, and costs that are expected to occur in the RY.

8 Q. Will the Panel be relying on the Company's 2024  
9 pro forma ECOS study for revenue allocation and  
10 rate design?

11 A. We recognize and acknowledge the Company's  
12 points on why using the historical ECOS filed by  
13 the Company in this proceeding is not ideal. An  
14 ECOS should reflect normalized costs to  
15 accurately portray the SCs individual rates of  
16 return as a guide for revenue allocation.  
17 However, the pro forma ECOS, while normalized,  
18 relies on costs that are forecasted which can  
19 also be inaccurate and vary between Staff and  
20 the Company. We used the pro forma ECOS because  
21 it is the best representation of normalized  
22 costs. However, we recommend that in the  
23 Company's next rate filing, the Company files a  
24 normalized historical gas ECOS study. A

1                   normalized historical ECOS study, when compared  
2                   to a pro forma ECOS study, would indicate  
3                   whether the rate of return in the pro forma  
4                   deviate from the historical normalized costs and  
5                   allow for a determination on whether the pro  
6                   forma is appropriate for use as a guide for  
7                   revenue allocation. It would also eliminate the  
8                   concerns related to using a historical ECOS that  
9                   is not normalized.

10   Q.   Does the Panel have any further recommendations  
11                   regarding the Company's ECOS study?

12   A.   Yes. In the event of a one-year litigated case  
13                   or a multi-year settlement, the Panel recommends  
14                   that the Company to rerun the ECOS study to  
15                   reflect either approved or agreed upon expenses,  
16                   rate base, and revenues to be used for revenue  
17                   allocation and that any calculations based on  
18                   the ECOS study be rerun at that time with the  
19                   Commission approved revenue requirement.

20   **Merchant Function Charge**

21   Q.   Please describe the Merchant Function Charge,  
22                   referred to as the MFC.

23   A.   The MFC is a charge that is applied to full-  
24                   service customers and includes several

1 components that are designed to recover costs  
2 associated with commodity-related credit and  
3 collections services, commodity-related  
4 uncollectible account expenses, electric supply  
5 procurement costs, and working capital for  
6 electric supply. For energy service companies  
7 or ESCOs that participate in the Company's  
8 purchase of receivables, or POR, program, the  
9 MFC is designed to recover the commodity-related  
10 credit and collections and uncollectible  
11 expenses.

12 Q. Did the Company propose any changes to the MFC?

13 A. No. However, the Company updated the commodity-  
14 related credit and collections services,  
15 commodity-related uncollectible account  
16 expenses, electric supply procurement costs, and  
17 working capital for electric supply to reflect  
18 the most recent ECOS study results and updated  
19 forecasts. The Company did not propose  
20 methodological changes.

21 Q. Did the Panel make any changes to the MFC?

22 A. We do not recommend any changes but we updated  
23 the MFC revenues at current rates to reflect the  
24 volumetric forecast to correspond with the full

1                   service forecast provided by the SFP.  
2                   However, the Panel's MFC at current rates does  
3                   not reflect the changes to the new write off  
4                   factor described in the Staff Accounting Panel,  
5                   or SAP. Therefore, the MFC at current rates  
6                   should also be updated to reflect the  
7                   recommended net write off factor as described in  
8                   the SAP prior to the adoption of new rates in  
9                   this proceeding. For MFC revenues at proposed  
10                  rates we updated the volumetric forecast to  
11                  correspond with the forecast provided by the SFP  
12                  as well as the Pre Tax Weighted Cost of Capital  
13                  and Uncollectible Factor as provided by the SAP.  
14                  Our recommended target for MFC at current rates  
15                  in the Rate Year is \$24,970,832 as shown in  
16                  Exhibit    (SERP-2) Line 29.

17                  **Revenue Allocation**

18   Q.   Please explain the Company's proposed revenue  
19                  allocation methodology.

20   A.   The Company's proposed revenue allocation shown  
21                  in Exhibit    (E-RDP-4CU) is intended to move the  
22                  revenue produced by each SC closer to its  
23                  revenue requirement as determined in the  
24                  electric ECOS study. In developing the proposed

1           revenue allocations, the Company considered the  
2           costs to provide the type and quality of service  
3           required by each SC as determined in the ECOS  
4           study, while mitigating extreme bill impacts on  
5           SCs, a widely accepted concept known as  
6           “gradualism.”

7   Q.    What is a “tolerance band,” and why is it used?

8   A.    A tolerance band is used to account for the  
9           imprecise nature of an ECOS study. The Company  
10          proposes to use a plus or minus 25 percent  
11          tolerance band around the overall system rate of  
12          return, or 0.75 and 1.25 on a unitized basis.  
13          SCs are considered deficient or in surplus if  
14          the class specific rate of return falls outside  
15          the band. On a unitized basis, SCs with a  
16          unitized rate of return between 0.75 and 1.25  
17          are considered within the tolerance band.

18   Q.    Please describe how the Company allocates the  
19          proposed revenue increases to each of the SCs.

20   A.    The Company allocates the revenue increases, net  
21          of gross revenue tax, to SCs based on their  
22          individual unitized rates of return, which are  
23          shown in Exhibit   (E-RDP-4CU), Schedule 1. SCs  
24          within a tolerance band, which the Company

1           proposes be between 0.75 and 1.25 rates of  
2           return on a unitized basis, were given near  
3           system average increase. The Company also  
4           proposed additional tolerance bands for SCs with  
5           unitized rates of return below 0.75 and above  
6           1.25. For these SCs, the Company proposes above  
7           or below system average increases depending on  
8           whether they are under or over contributing,  
9           with the total increase for all SCs equaling the  
10          total incremental gross base delivery revenue  
11          requirement. In Exhibit    (E-RDP-4CU), Schedule  
12          1 Lines 13 through 25, the Company refers to the  
13          percent increases as Low for SCs with rates of  
14          return on a unitized basis below negative 0.50,  
15          Under for SCs with rates of return on a unitized  
16          basis between negative 0.50 and 0.75, Within for  
17          SCs with rates of return on a unitized basis  
18          between 0.75 and 1.25, Over for SCs with rates  
19          of return on a unitized basis between 1.25 and  
20          2.00, High for SCs with rates of return on a  
21          unitized basis between 2.00 and 5.75, and V High  
22          for SCs with rates of return above 5.75. The  
23          proposed gross base delivery revenue requirement  
24          was then adjusted to remove gross receipts tax,

1                   MFC, and other revenues.

2   Q.    Does the Panel support the usage of a 25 percent  
3                   tolerance band?

4   A.    Yes.

5   Q.    What were the Company's results of applying the  
6                   25 percent tolerance band?

7   A.    Based on Exhibit    (E-RDP-4CU), Schedule 1, the  
8                   SCs found to be Within the tolerance band after  
9                   the Company's Corrections and Updates filing are  
10                  SC1, SC2ND, SC3 Sec, and SC3 Pri. The SCs found  
11                  to be Under were SC2D and Lighting. The SCs  
12                  found to be Over were SC3 Tran. The SCs found  
13                  to be High are SC1C, SC3A Sub, and SC3A Tran.

14   Q.    Did the Company give SCs within the tolerance  
15                  band the system average increase?

16   A.    No. In Exhibit    (E-RDP-4CU), Schedule 1 Line 25  
17                  states the system average would be  
18                  26.19 percent, but the Company gives SCs labeled  
19                  Within a 26.92 percent increase.

20   Q.    Why did the Company give these SCs an increase  
21                  slightly above the system average?

22   A.    In the response to DPS-774, included in  
23                  Exhibit    (SERP-1), the Company explains that  
24                  since these SCs were nearer to the bottom of the

1           tolerance band than to the top, it elected to  
2           assign them a slightly higher than average  
3           revenue increase.

4   Q.    How did the Company apply the revenue  
5           requirement increases to the remaining SCs?

6   A.    The Company includes all of the increases  
7           applied to SCs in Exhibit \_\_ (E-RDP-4CU), Schedule  
8           1. SCs labeled Under received a 29.68 percent  
9           increase, SCs labeled Over received a 22.98  
10           percent increase, and SCs labeled High received  
11           a 2.87 percent increase. As previously  
12           mentioned, SCs within the tolerance band  
13           received an increase of 26.92 percent.

14   Q.    Are there any additional steps in revenue  
15           allocation that the Company performs?

16   A.    Yes. After the Company calculates the initial  
17           revenue increases, the Company applies the  
18           difference in revenues associated with the MFC,  
19           ETIP, and various billing fees and late payment  
20           charge revenues by SC. For example, if the MFC  
21           for SC1 were to increase between current rates  
22           and proposed rates, the incremental revenue  
23           requirement would decrease by the incremental  
24           increase in MFC collected from SC1. These

1 changes in MFC and fees is shown in Exhibit\_\_ (E-  
2 RDP-4CU) Schedule 1, lines 20 through 23. In  
3 the response to DPS-1024, as shown in  
4 Exhibit\_\_ (SERP-1), the Company stated that the  
5 incremental customer charge was inadvertently  
6 not updated between the original filing and the  
7 Corrections and Updates filing. The incremental  
8 increase in customer charge fees should be  
9 \$78,758 based on the Company's Corrections and  
10 Updates filing.

11 Q. Does the Panel support the revenue allocation  
12 methodology of the Company?

13 A. The Panel agrees with the concept of gradualism  
14 and performs revenue allocation with gradualism  
15 in mind. The Panel also agrees with the concept  
16 of using tolerance bands of 25 percent in  
17 revenue allocation. However, we recommend using  
18 a single tolerance band from 0.75 to 1.25 rates  
19 of return on a unitized basis, with any SCs  
20 within the tolerance band receiving a revenue  
21 increase equal to the system average increase.  
22 The Company's proposal to give SCs within the  
23 tolerance band a higher than average increase  
24 undermines the existence of a tolerance band, as

1           a SC within the tolerance band is implied to  
2           have produced sufficient revenues relative to  
3           their cost of service. For SCs below the  
4           tolerance band lower limit of 0.75, we recommend  
5           120 percent of the system average increase. For  
6           SCs above the tolerance band upper limit, we  
7           recommend 80 percent of the system average  
8           increase. We also recommend against using the  
9           judgement line found on Line 28 of Exhibit\_\_ (E-  
10          RDP4CU), Schedule 1. To the extent that our  
11          revenue allocation proposal would over collect  
12          or under collect the proposed revenue  
13          requirement, we return the surplus or collect  
14          the deficiency from SCs in proportion to their  
15          delivery revenues at current rates.

16          Q.    Why do you recommend a single tolerance band?

17          A.    Generally the results of the ECOS study  
18          presented in Exhibit\_\_ (E-RDP-3CU) show that all  
19          SCs are relatively close to the system average  
20          rate of return. The highest unitized rates of  
21          return is 4.36 for SC1C, with no other SC above  
22          2.7. The lowest unitized rate of return is 0.50  
23          for Streetlighting. The unitized rates of  
24          return are shown in the Company's Exhibit\_\_ (E-

1                   RDP-4CU), Schedule 1.

2   Q.    What are the results of the Panel's revenue  
3                   allocation?

4   A.   The Panel allocates the system average increase  
5                   of 5.10 percent to SCs within the tolerance  
6                   band. The SCs that are considered over  
7                   contributing receive a 4.08 percent, which is  
8                   0.80 percent of the system average increase, and  
9                   SCs that are considered under contributing  
10                  receive a 6.11 percent increase, which is 1.20  
11                  percent of the system average increase. A  
12                  summary of the Panel's revenue allocation is  
13                  shown in Exhibit    (SERP-3) .

14   Q.    Do you have anything additional to state  
15                  regarding the results of your revenue  
16                  allocation?

17   A.   Yes. At the time we were preparing our  
18                  recommended revenue allocation, the Staff  
19                  Revenue Requirements Panel, or SRRP, provided us  
20                  an incorrect recommended base revenue increase  
21                  of \$130.2 million. Our recommended revenue  
22                  allocation reflects this incorrect base rate  
23                  increase. As the SRRP testimony states, the  
24                  correct base revenue increase is \$142.0 million.

1        While the rates and resulting bill impacts from  
2        using the corrected base revenue increase will  
3        vary from what is shown in our exhibits, the  
4        methodology of our recommended revenue  
5        allocation and rate design would remain the same  
6        as described in our testimony.

7        **Rate Design**

8        Q.      What considerations did the Company take when  
9            designing its proposed rates?

10      A.     On page 44 of the initial testimony of the  
11        Electric Rate Design Panel, the Company outlines  
12        its overall process for rate design. The  
13        Company considered collection of the target  
14        revenues for each SC based on its revenue  
15        allocation and providing price signals to  
16        customers to reflect the effect of their usage  
17        on the overall system. The Company did not  
18        elect to increase the rates for reactive power.  
19        Other components of rate design are the  
20        incremental Energy Affordability Program, or  
21        EAP, discounts, and the ETIP Adder and NYPA  
22        credit which account for the Company's energy  
23        efficiency budget being included in base  
24        delivery rates but reflecting NYPA exclusion

1                   from these costs.

2   Q.   Does the Panel agree the Company's proposed  
3                   electric rate design creates equitable  
4                   distribution of rates within electric SCs?

5   A.   Generally, yes. However, since the SRRP is  
6                   recommending a lower rate increase in this  
7                   proceeding, we propose rate designs to  
8                   effectuate the electric revenue requirement  
9                   presented by the SRRP.

10   Q.   What amount did the Company include for EAP  
11                   costs?

12   A.   The initial testimony of the Company's Customer  
13                   Panel states, beginning on page 23, that the  
14                   current amount reflected in base rates for the  
15                   electric EAP is \$19.721 million. The Company  
16                   states, on page 45 of the Electric Rate Panel's  
17                   initial testimony, that the proposed amount to  
18                   be reflected in base rates for EAP costs is  
19                   \$36.1 million. The Company's Electric Rate  
20                   Design Panel also proposes to include an  
21                   incremental amount of EAP costs, for collection  
22                   through rate design, that reflects the expected  
23                   additional cost of the program associated with  
24                   the Company's proposed increase in rates. The

1           estimated incremental increase in EAP costs to  
2           be collected through rate design is  
3           approximately \$51.1 million.

4   Q.    Please explain how the Company incorporated the  
5           incremental \$51.1 million in EAP costs in rate  
6           design.

7   A.    First, the Company designed rates to collect the  
8           revenue targets for each SC as determined by  
9           revenue allocation. Next, the amount of EAP  
10           costs, allocated to each SC based on revenues,  
11           is added to the revenue target, less the  
12           incremental revenue collected from the proposed  
13           minimum charge increases, and volumetric rates  
14           are designed again to collect the incremental  
15           EAP costs.

16   Q.    Does the Panel support the Company's methodology  
17           for collecting incremental EAP costs through  
18           rate design?

19   A.    No. The Customer Panel testimony, on page 25,  
20           references the current mechanism approved by the  
21           2022 Rate Order that allows the Company to defer  
22           EAP costs that exceed the rate allowance, or  
23           amount included in base rates, for future  
24           recovery. Our recommendation is to continue the

1           current deferral mechanism for EAP costs in  
2           excess of those included in base rates, and to  
3           include the entire amount of incremental EAP  
4           costs in base rates, rather than a portion in  
5           rate design.

6   Q.    What about the incremental EAP costs due to the  
7           rate increase?

8   A.    The Staff Consumer Services Panel recommends  
9           \$36.1 million be included in base rates in the  
10           RY for this program.  We acknowledge that there  
11           are incremental costs associated with the  
12           increase in rates, as stated by the Electric  
13           Rate Design Panel.  However, the magnitude of  
14           that amount depends on the increase in rates and  
15           for Staff's case, this would be less than the  
16           amount proposed by the Company of \$51.1 million,  
17           yet the exact amount is uncertain amount at this  
18           time.  We recommend that the resulting  
19           incremental EAP costs due to the increase in  
20           rates that are approved by the Commission be  
21           included in base rates as an expense, rather  
22           than included in rate design, and the current  
23           deferral mechanism be used if actual expenses  
24           exceed that amount.

1 Q. What is the ETIP Adder and NYPA Credit?

2 A. Since NYPA is excluded from paying ETIP costs,  
3 NYPA is credited the amount of these costs  
4 through the NYPA Credit. The amount of that  
5 credit is recovered from all other customers as  
6 the ETIP Adder.

7 Q. How did the Company calculate and allocate the  
8 NYPA Credit and ETIP Adder?

9 A. As described beginning on page 46 of the initial  
10 testimony of the Electric Rate Design Panel, the  
11 Company allocated ETIP costs to each demand SC  
12 and then divided those costs by the total kW for  
13 each respective demand SC. The resulting dollar  
14 per kW ETIP rate is the NYPA Credit that will be  
15 billed to NYPA customers. The ETIP Adder is the  
16 ETIP that will be credited back to NYPA  
17 customers less the ETIP that will be collected  
18 from EJP customers qualifying load. EJP  
19 customers are not exempt ETIP but their  
20 incremental load is not included in base  
21 delivery rates. Generally, the Company used  
22 forecasted kW for each SC to develop an ETIP  
23 Adder rate. This is shown in the Company's  
24 Exhibit   (E-RDP-4CU), Schedule 7.

1 Q. Did the Panel calculate the NYPA Credit and ETIP  
2 Adder with the same methodology as the Company?

3 A. Yes. See Exhibit    (SERP-4) for our NYPA Credit  
4 and ETIP Adder calculation.

5 Q. How were the proposed rates for each SC  
6 developed?

7 A. The Company proposed increases to the customer  
8 charges for each SC. Customer charges increases  
9 range between 0 percent and approximately 21  
10 percent across all SCs. The Company did not  
11 propose to change RkVA rates. The volumetric  
12 rates proposed by the Company, for both kWh or  
13 kW, were designed to recover the remaining  
14 revenue increase after considering the customer  
15 charge and RkVA revenues. These calculations  
16 are shown in the Company's Exhibit    (E-RDP-4CU, )  
17 Schedule 1.

18 Q. How did the Panel approach the design of its  
19 proposed rates?

20 A. To arrive at our minimum charge changes we used  
21 the minimum charges suggested in the Company's  
22 ECOS as a part of Exhibit    (E-RDP-3CU) , Schedule  
23 4 as a guide. For example, Exhibit    (E-RDP-  
24 3CU) , Schedule 4 calculates that the minimum

1 charge could be as high as \$27.76 for SC1, so  
2 our proposal for the minimum charge for SC1  
3 moves toward that \$27.76 while avoiding rate  
4 shock for customers. We support the Company's  
5 proposal to not update the reactive power rates,  
6 and calculate volumetric rates, either kWh or kW  
7 depending on the SC, to collect the remaining  
8 incremental revenue requirement after our  
9 minimum charge increase. A summary of our rate  
10 design can be found in Exhibit        (SERP-5) .

11 Q. Please provide an overview of SC1 Voluntary Time  
12 of Use rate design.

13 A. The SC1 Voluntary Time of Use, on peak and off  
14 peak delivery rates are created on a revenue  
15 neutral basis to the SC1 rates. The Company  
16 provided the calculation of these rates in  
17 Exhibit        (E-RDP-4CU), Schedule 5. Generally,  
18 the Company separated customer and demand  
19 related costs to design the on peak and off peak  
20 rates.

21 Q. Did the Panel calculate SC1 Voluntary Time of  
22 Use rate design with the same methodology as the  
23 Company?

24 A. Yes, our calculation of SC1 Voluntary Time of

1           Use rates can be found in Exhibit    (SERP-6) .

2   Q.    Please provide an overview of the standby  
3            delivery rates provided under SC7.

4   A.    Customers eligible for service under SC7 obtain  
5            part of their electric commodity service  
6            requirements from their own generating  
7            facilities and receive commodity service from  
8            either the Company or an ESCO when those  
9            generating facilities are not available or when  
10           the customer's load exceeds the capacity of  
11           their generating facilities. Customers without  
12           their own generation can opt in as an SC7  
13           Optional Rate Customer. Any customer can opt  
14           into SC7, except for SC12 customers,  
15           streetlighting customers, and unmetered  
16           customers.

17   Q.    Have there been any significant changes to  
18           electric standby rate design?

19   A.    Yes. The Order Establishing Updated Standby  
20           Service Rates and Implementing Optional Mass  
21           Market Demand Rate Design and Establishing  
22           Optional Demand-Based Rates, issued and  
23           effective October 13, 2023 in Case 15-E-0751,  
24           referred to as the Standby Order, included

1           several new requirements related to cost  
2           allocation for SC7 rates, as well as the Buyback  
3           Contract Demand component of the newly ordered  
4           and established SC6 delivery rates. Concerning  
5           SC7, the Standby Order established phase-in  
6           rates for the new methodology, required a summer  
7           period as-used super-peak daily demand charge,  
8           and modified residential and small commercial  
9           non-demand rates to switch from a per kWh to per  
10           kW.

11   Q.    Please describe the Company's proposed rate  
12           design for SC7 customers.

13   A.    As described beginning on page 51 of the initial  
14           testimony of the Electric Rate Design Panel, the  
15           proposed rate design for SC7 includes a customer  
16           charge, the contract demand charge, the As-Used  
17           On-peak Daily Demand Charge, and the As-Used  
18           Super-peak Daily Demand charge, consistent with  
19           the Standby Order. The Company's testimony also  
20           states the applicable dates and times for on-  
21           peak and super-peak.

22   Q.    Provide an overview of SC6 Buyback Delivery  
23           Service.

24   A.    SC6 applies to customers who have a Power

1       Purchase Agreement, or PPA, to sell the Company  
2       the output from their generating facility. As  
3       stated on page 54 of the initial testimony of  
4       the Electric Rate Design Panel, beginning July  
5       1, 2024, the customer will be required to pay  
6       the Company monthly for the use of the Company's  
7       distribution system to export power.

8   Q.   Describe the Company's proposed rate design for  
9       SC6 customers Buyback Delivery Service.

10   A.   Similar to SC7, the Company proposes to set the  
11       SC6 Customer Charge equal to the customer charge  
12       for the customer's otherwise applicable SC. The  
13       Company's Standby and Buyback rate designs can  
14       be found in Exhibit\_\_ (E-RDP-5CU) and its various  
15       schedules.

16   Q.   Is the Company's proposed rate design for SC6  
17       and SC7 consistent with the Standby Order?

18   A.   Yes.

19   Q.   Did the Panel calculate Standby and Buyback  
20       rates using the same methodology as the Company?

21   A.   Yes. The Panel's recommended Standby and  
22       Buyback rates can be found in Exhibit\_\_ (SERP-7).

23   Q.   Please describe the Residential EV Charge Smart  
24       Plan rate design.

1    A.    As described on page 13 of the Corrections and  
2        Updates filing testimony of the Electric Rate  
3        Design Panel, the Commission modified the  
4        Residential Electric Vehicle Smart Charging Plan  
5        in the Order issued on June 21, 2024 in Case 18-  
6        E-0138.   Based on that Order, customers receive  
7        the incentive monthly if they meet a monthly  
8        minimum kWh charging target and off-peak  
9        charging percentage.   The incentive is based on  
10       avoided costs and is capped at the sum of:  
11                (1) the difference between the Company's base  
12        distribution delivery rate for SC-1 customers  
13        and the SC-1 Voluntary Time of Use off-peak  
14        delivery rate; and (2) the difference between  
15        the Company's forecasted SC-1 average supply  
16        rate and the forecasted SC-1 off-peak supply  
17        rate.   These two components are multiplied by the  
18        Company's estimated average of electric vehicle  
19        home off-peak kWh charging.   The Company  
20        provided the proposed delivery and supply  
21        monthly incentives in Exhibit       (E-RDP-6CU) .

22    Q.    Did the Panel calculate Residential EV Charge  
23        Smart Plan rates, consistent with the Company's  
24        methodology?

1 A. Yes. As the Commission has approved the  
2 proposed changes to EV rates, our methodology  
3 matches the Company proposal. See  
4 Exhibit        (SERP-8) for the Panel's calculation of  
5 Residential EV Charge Smart Plan rates.

6 Q. Did the Company provide bill impacts related to  
7 its rate design proposals?

8 A. Yes, the Company provided bill impacts as a part  
9 of Exhibit        (E-RDP-4CU). The bill impacts  
10 compare the Company's proposed rates to the  
11 current rates, which have been in effect since  
12 July 1, 2024. Concerning commodity rates, the  
13 current rates use a supply forecast developed  
14 using the current Loss Factors and the proposed  
15 rates use a supply forecast developed using the  
16 proposed Loss Factors.

17 Q. Did the Panel calculate bill impacts related to  
18 their rate design proposals?

19 A. Yes, bill impacts are provided as part of  
20 Exhibit        (SERP-9). Our bill impacts compare our  
21 proposed rates to current rates, effective July  
22 1, 2024. Our bill impacts use the same  
23 commodity rates as the Company for both current  
24 and proposed rates.

1    **Revenue Decoupling Mechanism**

2    Q.    Please explain the revenue decoupling mechanism,  
3            or RDM.

4    A.    The current electric RDM reconciles actual  
5            billed delivery service revenues during the RDM  
6            reconciliation period to annual target revenues  
7            for each reconciliation group.   The RDM  
8            reconciliation groups include (1) SC1 and SC1C;  
9            (2) SC2ND; (3) SC2D; (4) SC3; (5) SC3A; and (6)  
10           Streetlighting.   The actual revenues from SC4  
11           and SC7 are included in the RDM reconciliation  
12           group of the otherwise applicable SC.

13    Q.    Is the Company proposing new RDM targets for  
14           each SC?

15    A.    Yes, the Company's RDM targets are calculated in  
16           Exhibit\_\_ (E-RDP-9CU) and correlate to the  
17           Company's proposed incremental revenue  
18           requirement and revenue allocation.

19    Q.    Does the Panel support the Company's RDM  
20           targets?

21    A.    No, the Panel recommends RDM targets based on  
22           our proposed revenue allocation and rate design.  
23           The Panel's RDM targets are calculated in  
24           Exhibit\_\_ (SERP-10).   However, we agree with the

1 continuation of the RDM under its existing  
2 terms.

3 Q. Is the Company proposing any other changes with  
4 respect to its RDM?

5 A. Yes, as stated on page 65 of the initial  
6 testimony of the Electric Rate Design Panel, the  
7 Company is adding clarification to the Electric  
8 Tariff. The proposed revisions clarify that any  
9 unreconciled balances from prior reconciliation  
10 periods may be recovered in the annual RDM  
11 reconciliation. The Company also proposed to  
12 add language to state that if a new rate plan  
13 begins prior to the end of an RDM reconciliation  
14 period, it would supersede the existing RDM  
15 adjustment with a new one, which would be  
16 established for the 12-month period of the new  
17 rate year period, based on the RDM  
18 reconciliation balance at such time of the new  
19 RDM adjustment being set.

20 Q. Does the Panel support the changes to the RDM?

21 A. Yes, the Company is entitled to the revenues  
22 associated with the previous RDM target and  
23 therefore, we support the proposed changes to  
24 the Electric Tariff concerning the RDM.

1 Q. Is the Company proposing any changes to its  
2 interim RDM adjustment?

3 A. Yes. The Electric Tariff includes a provision  
4 for an interim RDM rate which allows the Company  
5 to correct a potential revenue imbalance during  
6 a reconciliation period. The Company proposed  
7 clarifying language to make it more transparent  
8 that the interim RDM adjustment may be set using  
9 only portion of the current reconciliation  
10 balance, as opposed to the entire balance, of  
11 the applicable reconciliation group. This is  
12 the current practice used to manage customer  
13 bill impacts when determining the magnitude of  
14 an interim RDM adjustment, though it is not  
15 clearly stated in the Electric Tariff currently.

16 Q. Does the Panel support the changes to the  
17 Interim RDM Adjustment?

18 A. Yes. The Panel supports the additional  
19 transparency added to the interim RDM adjustment  
20 in the Electric Tariff.

21 **Outdoor Lighting**

22 Q. Please summarize the proposed Lighting Tariff  
23 changes.

24 A. On page 70 of the initial testimony of the

1 Company's Electric Rate Design Panel, the  
2 Company summarizes its proposed changes to the  
3 Lighting Tariff. The Company is proposing to  
4 update the rates and facility charges for  
5 Streetlighting SCs, change the effective date of  
6 the SC6 sunset clause, accelerate the SC2 Price  
7 Exemption phase-out, update the lighting service  
8 charges and outage credit allowances for SC2 and  
9 SC3, present three new facility offerings, and  
10 make various other clarifying tariff changes.

11           The Company also presents the findings of the  
12           Luminaire Replacement Cost of Service Study, or  
13           LRCSS, as directed in the 2022 Rate Order.

14 Q. How did the Company design rates for its  
15 Streetlighting SCs?

16 A. Revenue allocation to the Streetlighting SCs is  
17 shown in the Company's proposed revenue  
18 allocation in Exhibit    (E-RDP-4). Essentially,  
19 the electric ECOS Study allocates costs to the  
20 Streetlighting SCs as a whole. The Company then  
21 allocated the total streetlighting revenue  
22 requirement to each Streetlighting SC within the  
23 Lighting Tariff in proportion to the revenues at  
24 current rates as a percentage of total revenues,

1 for each SC. The Company's Streetlighting SC  
2 rate design can be found in Exhibit   (E-RDP-  
3 8CU). In addition, the Company adjusted the  
4 facility quantities used in revenue allocation  
5 and rate design to reflect the sales of  
6 streetlights to various municipalities that have  
7 occurred prior to June 30, 2024. These sales  
8 migrated the customers, and associated kWh  
9 usage, from SC2 Light to SC3 Light.

10 Q. Does the Company propose any changes related to  
11 facility pricing?

12 A. Yes, the Company proposed to increase LED  
13 facility prices at a lower percentage than the  
14 HID facility prices. As stated on page 75 of  
15 the initial testimony of the Electric Rate  
16 Design Panel, current LED luminaire prices are  
17 closer to their full replacement costs as  
18 compared to the HID lamp and luminaire prices.  
19 If the overall lighting increase is equally  
20 applied to all HID and LED facilities, the LED  
21 prices would move even closer to their  
22 replacement costs than the HID prices. Instead,  
23 the Company proposes to move the LED and HID  
24 facilities an equal percentage from their

1           current price toward their replacement costs.  
2           The differential can be seen in the price  
3           increases of SC2 Light and SC3 Light found in  
4           Exhibit    (E-RDP-8CU), Schedule 1, pages 3  
5           through 11.

6   Q.    Where can the replacement costs the Company used  
7           as a guide for this approach be found?

8   A.    They are included in the LRCSS. The Company's  
9           overall approach was to move streetlighting  
10          rates toward an equitable percentage of their  
11          associated replacement costs.

12   Q.    Does the Panel agree with this approach and,  
13          more specifically, with the Company's approach  
14          taken regarding LED and HID prices?

15   A.    Yes. Our resulting rate design is shown in  
16          Exhibit    (SERP-11). Overall, moving all  
17          streetlighting rates the entire way to the  
18          amounts included in the LRCSS would result in  
19          very high bill impacts. We recommend using the  
20          LRCSS as a guide to ensure all streetlighting  
21          rates are an equal percentage of the replacement  
22          cost.

23   Q.    Did the Panel design rates for the  
24          Streetlighting SCs with the same methodology as

1 the Company?

2 A. Yes. The Panel's streetlighting rate design can  
3 be found in Exhibit    (SERP-11).

4 Q. Please describe the Company's proposal to  
5 accelerate the elimination of Pricing Exceptions  
6 in the Lighting Tariff.

7 A. Section IV.11.2 of the Joint Proposal adopted by  
8 the 2022 Rate Order provided that SC2 Light  
9 Pricing Exceptions facility prices will be  
10 eliminated over a ten-year period ending in  
11 2031. The Company has proposed to accelerate  
12 this schedule to eliminate all SC2 Light PE by  
13 April 1, 2029.

14 Q. Why is the Company proposing to accelerate the  
15 elimination of Pricing Exceptions?

16 A. As stated on page 74 of the initial testimony of  
17 the Company's Electric Rate Design Panel, the  
18 Company describes how these Pricing Exceptions  
19 have shifted costs onto the other Streetlighting  
20 customers and the sooner they are phased out,  
21 the sooner that rates would be more equitable.  
22 There are currently six municipal customers with  
23 SC2 Light PE rates. The Company also states  
24 that administrative complexities associated with

1                   the phase out of discounts would be reduced.

2   Q.   Does the Panel support the acceleration of the  
3                   removal of Pricing Exceptions?

4   A.   No.   The Panel recommends the removal of Pricing  
5                   Exceptions over the initially agreed upon ten-  
6                   year period, through 2031, as that agreement was  
7                   reached through negotiations with multiple  
8                   parties and should be continued.   The Company  
9                   proposes this acceleration absent any change in  
10                   circumstances and therefore has not provided an  
11                   adequate reason to change the initial phase out  
12                   term, particularly when customers remain under  
13                   this SC.

14   Q.   What does the Company propose regarding the  
15                   Outage Credit Allowance?

16   A.   The existing Outage Credit Allowance provides a  
17                   credit to customers within SC1 Light, SC2 Light,  
18                   SC3 Light and SC6 Light in the event of a  
19                   service outage that is the fault of the Company,  
20                   not related to necessary system maintenance.  
21                   The Company proposes to update the Outage Credit  
22                   Allowance for SC2 Light and SC3 Light as shown  
23                   in Exhibit   (E-RDP-8CU), Schedule 3.   This  
24                   includes an increase the SC2 Light Outage Credit

1           Allowance from \$0.30 to \$0.44 per lamp per night  
2           and the SC3 Light Outage Credit Allowance from  
3           \$0.35 to \$0.48 per lamp per night. The Outage  
4           Credit Allowance is based on the prorated  
5           average charge per night for each HID and LED  
6           offering. In addition, the Company proposed to  
7           eliminate the SC6 Light Outage Credit Allowance  
8           in conjunction with the proposed sunset date for  
9           the SC6 service class itself, which the Company  
10          proposes to move forward from June 30, 2025 to  
11          March 31, 2025 to align with the start of the  
12          RY.

13    Q.    Does the Panel support the Company's methodology  
14          for calculating the Outage Credit Allowances?

15    A.    Yes. However, using the SRRP's recommended  
16          revenue requirement, our recommended Outage  
17          Credit Allowances for SC2 Light and SC3 Light  
18          are \$0.38 and \$0.43 per lamp per night  
19          respectively as shown in Exhibit    (SERP-12) .

20    Q.    Does the Panel support the Company's proposed  
21          sunset date for S6 Light?

22    A.    Yes.

23    Q.    What costs do the Lighting Service Charges  
24          recover?

1    A.    As described beginning on page 76 of the initial  
2    testimony of the Electric Rate Design Panel, the  
3    Lighting Service Charges are designed to recover  
4    the costs associated with customer-requested  
5    services that are beyond the standard  
6    facilities.   Under existing rates, the Company  
7    charges a single rate for SC2 Light customers  
8    and separate overhead, underground, and  
9    emergency service charges for SC3 Light  
10   customers.   The calculation of these rates is  
11   based on crew composition, vehicles, impressed  
12   stock materials, regional logistics used by  
13   Operations, and the type of street light energy  
14   source.

15   Q.    Is the Company proposing any changes to the  
16   Lighting Service Charges?

17   A.    The Company is not proposing any changes to the  
18   calculation of the Lighting Service Charges,  
19   however, the Company is proposing to calculate  
20   specific SC3 Light Lighting Service Charges for  
21   each of the Rate Year and the Data Years as  
22   opposed to having a constant rate for the  
23   duration of a multi-year rate plan.   The  
24   Company's proposed rates are shown in

1                   Exhibit    (E-RDP-8CU), Schedule 4.

2   Q.   Does the Panel have any recommendations  
3                   regarding the Lighting Service Charges?

4   A.   While the Panel does not take a position on  
5                   specific rates outside of the initial Rate Year,  
6                   we support the concept generally of calculating  
7                   new SC3 Light Lighting Service Charges for each  
8                   subsequent year in a potential multi-year rate  
9                   plan as that is consistent with what is  
10                  currently done for SC2 Light Lighting Service  
11                  Charges. We also recommend that the calculation  
12                  be updated for the approved or agreed upon  
13                  inflation factors in this proceeding.

14   Q.   Is the Company proposing to add any new lighting  
15                  facility offerings?

16   A.   According to page 78 of the initial testimony of  
17                  the Electric Rate Design Panel, the Company is  
18                  proposing several new lighting facility  
19                  offerings. First, to add four underpass LED  
20                  luminaires to replace the existing HID underpass  
21                  luminaires. Second, to add four 3000K  
22                  correlated color temperature roadway luminaires.  
23                  Third, the Company is proposing an alternatively  
24                  sourced convenience outlet device referred to as

1           a Power Tap.

2   Q.    Why is the Company proposing to offer underpass  
3           LED luminaires?

4   A.    As stated on page 79 of the initial testimony of  
5           the Electric Rate Design Panel the Company  
6           currently has HID luminaires that are becoming  
7           too expensive; supply of the luminaires is  
8           decreasing as manufacturers end HID luminaire  
9           production and there is a resulting impact in  
10           price. The Company is proposing new underpass  
11           LED luminaires to replace existing HID  
12           luminaires.

13   Q.    How did the Company develop the rates for the  
14           new underpass LED luminaires?

15   A.    The Company utilized the LRCSS, which summarizes  
16           the cost to install and maintain the LED  
17           luminaires based on current material, labor, and  
18           transportation costs, as well as appropriate  
19           burden and carrying charges. The existing HID  
20           underpass luminaires rates are lower than their  
21           respective replacement cost, so the Company used  
22           an HID price-to-cost factor to apply a similar  
23           ratioed discount to the new underpass LED rates.

24   Q.    What carrying charges did the Company use in the

1 development of the underpass LED luminaries  
2 rates?

3 A. As stated on page 80 of the initial testimony of  
4 the Electric Rate Design Panel, the Company  
5 included the weighted average cost of capital,  
6 or WACC, rate effective through the current rate  
7 year, ending June 30, 2023, estimated property  
8 tax, and specific depreciation rates by  
9 luminaire type in the calculation of the  
10 carrying charges of installation costs. The  
11 underpass LED cost of service and rate design is  
12 presented in Exhibit        (E-RDP-8), Schedule 5.1.

13 Q. Does the Panel recommend any changes to  
14 Company's proposed rate design for these new  
15 underpass LED luminaries rates?

16 A. No.

17 Q. What are the cost impacts to a customer that  
18 wishes to convert existing underpass HID to the  
19 new underpass LED luminaires?

20 A. As stated on page 81 of the initial testimony of  
21 the Electric Rate Design Panel, the new  
22 underpass LED luminaires rates result in a  
23 facility rate reduction and a total bill  
24 reduction due to the reduced energy consumption

1                   associated with LED luminaires.

2   Q.    Why is the Company proposing the Power Tap?

3   A.    According to the Company, on page 82 of the  
4                   initial testimony of the Electric Rate Panel,  
5                   the existing outlet assemblies were intended for  
6                   uses such as seasonal events or decorations.

7                   The existing convenience outlet is energized via  
8                   a tap to the Company's secondary distribution.

9                   In contrast, the Power Tap device is energized  
10                  directly through the luminaire. The Power Tap  
11                  is intended to accommodate "smart city" devices  
12                  and allow more flexibility for mixed ownership  
13                  of assets between the Company and customer.

14   Q.    How were the rates for the Power Tap developed?

15   A.    The Company proposed Power Tap rate is \$62.64  
16                  per year and was developed utilizing the cost of  
17                  service methodology used in the LRCSS and the  
18                  underpass LED rate development and is shown in  
19                  Exhibit   (E-RDP-8), Schedule 5.2.

20   Q.    Does the Panel have any modifications to the  
21                  Power Tap rate design?

22   A.    No.

23   **Other Lighting Tariff Changes**

24   Q.    Is the Company proposing any other changes to

1                   the Lighting Tariff?

2   A.   Yes.  The Company is proposing both housekeeping  
3        changes and substantive revisions related to  
4        backbilling rules and provisions, attachments,  
5        and missing surcharge language.

6   Q.   Please explain the Company's changes to the  
7        abbreviations and definitions section of the  
8        Lighting Tariff.

9   A.   As listed on pages 94 and 95 of the initial  
10       testimony of the Electric Rate Design Panel, the  
11       Company is proposing to add several  
12       abbreviations and definitions to its Lighting  
13       Tariff.

14   Q.   Does the Panel support the changes to the  
15       abbreviations and definitions section of the  
16       Lighting Tariff?

17   A.   Yes.  The changes make the Lighting Tariff  
18       clearer by adding definitions of terms used  
19       throughout.

20   Q.   What changes is the Company proposing for the  
21       General Information section?

22   A.   The Company is proposing multiple revisions  
23       including (1) removing references to SC6 Light  
24       to align with the proposed sunset date of

1                   March 31, 2025; (2) add various surcharges that  
2                   were not included in the Lighting Tariff that  
3                   were added to the Electric Tariff; (3) revisions  
4                   to clarify the appropriate application of the  
5                   Company's undergrounding rule and termination of  
6                   lighting facilities; (4) revisions to specify  
7                   the difference in billing for SC3 Light as  
8                   compared to SC1 Light and SC2 Light; (5) add a  
9                   minimum period of one year for adaptive hours of  
10                  operation under SC3 Light; (6) adding a new  
11                  process for attachments to Company facilities;  
12                  and (7) revisions to allow customers to request  
13                  luminaire operating performance criteria from  
14                  the Company.

15   Q.    Do you support these proposed changes to the  
16                  General Information section of the Lighting  
17                  Tariff?

18   A.    Yes. These proposed changes do not materially  
19                  change the provision of service; rather, they  
20                  improve consistency with the Electric Tariff  
21                  and/or clarifying existing terms and conditions  
22                  in the Lighting Tariff.

23   Q.    What changes is the Company proposing to make to  
24                  the SC1 Light SC?

1 A. On page 96 of the initial testimony of the  
2 Electric Rate Design Panel, the Company proposes  
3 changes to the SC1 Light section of the Lighting  
4 Tariff to update facility classifications for  
5 items that have been removed from stock, as well  
6 as providing information on where current  
7 billing account and inventory information is  
8 located on the Company's website.

9 Q. Does the Panel support these changes to SC1  
10 Light?

11 A. Yes, the Panel supports increasing clarity on  
12 availability of facilities and billing account  
13 information.

14 Q. Is the Company proposing any facility  
15 classification changes to SC1 Light?

16 A. Yes, the Company is moving multiple Lamp and  
17 Luminaires, listed on page 97 of the initial  
18 testimony of the Electric Rate Design Panel in  
19 Table 3, from Closed to Obsolete because the  
20 Company no longer provides new installations or  
21 in-kind replacement for these facilities and no  
22 longer provides maintenance service. There are  
23 currently 17 customers with these facilities,  
24 representing 189 total lamps or luminaires.

1 Q. Does the Panel support the Company's tariff  
2 changes to SC1 Light facilities?

3 A. Yes, as the Company is no longer offering these  
4 facilities they should be moved from closed to  
5 obsolete.

6 Q. What changes is the Company proposing to make to  
7 the SC2 Light SC?

8 A. As stated on pages 98 and 99 of the initial  
9 testimony of the Electric Rate Design Panel, the  
10 Company is proposing several revisions to SC2  
11 Light. First, the Company added language to  
12 allow discretion to serve existing customers  
13 under SC2 Light that have extenuating  
14 circumstances. Second, the Company updated for  
15 changed classifications, eliminated lamps and  
16 pricing exemptions. Finally, the Company added  
17 its proposed new 3000K roadway luminaires,  
18 underpass LED luminaires and Power Tap.

19 Q. Does the Panel support those proposed SC2 Light  
20 tariff changes?

21 A. Yes. We support the addition of the 3000K  
22 roadway luminaires, underpass LED luminaires,  
23 and Power Tap, as stated previously in our  
24 testimony. In addition, we support the addition

1           of the corresponding tariff language to update  
2           SC2 Light to currently available facilities.

3   Q.   Did the Company propose to remove any facilities  
4           from SC2 Light?

5   A.   Yes, the Company removed multiple facilities  
6           from its tariff, as listed on page 99 of the  
7           initial testimony of the Electric Rate Design  
8           Panel in Table 4. The Company states these  
9           facilities are no longer in service and the  
10           tariff should be updated to reflect that.

11   Q.   Does the Panel support the Company's tariff  
12           changes to SC2 Light facilities?

13   A.   Yes, as the Company no longer offers these  
14           facilities, they should be removed from the  
15           tariff.

16   Q.   Are there any facilities the Company removed  
17           from SC2 pricing exception?

18   A.   Yes. As stated on page 100 of the initial  
19           testimony of the Electric Rate Design Panel, the  
20           Village of Kinderhook replaced the sixteen  
21           incandescent luminaries under this price  
22           exception. Therefore, the Company proposed to  
23           remove the price exception from the Lighting  
24           Tariff.

1 Q. Does the Panel support the removal of the  
2 Kinderhook luminaires?

3 A. Yes, as this pricing exception no longer  
4 applies, it should be removed from the Electric  
5 Tariff.

6 Q. Are there any facilities the Company moved  
7 within the SC2 Light tariff?

8 A. Yes, the Company moved multiple facilities  
9 listed in Table 5 on page 101 of the Electric  
10 Rate Design Panel from Standard to Closed. The  
11 Company states these offerings will be replaced  
12 by new LED offerings.

13 Q. Does the Panel support moving these facilities  
14 from Standard to Closed?

15 A. Yes, the Panel supports the replacement of HID  
16 luminaires with LED luminaires, so we support  
17 closing HID offerings that have LED equivalents.

18 Q. What changes is the Company proposing to make to  
19 SC3 Light?

20 A. The changes are listed beginning on page 101 of  
21 the initial testimony of the Electric Rate  
22 Design Panel. The Company proposes multiple  
23 changes to SC3 Light. First, the Company  
24 proposes to add language to state the Company

1       has no obligation to purchase any customer-owned  
2       street light system. Second, the Company  
3       proposes a minor correction and added clarifying  
4       language regarding adaptive scheduling. Third,  
5       the Company proposes additional language to  
6       clarify the billing and servicing of  
7       supplemental attachments. Finally, the Company  
8       proposes a minor change to eliminate unnecessary  
9       information.

10   Q.   Does the Panel support these changes to SC3  
11   Light?

12   A.   Yes. Regarding the proposed change to state  
13   that the Company has no obligation to purchase  
14   any customer-owned street light system, we note  
15   that the purchase of customer-owned  
16   streetlighting facilities is not required for a  
17   customer to take service under SC3 Light.

18   Q.   What changes is the Company proposing to SC6  
19   Light?

20   A.   The Company is proposing to change the effective  
21   date of the sunset of SC6 Light to March 31,  
22   2025 to make the sunset date effective prior to  
23   the beginning of the RY. Page 102 of the  
24   initial testimony of the Company's Electric

1 Rates Panel states that the unmetered electric  
2 lighting service under SC6 Light has been closed  
3 to new applicants since February 1, 2011. The  
4 2022 Rate Order adopted a sunset date of June  
5 30, 2025 for SC6 Light. The Company has  
6 continued to provide service under this SC to  
7 existing customers and currently serves six  
8 customers under SC6 Light. The Company states  
9 that once SC6 is eliminated, these six customers  
10 will transition to SC3 Light.

11 Q. Does the Panel support the new sunset date?

12 A. Yes. Moving the sunset date forward a few  
13 months will not negatively impact these six  
14 customers and will better align with the start  
15 of the RY. However, we recommend a sunset date  
16 of April 30, 2025 as, due to the Company's  
17 filing date and maximum suspension period of the  
18 proposed tariff leaves, the RY tariff would  
19 likely not become effective until May 1, 2025 at  
20 the earliest. We also recommend that the  
21 Company provide notice directly to each customer  
22 impacted to communicate the change in SC.

23

24

1    **Electric Tariff Revisions Associated with Outdoor**2    **Lighting**

3    Q.    Is the Company proposing any changes to the  
4        Electric Tariff that affects Outdoor Lighting?

5    A.    Yes, the Company is proposing to change Rule 32  
6        in the Electric Tariff to add a subpart to  
7        32.2.1, the calculation of charges for municipal  
8        undergrounding, to exclude overhead lighting  
9        facilities.

10   Q.    Why is the Company proposing this change in Rule  
11        32?

12   A.    As stated on page 103 and 104 of the initial  
13        testimony of the Company's Electric Rate Design  
14        Panel, the proposed revision seeks to clarify  
15        this calculation to make it clearer that  
16        components related to the permanent  
17        discontinuation of overhead lighting facilities  
18        should be excluded.

19   Q.    Does the Panel support the change to Rule 32?

20   A.    Yes. It is not clear from Rule 32 as currently  
21        written that this calculation should exclude  
22        overhead lighting facilities, therefore the  
23        Panel supports this proposed revision.

24

## 1 Changes to Tariff Fees, Charges, and Provisions

2 Q. Please describe the Company's proposed  
3 Electrification Rate Rebate.

4 A. As described in the Company's CLCPA Panel,  
5 beginning on page 37, the Company is proposing a  
6 new Non-Pipes Alternative, or NPA, Heat Pump  
7 Monthly Bill Credit Program. The Company  
8 proposes revisions to its Electric Tariff to add  
9 language associated with the credit to Rule 70  
10 and the Company proposes cost recovery of the  
11 credit through the RDM.

12 Q. Does the Panel support the proposed tariff  
13 revisions associated with implementing the NPA  
14 Heat Pump Monthly Bill Credit Program?

15 A. Yes, but with two recommendations. First, the  
16 tariff revisions should allow the Company to  
17 implement the program as recommended by the  
18 Staff Energy Sustainability Panel, or SESP.  
19 Second, we recommend that the recovery of the  
20 costs associated with this program be done via a  
21 separate surcharge, not through the RDM as  
22 proposed by the Company. Recovering via a  
23 surcharge will allow for more transparency to  
24 customers and reduce the magnitude of the RDM

1 reconciliation rate.

2 Q. What are AMR/AMI Opt-Out Fees?

3 A. Customers who do not wish to have an AMR/AMI  
4 meter installed at their premises have an option  
5 to opt out and have their AMR/AMI meter replaced  
6 with a non-AMR meter. Customers who opt out are  
7 charged a one-time removal fee of their existing  
8 meter as well as an ongoing monthly meter  
9 reading fee for the new non-AMR/AMI meter.

10 Q. Is the Company proposing to change the AMR/AMI  
11 Opt Out Fees?

12 A. Yes. The proposed fees are listed on Page 106  
13 of the initial testimony of the Company's  
14 Electric Rate Design Panel. The proposed fees  
15 specified above are calculated as provided in  
16 Exhibit (E-RDP-11), Schedule 5.

17 Q. Does the Panel support the calculation of the  
18 AMR/AMI Opt Out fees?

19 A. Yes. The fees remain consistent with the terms  
20 of the tariff and are updated for more recent  
21 expenses, therefore they are reasonable.

22 Q. What are Re-Establishment Fees?

23 A. The Company charges a fee to customers when the  
24 Company re-establishes electric service to the

1                   same customer at the same meter location where  
2                   the service was disconnected for non-payment of  
3                   bills.

4   Q.    Is the Company proposing to change Re-  
5                   Establishment Fees?

6   A.    Yes. The Company's proposed changes to re-  
7                   establishment fees are listed on page 107 of the  
8                   initial testimony of the Company's Electric Rate  
9                   Design Panel. The proposed fees are calculated  
10                  in Exhibit   (E-RDP-11), Schedule 1, page 1.  
11                  According to the Company, it filed a petition  
12                  for a five-dollar fee that recovers costs  
13                  associated with remotely connecting or  
14                  reconnecting or disconnecting a customer's  
15                  electric AMI meter, once such functionality  
16                  becomes available. The petition remains pending  
17                  before the Commission.

18   Q.    Does the Panel support the Company's calculation  
19                  of re-establishment fees?

20   A.    Yes, the Panel has no updates to the Company's  
21                  re-establishment Fees. However, the Panel  
22                  recommends that the five-dollar proposed fee  
23                  currently pending before the Commission not be  
24                  reflected in the Electric Tariff until

1                   Commission action on the pending petition.

2   Q.    Is the Company proposing to change Competitive  
3                   Billing Charges?

4   A.    Yes. The Company's proposed calculation of the  
5                   ESCO Billing Charge and the Customer Backout  
6                   Credit is shown in Exhibit    (E-RDP-11CU) ,  
7                   Schedule 3. For electric only customers the  
8                   proposed rate would increase \$0.17 to \$0.92 per  
9                   bill. For customers who receive gas and  
10                   electric service from the Company, the proposed  
11                   rate would increase \$0.05 to \$0.46 per bill.

12   Q.    Did the Panel calculate its own Competitive  
13                   Billing Charges?

14   A.    Yes. Based on our forecasted customer bills  
15                   provided by the SFP and the inflation factor  
16                   provided by the Staff Witness Gadomski, our  
17                   recommended charge and credit for an electric  
18                   only customer is \$0.46 and for a dual electric  
19                   and gas customer our recommended charge and  
20                   credit is \$0.92.

21   Q.    What is the paperless billing credit?

22   A.    The paperless billing credit is a credit to  
23                   customers who do not receive a physical bill.

24   Q.    Does the Company propose to update its Paperless

1                    Billing Credit?

2    A.    Yes. The Company is proposing to update the  
3                    Paperless Billing Credit \$0.41 to \$0.60 as shown  
4                    in Exhibit    (E-RDP-11CU), Schedule 2, Page 1.

5    Q.    Does the Panel agree with this rate?

6    A.    Yes. We updated the calculation for the  
7                    inflation factor provided by the Staff Witness  
8                    Gadomski and it resulted in the same \$0.60  
9                    paperless billing credit.

10   Q.    Is the Company proposing to update the monthly  
11                    incremental customer charge for customers that  
12                    participate in the demand response programs,  
13                    specifically the Emergency Demand Response  
14                    Program, Day Ahead Demand Response Program,  
15                    Commercial System Relief Program, Distribution  
16                    Load Relief Program, and Term and Auto Term DLM  
17                    Program?

18   A.    Yes, the Company is proposing to update this  
19                    rate from \$11.77 to \$14.56 per month. The  
20                    Company's calculation is shown in Exhibit    (E-  
21                    RDP-11), Schedule 4.1.

22   Q.    Does the Panel support the Company's updated  
23                    incremental customer charge associated with  
24                    costs for customers enrolled in the Company's

1 demand response programs?

2 A. Yes.

3 Q. Is the Company proposing to update the  
4 incremental customer charge for Special  
5 Provision L of SC1 and Special Provision O of  
6 SC2ND?

7 A. Yes. The Company proposed updated incremental  
8 customer charges associated with Special  
9 Provision L of SC1 and Special Provision O of  
10 SC2ND in Exhibit    (E-RDP-11CU), Schedule 4.2.  
11 The Company proposed to increase the rate from  
12 \$3.11 to \$5.15.

13 Q. Does the Panel agree with this proposed rate?

14 A. No. The Panel recommends a rate of \$4.41, for  
15 the incremental customer charges associated with  
16 Special Provision L of SC1 and Special Provision  
17 O of SC2ND as shown in Exhibit    (SERP-13). Our  
18 recommended rate was calculated using the same  
19 methodology as the Company but using the Return  
20 on Equity, or ROE, Debt Cost, Equity Percent,  
21 Debt Percent, Inflation Rate, and Pre-tax WACC  
22 recommended by Staff Witness Duah and Staff  
23 Witness Gadomski's testimonies.

24 Q. Is the Company proposing to update the

1           incremental customer charge for Special  
2           Provision P of SC2D, Special Provision L of SC3,  
3           and Special Provision N of SC3?

4   A.   Yes. The Company proposed updated incremental  
5           customer charges for Special Provision P of  
6           SC2D, Special Provision L of SC3, and Special  
7           Provision N of SC3, which are shown in  
8           Exhibit   (E-RDP-11CU), Schedule 4.3. The  
9           current rate is \$24.71 and the Company proposed  
10           rate is \$27.15.

11   Q.   Do you agree with this proposed rate?

12   A.   No. The Panel recommends a rate of \$24.90 for  
13           incremental customer charges associated with  
14           Special Provision P of SC2D, Special Provision L  
15           of SC3 and Special Provision N of SC3 as shown  
16           in Exhibit   (SERP-14). To calculate our  
17           recommended rate we used the same methodology as  
18           the Company but with the Return on Equity, or  
19           ROE, Debt Cost, Equity Percent, Debt Percent,  
20           Inflation Rate, and Pre-tax WACC recommended by  
21           Staff Witness Duah and Staff Witness Gadomski's  
22           testimonies.

23   Q.   What is the Company's proposal concerning the  
24           Other Delivery Surcharge?

1    A.    Beginning on page 115 of the initial testimony  
2       of the Electric Rate Design Panel, the Company  
3       discusses its proposal to move certain  
4       surcharges into a new bill line item, called  
5       Other Delivery Surcharges, or ODS. These  
6       surcharges include the DLM surcharge, the VDER  
7       surcharge, the EAM surcharge, the EV Make Ready  
8       surcharge, the Arrears Management Program Phases  
9       1 and 2 Surcharges, the Reliability Support  
10      Services surcharge, the Non-Wires Alternative  
11      Surcharge and the proposed RAM surcharge.

12    Q.    Why does the Company propose this change?

13    A.    The Company claims that including all of these  
14      surcharges in a separate ODS line item on a  
15      customer bill will ease customer confusion and  
16      increase transparency. An example ODS statement  
17      is shown in Exhibit (E-RDP-13), Schedule 1.

18    Q.    Does the Panel agree with the proposed ODS?

19    A.    Yes, however we support the recommendations  
20      regarding the ODS made by the Staff Consumer  
21      Services Panel.

22    Q.    Does the Company propose any changes to the  
23      current Late Payment Charges and Other Waived  
24      Fees surcharge mechanism?

1    A.    Yes. The Company proposes to eliminate the Late  
2    Payment Charges and Other Waived Fees, or LPCO,  
3    effective July 1, 2025. The Company states,  
4    beginning on page 117 of the Electric Rate  
5    Design Panel testimony, that the final  
6    collection period for the deferred unbilled  
7    fees, net of savings, ends on June 30, 2025.  
8    The Company proposes to continue to accrue  
9    carrying charges at the pre-tax WACC on any  
10   remaining deferral balance through June 30,  
11   2025.

12   Q.    Does the Panel support the Company's proposal  
13   regarding the LPCO surcharge mechanism?

14   A.    Yes, given that the collection period ends on  
15   June 30, 2025, the Panel finds it appropriate to  
16   eliminate the surcharge on July 1, 2025.

17   Q.    Does the Company propose any modifications to  
18   the Net Utility Plant, or NUP, Surcharge?

19   A.    Yes. As stated on page 118 of the initial  
20   testimony of the Electric Rate Design Panel, the  
21   Company is proposing to eliminate the NUP  
22   surcharge effective April 1, 2025, or the start  
23   of the RY.

24   Q.    Does the Panel support the elimination of the

1                   NUP?

2   A.    Yes.  The NUP was designed to allow the Company  
3                   to recover revenue requirement associated with  
4                   net plant at the end of its previous rate plan.  
5                   Therefore, there is no future need for the NUP.

6   Q.    Does the Company propose any modifications to  
7                   the Hydrogen Energy Transfer System, or ETS,  
8                   Surcharge?

9   A.    Yes.  The pilot project has been cancelled by  
10                  the Company and as such, on page 118 of the  
11                  Electric Rate Design Panel testimony, the  
12                  Company proposes to eliminate the surcharge from  
13                  the Electric Tariff.

14   Q.    Does the Panel support the removal of the  
15                  Hydrogen ETS surcharge from the Electric Tariff?

16   A.    Yes.

17   Q.    Why is the Company proposing to remove  
18                  references to the EZR from the Electric Tariff?

19   A.    As stated on page 119 of the initial testimony  
20                  of the Electric Rate Design Panel, the Company  
21                  states that the Economic Development Zone  
22                  Program is fully closed at this time and there  
23                  are no customers still receiving service under  
24                  the EZR.

1 Q. How does the elimination of EZR impact the  
2 Electric Tariff?

3 A. The Company states that Form I of the Electric  
4 Tariff, the agreement for customers receiving  
5 discounted electric service under SC12, has a  
6 minimum bill provision that references the EZR  
7 rate. The Company proposes to modify this  
8 provision to reference the EJP rate. Both EZR  
9 and EJP rates are based on the Company's  
10 marginal costs.

11 Q. Does the Panel support this proposal?

12 A. Yes. As the EZR and EJP rates are both based on  
13 the Company's marginal costs, it is reasonable  
14 to modify form I from EZR rates to EJP rates.

15 Q. Is the Company proposing any changes regarding  
16 EJP customers?

17 A. The Company explains, on page 120 of the initial  
18 testimony of the Electric Rate Design Panel,  
19 that the Order Approving Tariff Amendments,  
20 issued January 21, 2021 in Case 18-E-0130,  
21 referred to as the 2018 Order, directed the  
22 Company to fix an inconsistency regarding  
23 exemptions from energy storage cost recovery for  
24 EZR and EJP delivery loads and propose a

1                   solution to fix this issue. EZR and EJP  
2                   customers are exempt from energy storage costs  
3                   and should therefore be exempt from the Energy  
4                   Storage Surcharge. The Company notes that the  
5                   EZR issue is resolved with the elimination of  
6                   that program and proposes tariff revisions to  
7                   exempt EJP from the Energy Storage Surcharge.

8   Q.   Does the Panel support the Company's proposal  
9                   related to EJP customers?

10   A.   Yes. This proposal is consistent with 2018  
11                   Order.

12   Q.   Is the Company proposing any changes to how the  
13                   Standardized Interconnection Requirements, or  
14                   SIR, are described in the Electric Tariff?

15   A.   Yes, as stated on page 121 of the initial  
16                   testimony of the Electric Rate Design Panel the  
17                   Company proposes a number of changes to correct  
18                   title and references.

19   Q.   Does the Panel support these changes?

20   A.   Yes, the changes are to correct inconsistencies  
21                   and they should be adopted.

22   Q.   Is the Company proposing modifications to SC7 in  
23                   the Electric Tariff?

24   A.   Yes, as stated on page 122 of the initial

1           testimony of the Electric Rate Design Panel, the  
2           Company proposes a modification to the  
3           definition of on-site generation that is subject  
4           to SC7 delivery rates to exclude energy storage  
5           systems. The Company claims that energy storage  
6           that exports energy to the distribution system  
7           is subject to SC7 rates for their charging  
8           usage, unless such exports are sold in the  
9           wholesale market.

10   Q.    Does the Panel support the Company's  
11           modification to the definition of on-site  
12           generation?

13   A.    Yes.

14   Q.    Is the Company proposing any changes to its  
15           tariff language regarding Clean Energy Standard  
16           Delivery?

17   A.    As explained on pages 122 and 123 of the initial  
18           testimony of the Electric Rate Design Panel, the  
19           Company is proposing two changes. First,  
20           modification to rule 46.5.1.2 to show a filing  
21           deadline for Clean Energy Standard Delivery, or  
22           CESD, of three business days prior to the  
23           effective date. In addition, the Company  
24           proposes modifications to rule 46.5.1.4 to

1           include the recovery of uncollectible costs in  
2           the calculation of the CESD. The Company states  
3           this change was approved by the Commission's  
4           February 22, 2017 Order in Case 15-E-0302.

5   Q.    Does the Panel support the tariff changes  
6           related to the CESD rule 46?

7   A.    Yes.

8   Q    Is the Company proposing any changes to its  
9           Electric Tariff regarding rule 42?

10   A.   As stated on 123 of the initial testimony of the  
11           Electric Rate Design Panel, the Company proposes  
12           modifications to clarify that capacity charges  
13           should be included in both the Uncollectible  
14           Percentage Factor and Working Capital on  
15           Purchased Power Rates supply cost components of  
16           the MFC.

17   Q.    Does the Panel support the tariff changes  
18           pertaining to Rule 42 of the MFC?

19   A.    Yes, the changes are clarifying in nature and  
20           should be approved.

21   Q.    Please explain the Company's proposal related to  
22           acceptable forms of payment.

23   A.    The Company is proposing to list several  
24           acceptable payment methods in its tariff, as

1           well as directing customers to the Company's  
2           website for a full list of accepted forms of  
3           payment. The Company is proposing this change  
4           in response to an increased volume of inquiries  
5           from customers regarding acceptable payment  
6           methods.

7   Q.    Does the Panel support the Company's proposal  
8           related to acceptable forms of payment?

9   A.    Yes.

10   Q.    Are there any additional tariff changes proposed  
11           by the Company?

12   A.    Yes. On pages 124 and 125 of the Company's  
13           Electric Rate Design Panel testimony, the  
14           Company proposes to clarify language on Leaf 354  
15           pertaining to religious organizations  
16           eligibility for SC1 service.

17   Q.    Does the Panel support the Company's proposed  
18           tariff modifications pertaining to SC1  
19           eligibility for religious organizations?

20   A.    Yes.

21   Q.    Does the Company have any additional changes to  
22           its tariff?

23   A.    Yes, the Company is correcting the Electric  
24           Tariff Leaf 427.1 to reflect that the As-Used

1           Super-Peak Daily Demand is measured during the  
2           super-peak hours.

3   Q.    Does the Panel support this correction?

4   A.    Yes, as the change is clarifying in nature we  
5           recommend it is approved.

6   Q.    Does this conclude the Panel's testimony at this  
7           time?

8   A.    Yes.
