PSEG Long Island
Case Name: PSEG LI - Rate Case 2015
Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-TDP-0110
Date of Response: 03/05/2015
Witness: TD BUDGET AND OPERATIONS

Question:

Provide the following including any work papers as needed:
Vegetation management cycle length.

Attachments Provided Herewith: 1

DPS-TDP_0110_ECI Report LIPA Vegetation_8-4-13.pdf

Response:

Historically, LIPA typically funded a 200 miles per year vegetation management cycle of the approximately 1,000 overhead transmission circuit miles. PSEG-LI's Vegetation Management strategy was to bring the transmission system onto a four year cycle, i.e., to trim 250 miles per year. The four-year transmission trim cycle adopted by PSEG-LI (starting in 2014 and going forward) was intended to align the transmission Vegetation Management program with industry best practices. Please see PSEG LI's response to Data Request DPS-TDP-175 for further support for the four-year cycle.

Comparative Assessment of LIPA's Vegetation Management Program

1. Executive Summary

This report is a result of National Grid Electric Services, LLC (National Grid) request for a review and comparative industry assessment of LIPA's current transmission and distribution vegetation management (VM) methods, practices, strategies and procedures with that of other similar utilities.

This report contains ECI's findings regarding the specific scope of service requested. ECI's method for completing this report include: (1) a thorough review of LIPA's current vegetation management program via data request, field review and staff interviews, (2) use of ECI proprietary vegetation data and reports regarding vegetation management on the LIPA system, (3) a comparison to other utilities using proprietary data ECI has from assessments and benchmark studies of other utilities, and (4) the experience and knowledge of ECI's expert team about common utility vegetation management practices, methods, strategies and procedures in use nationally and in the northeast gained through 40 years of experience in conducting vegetation assessments of over 170 utilities as well as ECI's extensive database of utility vegetation management programs.

There were 22 comparative items reviewed for this report. LIPA fell within industry standard practices on eight items, was outside industry common practices on seven items, marginally outside industry norm on six items and one category (NERC) was not applicable. The six items where LIPA was marginally outside industry norm were use of herbicide on vine mitigation, lack of defined storm hardening tree selection procedure, work force management (Regional LCS clerical duties), management of customer refusals and methodology for designating pruning cycles and selecting circuits each year for preventative maintenance. . LIPA currently does not have to meet NERC standards, but, in the future may come under these standards as NERC standards change. LIPA has acceptable herbicide specifications; however, there is minimal use of herbicides as a VM tool beyond fee owned property.

Some of the areas where LIPA is outside industry standards include:

- Specified distribution clearance less than industry norm,
- Lack of defined maintenance cycle and no "back-up" cycle length established,
- Lack of comprehensive customer refusal tracking program,
- Lack of a VM management system that is capable of tracking cost, production, refusals, and delivering periodic management progress summaries and one that provides valuable, timely and detailed information regarding the VM program and one that aids the field staff and does not create a burden to them for data entry,
- Increase in planned outages for line clearance crews and to accommodate customer tree removal requests,
- Lack of a strong outreach program that proactively promotes the VM program,
- Insufficient focus of the storm hardening program to achieve desired results,

- A contracting strategy not in alignment with how the work is actually accomplished and paid for.

A comparison of cost and reliability to a group of similar utilities indicated that LIPA has lower VM program cost and compares favorably with other utilities regarding reliability. A summary matrix is provided in the Reference Section (4.1) to compare LIPA to similar utilities in meeting industry Best Management Practices (BMP's) with regard to vegetation management.

While transmission VM is a small part of LIPA's budget, transmission VM can have a significant impact on system reliability, customer satisfaction and meeting regulatory requirements. Therefore, ECI included an extensive historical review of LIPA's transmission VM program and analysis of current practices as well as a look to future trends. LIPA has exceptionally narrow easements compared to the industry. Through intensive management, LIPA has achieved improvements in transmission reliability through what can be categorized as a planned, systematic flexible maintenance cycle based on ROW conditions via inspections twice per year, reliability and last maintenance date. While LIPA currently does not fall under the regulatory umbrella of NERC or NYPSC, this may be changing in the future as NERC lowers the voltage requirements from 200kV to 100 kV and the NYPSC incorporates LIPA under their regulatory requirements regarding transmission VM. In anticipation of these potential changes, LIPA has been moving to 25' of clearance on 138kV transmission lines on a case by case basis.

2. INTRODUCTION

This report is in response to a request from National Grid Electric Services, LLC (National Grid) to conduct a comparative assessment of Long Island Power Authority (LIPA's) vegetation management (VM) program with that of other similar utilities. ECI will rely on our 40 years of experience in conducting vegetation assessments of over 170 utilities, our extensive database of utility vegetation management programs and the extensive experience of ECI experts assigned to complete this project.

ECI's approach to accomplishing the specific scope of service requested, includes: (1) a thorough review of LIPA's current VM program via staff interviews, (2) use of ECI proprietary vegetation data and reports regarding vegetation management on the LIPA system, (3) a comparison to other utilities using proprietary data ECI has from assessments and benchmark studies of other utilities, and (4) the experience and knowledge of ECI's expert team about common utility VM practices, methods, strategies and procedures in use nationally and in the northeast.

LIPA is a corporate municipal instrument and a political subdivision of the State of New York. LIPA began operating in 1998 as a non-profit municipal electric provider owning the retail electric transmission and distribution system on Long Island that provides electric service to Nassau and Suffolk counties and the Rockaway Peninsula in Queens and provides electric service to approximately 1.1 million customers. LIPA owns 1,300 miles of electric transmission lines, 13,263 miles (9,066 miles OH & 4,197 miles of UG) of electric distribution lines and 110 substations. In 2011, it had 21,000 GWh of electricity sales, revenues of \$3.7 billion and total assets of \$11.8 billion. LIPA is a fiscally independent public corporation that does not receive State funds, tax revenues or credits. The forerunner of LIPA was the Long Island Lighting Company (LILCO). VM is the largest O&M expenditure.

3. Comparative Assessment of LIPA's Vegetation Management Program

3.1 Methodology for selecting distribution/transmission circuits each year for preventative maintenance:

3.1.1 LIPA:

Distribution:

LIPA utilizes a circuit prioritization model to select the distribution circuits for each year's VM program. This model is based on the cumulative Customers Interrupted (CI) since last trim cycle. CI is primary driver receiving a 75 percent weighting. Field intelligence from the LIPA VM Line Clearance Supervisor's (LCS) is given 25 percent weighting to overall score. However, in conversation with various LCS's, they feel that it is difficult to make changes to the priority list that is supplied by Reliability Management.

LIPA budgets for 1,600 miles per year. Top ranked circuits for the system are assigned until 1,600 miles have been reached. Circuits below this point do not receive full circuit maintenance, but, may receive spot trimming as needs dictate. The current years' cycle trimming recommendations does not include circuits trimmed the previous year.

Transmission:

Transmission voltage starts at 23 kV, and also includes 33 kV as well as 69 kV circuits that are mainly located along roadsides with 138 kV being their systems' highest voltage which is normally located on a well delineated right-of-way (ROW). Transmission circuits selection is based on a combination of circuit reliability due to trees for the lower voltages (< 69 kV) and the selection for the higher voltages (>69 kV) is based on last maintenance date in combination with twice a year ROW audits. The transmission cycle is a flexible five-year cycle with approximately 200 miles trimmed and performs IVM on approximately 500 acres of ROW floor per year. LIPA maintains an entire transmission line with respect to pruning, but, does not maintain the entire floor of the ROW for each line. The ROW floor is maintained based on those locations requiring maintenance as determined by last maintenance date and maintenance history.

3.1.2 Industry:

Utilities in the Northeast select circuits based on last maintenance date and maintain a fairly constant cycle year to year. Individual circuit reliability is often, but not always, used to determine the circuit priority in a given year.

3.1.3 Comparative Summary:

In general, other companies provide greater weighting to years since last maintenance and proximity of trees to conductors than LIPA does.

3.2 Method for designating pruning cycles for distribution and transmission circuits:

3.2.1 LIPA:

Distribution

In 1999, as the 5-year cycle was near completion, the LIPA Reliability Engineering group was asked to assess the effectiveness of the VM program. A review of electric interruption data at that time disclosed, that for the most part, for several years after tree maintenance, overhead distribution circuits typically exhibited a noticeable decrease in tree-caused interruptions. That analysis indicated that only 70 (of the 720) distribution circuits experienced over 1,000 customer interruptions within that three-year period. The 1,000 customer interruption threshold was determined by the shape of the curve (reflecting a majority of interruptions) and budgetary constraints. These 70 circuits thus became the initial circuits migrated to the 3-year cycle trim.

Also based upon the 1999 analysis, approximately 250 circuits experienced virtually no tree caused interruptions after five years. Therefore, in order to maintain the distribution tree trimming budget (approx. \$11 million annually) with minimal impact to reliability going forward, these 250 circuits were placed on the 7-year cycle. The remaining 400 overhead distribution circuits remained on the 5-year trim cycle.

From the 1999 study, a cycle by circuit was established as follows:

- 3-year cycle – 130 circuits
- 5-year cycle – 436 circuits
- 7-year cycle – 237 circuits

The circuit designation (3-year, 5-year, and 7-year) is a permanent designation for the circuits as determined in 1999. The cycle is reviewed to account for changing field conditions approximately every 10 years. Annual circuit selection is made by the LIPA Reliability Management group, without significant input from the LCS's.

There are 9,066 miles of overhead distribution and currently LIPA prunes 1,600 annually. This equates to a system average cycle of 5.6 years.

Transmission

There are 1,099 miles of ROW (over 25 kV). About 100 miles never require tree pruning, and there are about 1,000 actual miles that require pruning. Approximately 200 miles are pruned per year or an approximate 5-year cycle. Some lines get maintained every 3 years due to tree proximity and lack of easement. LIPA has not implemented a fixed cycle for transmission tree pruning program. The transmission circuit selection is based on need; last maintenance date, tree species and associated growth rates, voltage, vegetation proximity to conductors, line reliability and the results of a twice per year (leaves on and leaves off) visual ground patrol by the LIPA transmission VM staff. Transmission line conditions vary by span as there is a lot of variability across the system. ROW floor maintenance of brush¹ is performed on approximately 500 acres per year (a very flexible 5-year cycle due to annual grass mowing on about 350 acres per year with brush hogging occurring on slightly less than 650 acres at intervals of 6 or more

¹ Brush is defined as tall-growing tree species currently less than four inches in diameter.

years); hence slightly more than 500 acres is either mow or brush hogged annually. Selective herbicide applications are used on approximately 650 ROW acres (LIPA fee-owned ROW only).

3.2.2 Industry:

Distribution

There are three key factors that commonly determine the appropriate overall pruning cycle for a given area: (1) the characteristics of the tree workload (primarily species composition), (2) local regrowth rates, and (3) the clearance achieved at the time of pruning. Utilities normally encourage removal of fast-growing species and especially trees located directly under the lines. Utilities also utilize of natural pruning techniques, which result in slower regrowth than stub cutting. Otherwise, utilities have little control over the tree workload characteristics and regrowth rates. On the other hand, a utility can significantly influence the clearance obtained at the time of pruning.

Considerations such as line construction, tree regrowth rates, clearance, customer density and circuit reliability have been used by some utilities to modify the target cycle or work scope for specific circuits. Based on conditions, the cycle for an individual circuit can be extended, shortened or augmented with mid-cycle selective maintenance, but not exceed a set backstop cycle length (the maximum cycle any circuit can go between maintenance).

Other utilities in the Northeast follow various cycle guidelines as determined by their respective vegetation species distribution, regrowth rates, clearance standards and construction type. The following is a sample of other utility vegetation maintenance distribution target cycles:

Midwest-rural	5-year and; 6-year by geography
Far north East-rural	5-year cycle
Midwest- urban/suburban/rural	4-year cycle with mid-cycle
Midwest-Urban	4-year urban and 6-year rural cycle
NE-urban	5-year cycle with mid-cycle
NE-suburban / rural	Reliability based
NE-urban/suburban	4-year cycle
NE-mixed suburban / rural	4-year cycle
NE-urban/suburban	4-year three-phase; 8-year single-phase (switching to a 4-year cycle on all circuits)
New England-suburban / rural	5-year cycle- minimal mid-cycle work

Transmission

The majority of utilities throughout the country are now subject to NERC standards. A transmission ROW treatment cycle is a fixed number of years between maintenance on a line/circuit basis. The length of the cycle varies by utility and is determined by ROW width, voltage (as a function of line clearances), tall-growing tree species and their estimated annual vegetation growth rates on a particular system. Transmission cycles often vary from three years, where there are long growing seasons and productive sites, to six years or longer where there is a shorter growing season and less productive sites. Again, there are often localized adjustments made for exceptional ROW clearances (over valleys) and other areas of special concern that have established buffer zones such as riparian areas, e.g., wetlands. In addition to maintenance

cycle for edge pruning or removal and floor maintenance using integrated vegetation management (IVM) transmission owners have implemented at least annual inspections aimed at identifying maintenance needs that may occur between cycles.

3.2.3 Comparative Summary:

Distribution: The industry has established fixed cycle lengths based on date of last maintenance. In some cases this is adjusted using reliability data, but, there is a “back-stop” cycle length that is not exceeded. LIPA’s variable length cycle based primarily on reliability does not have a back-stop cycle length.

Transmission: The norm for the industry is to maintain entire lines on a fixed cycle, supplemented with annual inspections. LIPA maintains an entire transmission line on a flexible schedule with respect to pruning, but, does not maintain the entire floor of the ROW at the time of pruning. The ROW floor is maintained based need as determined from field inspection as well as the last maintenance date along with site specific maintenance history

3.3 Method of conducting hot spot or point specific pruning based on system performance, including work tracking mechanisms:

3.3.1 LIPA:

Reliability Management identifies troublesome locations (device to device, fuse locations, fused taps, mainline to first device, etc.) with poor reliability due to vegetation conditions. In addition, the operating crews and troublemen identify locations encountered in circuit surveys and their day-to-day work. Additional locations may be identified through customer calls.

The VM LSC's perform a field investigation of reported tree-caused outages for major distribution outages, lockouts, and transmission events. Currently these findings are informally captured (e-mail to management). In the future, LIPA hopes to develop a tracking system (database). In the past there were manual forms to fill out to track outage investigations. Reliability Management also conducts some investigations of three-phase station lockouts. From these various sources a “hot-spot” pruning list is developed. This is an ongoing process throughout the year.

3.3.2 Industry:

The industry in general utilizes much the same criteria and methods to identify “hot-spot” work as LIPA. One key difference is that many utilities perform post-outage autopsies on tree caused outages to determine the cause of the outage and assess whether it was preventable or non-preventable (preventable – normal pruning program would have prevented the outage; non-preventable – whole tree failure from off-ROW). These post-outage autopsies are normally conducted by staff or contract foresters/arborists within the VM group. Additional information often collected includes species, and detail regarding tree conditions, (broken branch vs. grow in, etc.) and data on construction type and last maintenance. The data is collected on handheld units or paper forms and dumped into simple data base or pivot tables. Some utilities include a GPS location. Some more advanced systems tie the outage autopsy information to a map layer for

further analysis and to determine trends geographically. This data is then analyzed and specific strategies developed to mitigate the primary causes of outages. This may include a species-specific tree removal program, and species-specific clearance specifications. Field verification and information gathering on tree-caused outages is considered a best management practice.

3.3.3 Comparative Summary:

LIPA and the industry utilize generally the same methods to identify “hot-spot” work. The key difference is that many utilities perform post-outage autopsies on tree-caused outages to determine details of the condition of the tree causing the outage and to determine if it was a preventable or non-preventable outage.

3.4 Methods for vine mitigation:

3.4.1 LIPA:

As required per specification, all contractor crews (planned maintenance, hot-spot, storm hardening, etc.) cut all vines at the ground line or to the lowest attachment point. No herbicides are used. Several years ago LIPA piloted a two-person vine mitigation crew with some success in reducing the vine issues on the LIIPA system.

3.4.2 Industry:

It is a generally accepted practice for all utilities to cut vines when encountered. This includes poles, guy wire, transmission and substation structures, etc. Generally the specifications are similar to LIPA except the vines are cut at the ground line and at six feet above ground, and the stump of the vines are treated with herbicides to prevent re-growth.

3.4.3 Comparative Summary

Vine mitigation as practice by LIPA is the same as that of most utilities, the significant difference is that most utilities cut and treat vines with herbicides to prevent re-sprouting while LIPA does not.

3.5 Methodology for Storm hardening tree removal (including integration with other programs, such capital investments):

3.5.1 LIPA:

Storm hardening includes those activities LIPA undertakes to provide an increased level of system reliability in the event of major storms.

LIPA adopted a proactive storm hardening policy in 2006 to address the threat of severe storms including hurricanes. This long-term program has an anticipated budget of up to \$500 Million over 20 years to improve the capability of the electric system and to withstand the impacts of hurricanes and other severe storms. Another goal is to shorten the time required to restore service when outages occur due to storms.

The policy incorporates 3 areas of focus: Durability (minimize damage caused by severe storms);

Resilience (minimize impact of storm damage); and Restoration (minimize outage times). Initially \$20 million per year was set aside specifically for storm hardening initiatives and specific programs / projects to address critical infrastructure. LIPA's Storm Hardening Plan to improve durability and resilience include:

- Installation of new underground circuits
- Replace deteriorated poles
- Protect substations from flooding and storm surges
- Reinforce substation foundations and structures to withstand higher wind speeds
- Increase strength of selected transmission pole lines to withstand higher wind speeds and storm related flooding along LIRR corridors and at major road crossings
- Prioritize Transmission Lines for hardening
- Increase strength of selected distribution pole lines to withstand higher wind speeds
- Distribution circuit supply points
- Key automated circuit sectionalizing points
- Major equipment poles
- Increase tree trimming clearance and removal of hazardous trees/limbs outside clearance zones

As a result of Hurricane Irene:

- No storm hardened ASU poles experienced damage
- No downed wires involving hardened highway road crossings
- No damaged hardened feeder exit poles
- No substations experienced storm surge related flooding damage or wind related damage

Circuits for LIPA Storm Hardening are recommended by Reliability Management using interruption data on a circuit basis from major and minor weather events, looking particularly for whole tree failures and circuit lockouts. Once determined, maps are provided to the regional LCS, who in turn assigns the maps to the tree contractors for field evaluation. The tree contractors assign an inspector to designated circuits to identify hazard trees. Their job is to identify hazardous trees. When identified, these trees are tagged for removal and permission is secured. The work is then assigned to the Storm Hardening crew for removal. The work is done on a unit price basis (\$/Dia. Inch classes). LIPA does not have a written procedure or directions to the contractors for the selection of trees for removal; this is left up the contractor to determine. This effort is aimed primarily at three-phase construction. The Storm Hardening initiative has had wide acceptance and cooperation from municipalities, with nearly 100% of municipalities on board with this program. LIPA is currently spending \$2,000,000 per year storm hardening. The increased tree clearance aspect of the storm hardening initiative has not been implemented.

LIPA is currently re-evaluating their vegetation storm hardening process. In addition, LIPA VM is in the process of developing a handheld hazard tree identification program to support the identification and mitigation process. It is currently being field tested by the LIPA Transmission VM group.

3.5.2 Industry:

Storm hardening is a relatively new term in industry and not every utility's definition of storm hardening is the same. There has been increasing focus on system hardening and resiliency measures in response to storm-related outages of electric distribution facilities. The recent increase in storm activity and extreme weather events has highlighted the need for reinforcing and upgrading the aging electric distribution infrastructure.

System hardening is defined as physical changes to the utility's infrastructure to make it less susceptible to storm damage, such as high winds, flooding, or flying debris. Hardening improves the durability and stability of transmission and distribution infrastructure allowing the system to withstand the impacts of severe weather events with minimal damage. System resiliency refers to the ability of utilities to recover quickly from damage to any of its facilities' components. Resiliency measures do not prevent damage. These measures enable electric facilities to continue operating despite damage and/or promote a rapid return to normal operations when damages and outages do occur.

Storm hardening is handled in two primary ways: 1) part of the cyclic maintenance program; 2) a separately budgeted program specifically aimed at storm hardening (such as LIPA has). In many cases, storm hardening and a directed hazard tree reduction program are one in the same. When part of the cyclic maintenance program, special attention is given to hazard tree removal on the three-phase main lines. In a "stand-alone" program, vegetation manager with the assistance from Reliability Engineering, select critical circuits based on load or particular customers served. Normally these specifically identified circuits have critical sections on the three-phase main line identified for storm hardening or hazard tree removal. This has proven to be an effective method of improving system reliability, but, and a significantly higher cost than cyclic maintenance alone. Specific risk tree criteria are established based on local documentation of historic tree failures.

3.5.3 Comparative Summary:

Many utilities follow a similar strategy as LIPA with respect to vegetation-related storm hardening. However, these utilities have well-defined criteria for determining what constitutes a hazard tree to be targeted as part of storm hardening. In addition, other utilities target storm hardening to very specific segments of the overhead system, such as three-phase main lines on circuits that experience high CI levels per mile. National Grid has developed an effective program in New England for risk tree reduction that is a good model.

3.6 Procurement bidding strategies for different programs (Unit Price/ Lump Sum/ Time and Equipment etc.):

3.6.1 LIPA:

LIPA uses different contract types for different aspects of the VM program:

- Distribution cyclic maintenance – a 3-year firm price per mile within each LIPA designated console or geographic area. One contractor is selected for each console for the

period of the contract. This can prove problematic from the contractors resource planning perspective (especially the smaller contractors) as the annual work volume (number of circuits and associated miles) can vary significantly depending on which circuits are selected based on the reliability model used by LIPA.

- Storm Hardening and Hazard Tree programs – contractors selected based on a unit price for various diameter classes of trees to be removed.
- Hot-spot work, customer tickets, work orders, transmission side trimming – contracts are awarded on a Time and Equipment basis
- ROW mowing, spraying and floor maintenance – awarded based on a cost per acre

3.6.2 Industry:

Three different approaches are commonly used by electric utilities to contract line clearance work. These include "time and material/equipment" (T&M or T&E), "unit price" and "firm price" or "lump sum" pricing strategies. Each has advantages and disadvantages that are important to understand, and there are multiple variations possible within each pricing family. Each carries a different risk profile for the contractor and the utility. Unit price and firm price contracts are inherently performance-based contracts. However, T&M with incentive pricing can also be a performance-based contracting strategy.

Performance-based contract strategies generally offer the lowest production risk for the utility by placing the burden to monitor crew productivity on the tree contractor and "incentivizing" the contractor to control costs. This applies to firm price, lump sum, unit price, and T&M with incentive type contracts. However, it should be understood that in order for these contract strategies to be effective, the utility and contractor should have a thorough understanding of the work scope, historical man-hours and costs for the work units to be maintained within the contract period. While it is possible to utilize these specific contract types for all work (i.e. reactive type work as well as preventative maintenance work), they are the most effective in situations where the scope of work is better defined such as on preventative maintenance. Reactive work such as customer trim requests and restoration are often too variable and can lead to higher "unit" prices due to the "contingency" contractors may build into their bid to account for this uncertainty.

Where historical data is not available, some utilities are successful in developing performance-based contracts by clearly defining the project scope prior to bidding through the development of detailed work plans. Pre-planning to define clearances, clearance exceptions, and removals has proven to be a very effective strategy in receiving least cost competitive bids. Contractors provide pricing on the defined work scope that the utility has pre-designated, thus eliminating guess work on the part of the contractor and reducing the "contingency" cost that contractors build into bids. However, this does require additional effort on the part of the utility to employ knowledgeable personnel to perform the pre-work planning as well as post work acceptance. This strategy generally works well when the utility is developing firm price contracts in the form of a guaranteed cost per mile or a guaranteed cost per circuit.

Utilizing a T&M with incentives type contract is a viable alternative for preventative maintenance work, but does require an extensive knowledge of historical man-hours in order to develop "should take times" in order to set contractor valid targets or thresholds for each work unit. In this contract type, the utility agrees to pay the contractor for their total actual man-hours

incurred to complete the work unit. The contractor in turn, agrees to meet the established target and “share” with the utility any cost savings achieved by completing the work unit with less man-hours than allotted. Some contracts also include a shared “penalty” where the contractor agrees to also share the cost of any work units exceeding the threshold man-hours. This provides the contractor with an incentive to find cost savings as part of a shared risk approach.

Another variation to this contract type includes a T&M not to exceed. In this contract type, the contractor and utility agree that any cost savings will be shared; however, the contractor bears the entire burden for any cost over-runs above the man-hour threshold set by the utility. The advantage to this contract strategy is that the utility can have 100 percent confidence in their maximum expenditure which they can then use to better plan and budget. The disadvantage is that the contractor may include higher pricing due to the “contingency” variable and therefore, it may not offer the same cost savings as could be expected through the shared incentive/penalty contract.

Utilizing multiple contract strategies for vegetation management is generally the most cost effective. Performance based contracts are preferred for preventative maintenance type work but should be utilized in combination with other contract strategies to ensure overall program cost effectiveness. Firm price or unit price contracts are most effective for brush maintenance or herbicide treatment programs where the contractor can easily inspect and quantify the work volume. Competitive bidding of these work types ensures the contractor will provide the lowest unit price based on their estimated cost to complete the defined work scope and their known material costs (i.e. herbicide costs). T&M contracts (without incentives) offer the greatest level of flexibility to the utility in terms of being able to easily add or remove work scope and therefore are recommended for ticket type work. For the contractor, T&M minimizes their risk where work scope is variable or undefined as in Customer Trim Requests and Restoration type work. This allows the contractor to provide better pricing but shifts the burden to the utility to ensure that crews remain productive. Even so, T&M is generally considered the preferred method for these work types. A combination of all the contract strategies tailored toward specific work types, will offer the greatest potential for cost savings to the utility while minimizing the resources required to monitor contractor performance.

Documented inspection of completed work and establishment of clear standards are critical to achieving value from firm price or unit price contracts. Where clearance requirements may be variable due to customer concerns or in situations where work scope is not clearly defined (as with ticket work), T&M normally can provide a better value.

In recent years, the impacts of fuel price fluctuations have become a major concern for contractors as well for the utilities they work for. Concerns arise when contract rates are set at a time when fuel prices are at the extremes and then change dramatically over the life of the contract. This either leaves the contractor with a windfall profit if fuel prices decrease (and the utility with higher costs) or can result in significant loss of profits for the contractor if fuel prices increase. Shorter contract periods (i.e. one-year) can minimize potential risk, but can be costly in terms of the cost to develop new contracts every year, and in terms of higher rates from contractors due to increased risk from shorter contract periods. Many utilities have elected to incorporate fuel escalators into their contracts to offset this concern.

For hazard tree and storm hardening, the most common method utilized in the industry is unit price based on diameter of trees being removed. Hot-spot work, customer tickets, work orders are almost exclusively done on a time and equipment basis.

3.6.3 Comparative Summary:

The bidding and contracting strategies used by LIPA are similar to other utilities. However, LIPA practice of establishing firm price per mile by console contracts without the contractor knowing which, if any circuits will be released for work is unique to LIPA. A price per mile contracting strategy is frequently used for routine preventive maintenance by other utilities. However, other utilities using this strategy often have a more clearly establish and uniform scope of work than LIPA. A clearly defined scope is an important consideration in the use of a firm price contracting strategy. Based on ECI's field observations, the actual clearances achieved at the time of maintenance on the LIPA distribution system range from three feet to over 10 feet. The clearance achieved at time of maintenance varies most from region to region; however, it also varies within a region and within a circuit. Because of inconsistent enforcement of the clearance specification, the current contracting strategy is less effective than it could be. The contractors on firm price contracts are encouraged to avoid confrontations with customers over clearance (as is evidenced form the wide disparity in clearances throughout LIPA). In addition, there is little incentive for brush removal. In making cost comparisons to other utilities, LIPA cost per mile is abnormally low for the tree density on the system. Minimal clearance standards as compared to other utilities and the lack of compliance with this standard in many locations help explain this relatively low cost per mile. Removal of immature, tall-growing trees (brush) from under conductors is a substantial portion of the cost per mile at many utilities and helps reduce future workload. LIPA's current cost per mile, while comparatively low, also reflects a less extensive scope of work and more variable scope of work than many utilities that utilize price per mile contracting strategies.

3.7 Process of establishing trimming specifications for both Distribution and Transmission:

3.7.1 LIPA:

The LIPA process for establishing specifications is to adopt specifications that have been in place historically at LIPA. The LIPA specifications were developed to cover cutting, clearing, pruning and tree removal on the distribution and transmission system. The intent of the LIPA specification is to define minimally acceptable clearances to be obtained between overhead conductors and vegetation. The general goal and objective is to provide safe and reliable electric service through a cost effective vegetation management system. Tree pruning, as currently undertaken by LIPA, provides clearance between trees and conductors equivalent to two to three years of growth in most regions of Long Island. The LIPA specifications are designed to address:

- Minimum clearance requirements to sustain safe, reliable electric service while striving to satisfy the concerns of sensitive customer,
- Optimum clearance requirements necessary to sustain an appropriate level of safety and reliability.
- Use of arboricultural methods acceptable to LIPA (follow guidelines established in ANSI A300

The following are the current LIPA distribution clearances contained in the specifications. Clearances are to the nearest energized conductor:

- a. six (6) feet side clearance
- b. six (6) feet clearance from overhanging limbs
- c. six (6) feet under-clearance
- d. 3 ft secondaries
- e. 1 ft triplex

Variations to the specifications are common in practice among LIPA regions based on ECI's field evaluation. Figure 1 shows the estimated average annual regrowth for deciduous and coniferous tree species found on the LIPA system. This chart based on previous ECI study of the LIPA system using regional regrowth rates² for common species found at LIPA. Figure 1 shows that at the current LIPA distribution clearance of six feet (72inches), pruned deciduous trees would reach the conductors in three years and coniferous trees would reach the conductors in approximately seven years. To achieve a five year cycle would require LIPA to have eight foot of clearance at the time of maintenance and to achieve a six year nine foot of clearance at the time of maintenance.

In anticipation of future NERC rule changes, LIPA has begun, on a limited basis, achieving 25' of clearance on 138kV transmission lines. This transition to greater clearance is designed to be accomplished after about five years or one transmission maintenance cycle.

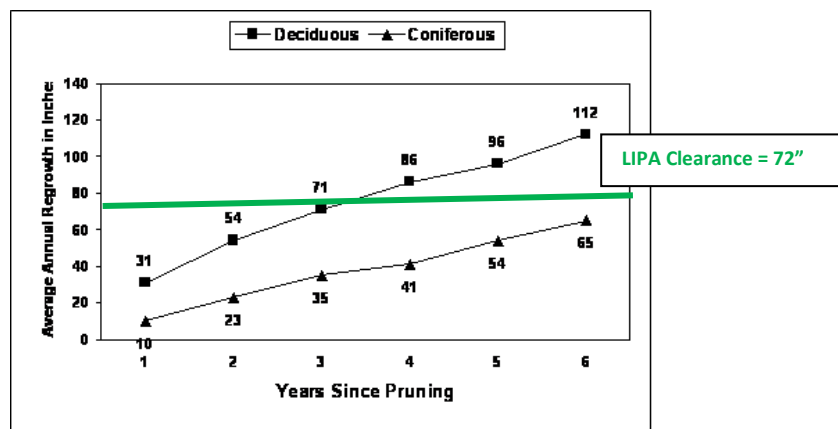

Figure 1. Estimated average annual regrowth rates for the common tree species found on the LIPA distribution system.

3.7.2 Industry:

Pruning/VM specifications are designed to help utilities meet their particular VM objectives. These objectives include: providing a safe and reliable electric system for the general public and to minimize tree-related outages; maintaining positive customer relations; utilize sound environmental practices. Specifications provide an incentive to the Contractor for exceeding

² Represent s the average side and top regrowth for the common species found on the LIPA system using regional regrowth data from other ECI studies.

certain production and quality criteria and assess liquidated damages for failing to maintain certain production and quality criteria.

Specifications establish procedures for tree pruning that are governed by approved principles of modern arboriculture published by Tree Care Industry Association (TCIA, formerly National Arborist Association), the International Society of Arboriculture (ISA), American National Standard Institute (ANSI A300 and Z133). Specifications establish when and under what circumstances a utility representative can grant exceptions to these pruning standards and where mechanical trimming equipment can be used. Specifications establish how pruning shall be done to protect tree health.

Designated clearances are an integral part of any specification for VM. Characteristics that utilities use to determine the clearance specification are determined by a combination of factors such as:

- Line construction type (cross arm construction and size of cross-arms, vertical construction, etc.)
- Conductor type (three-phase bare wire, three-phase coated wire, Hendrix Cable, aluminum, copper, etc.)
- Voltage
- Species composition and growth rate
- Pruning type
- Customer sensitivity

When ECI conducts a workload survey of a distribution system, the tree population is identified and quantified by species type. ECI, using our proprietary growth model, determines the regrowth for the major species on the system (representing a minimum of 80 percent of all trees). Regrowth is determined for side, top and under the conductors by species by measuring the regrowth since last maintenance. In addition, an average regrowth rated for all trimming types for deciduous and coniferous trees is developed. Figure 1 represents this regrowth model for the LIPA system using the most common tree species and regional regrowth data.

As reflected in Table 1, clearance often varies within a utility based on the characteristics mentioned. Some utilities use a species specific clearance based on regrowth rates and/or voltage while other utilities have a more traditional fixed distance clearance specified. Clearances can range from a low of six feet to fifteen feet for distribution. Many utilities also specify “no overhang”, on the three-phase or mainline portions of their system. There is no one uniform or standard clearance, and may vary between and within a given utility. Another way of expressing or deterring clearance is to specify that contractor must achieve adequate clearance to a specific number of years (3, 4, 5, 6, etc.) years of clearance between vegetation and conductors.

While LIPA’s transmission clearance does not specifically specify “ground-to-sky pruning” or edge to edge ROW clearing. However, ECI’s filed observations, especially on the 138 kV lines; it does appear they are going edge to edge and ground to sky.

TABLE 1. Various Utility Clearance Specifications

Utility Description	Type Construction	PRIMARY CLEARANCE				Comments
			Side	Over	Under	
Urban/ Suburban	Dist <69kV		8'	12'	10'	
Urban/Suburban/	Dist < 69kV		15'	15'	15'	Trim for 4-year clearance
Urban/Suburban/	Distribution Primary	Urban/Residential	6'	7'	7'	2' trunk to main limb
		Rural/Industrial	8'	12'	12'	2' trunk to main limb
Urban/ Suburban	Distribution Primary		8'	15'	10'	Side- 20' for danger trees and dead wood; Over- includes danger trees and dead limbs; Under- preferable ground cut
Urban/ suburban/ Rural	Distribution Primary up to 34 kV	Fast growing	8'	6'	8'	Specs broken out by service, isolated open wire secondary, open wire secondary, secondary cable, primary voltage, primary aerial cable, 34 kV. Large tree trunks or major limbs of established trees may remain as close as 2'. Overhang- all dead overhang to be removed.
Urban/ Suburban	Distribution Primary up to 69 kV-open wire		8'	12'	10'	
	Distribution Primary up to 69 kV- cable		4'	4'	4'	
Suburban/Rural			15'	ALL	GL	Side- clear 15' either side of center line; Overhang – remove all; Under –ground line all tall growing tree species on ROW
Urban/suburban/ Rural	Distribution Primary 2-25 kV	Slow Growing	8'	(a)	6'	(a) Remove all hazardous overhang and all overhang within 15' of the conductor that could contact them if weakened or broken
		Fast Growing	12'	(a)	8'	

An ECI 2005 benchmarking study representing 23 utilities reported clearance standards for voltages under 15 kV; 61% of respondents reported that they require 10 feet of clearance, 13% reported that they required less than 10 feet, and 26% reported that they achieve greater than 10 feet of clearance.

3.7.3 Comparative Summary:

Clearances are normally established in concert with cycle lengths. Greater clearance distances allow for longer cycles and lower costs. Some utilities utilize species-specific clearance standards with the greatest clearance for the fastest growing trees. The industry normally establishes clearances in specifications that are greater than specified by LIPA or utilize shorter cycle lengths if narrow clearance standards are utilized.

LIPA's distribution clearance specification process relies on historical practices within the company that were established to minimize perceived adverse public reaction to utility line clearance. In general, utilities periodically review and revise their clearance standards/specifications to reflect current needs. In anticipation of changes in NERC standards, LIPA has begun to increase side clearance to 25' on 138kV lines.

3.8 Herbicide specifications for Distribution and Transmission:

3.8.1 LIPA:

LIPA does not utilize herbicides as a component of distribution VM and only utilizes herbicides on fee-owned transmission ROW. Concern about public perceptions regarding herbicides is the major factor limiting herbicide use. Agricultural use of specific insecticides on Long Island resulted in ground water contamination in the 1970's. LIPA does utilize herbicides on the majority (approximately 65 percent) of their substations; however, they do not use herbicides with a long-term soil residual effect. On the remaining 35 percent of the substations', post-emergent herbicides such as Glyphosate® are used.

LIPA maintains transmission ROW's in high visibility residential areas by mowing three times per year. During the drafting of the SC Pine Barrens regulations, LILCO at the time agreed to not use herbicides on transmission ROW's in the Pine Barrens Preserve. The soil in the Pine Barrens is poor, resulting in slow rates of vegetation regrowth and reestablishment following mowing. Consequently mowing has become an effective method of controlling ROW brush in the Pine Barrens. This was evidenced during ECI's field review.

3.8.2 Industry:

Herbicides are less commonly used as a part of distribution VM programs in the Northeast than in other parts of the country.

In the South, Southeast and Midwest, herbicides are a common tool utilized in distribution VM programs. These herbicide treatments include treating standing brush on distribution easements via foliar applications. Some utilities treat standing brush on distribution easements using a dormant basal application. Most utilities specify that all cut vines and cut tree stumps be treated with herbicides.

The use of herbicides is a widely accepted tool in vegetation management on transmission ROW's and is an integral tool in the practice of Integrated Vegetation Management (IVM) for most utilities in the U.S. Applications range from low-volume backpack treatments to aerial applications. In most cases, herbicides are the main tool utilized in ROW floor maintenance. The most effective programs have experienced substantial decreases in herbicide volume applied from cycle to cycle as ROW ecology is transformed to grass-forb cover types. It is essentially not possible to practice IVM without the use of herbicides.

The use of herbicides is considered a Best Management Practice for controlling brush and stump re-sprouting on distribution systems.

The effectiveness of selective herbicide applications has been well documented through long-term studies on utility rights-of-way in the central and northeastern United States. Results from treatment simulation models developed through these studies project that sites dominated by deciduous species would nearly double in stem density by the end of two cycles if simply cut without a follow-up herbicide application. These same sites would be expected to exhibit about a 50 percent reduction in stem density over the same time period if treated with a selective herbicide application.

3.8.3 Comparative Summary:

LIPA's specification regarding herbicide use is far from the industry norm. LIPA does not utilize herbicides on distribution and limits use on transmission ROW to those areas LIPA owns in fee. Other utilities utilize herbicides to a limited degree on distribution (stump treatment) and have widespread use on transmission lines and as a key tool in IVM.

3.9 NERC Transmission Vegetation Management Program applicability:

3.9.1 LIPA:

Basically LIPA is completely unregulated with regard to all facets of transmission vegetation management both at the state and national levels. The FERC/NERC transmission vegetation management reliability standards FAC-003-1 (and the newly approved FAC-003-2 version that has been substantially revised) standards do not apply to LIPA. To date, no lines under 200kV have been so designated by LIPA's RRO now officially referred to as the Regional Entities (RE), which for the LIPA is the Northeast Power Coordinating Council (NPCC). The NPCC has not declared a single LIPA line less than 200 kV to be critical. LIPA has no transmission facilities over 200 kV which would trigger the application of NERC standards. Furthermore, the NYSDPS no longer (since the late 90's) regulates LIPA's electric rates so there is no legal mechanism for the NYSDPS to oversee their programs or costs associated with transmission VM. In 1998 the PSC made the policy decision not to regulate LIPA at all in regard to transmission ROW VM, including even their former jurisdiction under Article VII.

There is a potential that LIPA Article VII lines would be subject to the NYPSC oversight, however, this does not seem to be the case at this time. However, in anticipation of changes in NERC standards, LIPA has begun to increase side clearance to 25' on 138kV lines.

LIPA, as currently unregulated by the PSC, has not had to comply with any of these new "enhanced ROW management activities" as directed by the PSC and implemented by the other NYS utilities. As specially stated in related PSC documents; "The Long Island Power Authority (LIPA) and the New York Power Authority (NYPA) are outside the Commission's jurisdiction for this purpose."

3.9.1.1 FERC & NERC (BES & TVM Standard) and NYS PSC Implications for Future LIPA TVM

Although LIPA is not currently subject to NERC, they have increased specified clearances since 2012 on a case by case basis to achieve 25-foot clearance on the 138 kV transmission lines in anticipation of NERC compliance requirements in the future.

The concurrent FERC/NERC regulatory/standard setting issues involved in the determination of the status of what voltage transmission lines to include within the purview of the BES and almost simultaneously the voltage of the lines to be subject to the TVM standard FAC-003-2 has major ramifications for the future of LIPA transmission vegetation management.

Although both standards setting processes are moving in the same FERC-driven direction, i.e., lowering the threshold of applicability, each circumstance has a distinctly different FERC-devised rationale for the same overall purpose or end point. FERC, in the case of FAC-003-2,

was from the onset never keen on NERC's bright-line applicability threshold of 200 kV for the TVM standards in that the Commission always felt it might exclude a significant number of transmission lines that could impact Bulk-Power System reliability even though there was a route specified in FAC-003-1 to include those lower voltage lines designated by the RRO as critical.

The new applicability method proposed by NERC to fulfill FERC's directives for the revised TVM Standard now focuses instead on specific criteria to determine the applicability to all sub-200kV facilities that are now identified as an element of the Interconnection Reliability Operating Limit (IROL). By virtue of relying on IROL as a proxy for identifying reliability importance, the newly proposed TVM standard by NERC now uses an "impact-based approach" for determining applicability according to FERC. As stated by FERC in its NOPR, "NERC has used an impact-based approach for determining applicability rather than a bright-line threshold as a means of balancing the potential increased burden on transmission owners under a standard with expanded applicability." But FERC did provide some additional cautionary remarks that transmission lines not designated as an IROL element (or the equivalent) have been instrumental in causing major blackouts, including the August 2003 Northeast blackout. FERC also brought up the issues first mentioned in their report on the 2011 Southwest outage that found failure to properly designate IROLs as a major cause of that outage. Therefore, as part of the broader inquiry into whether the TVM standard covers "lines that have an impact on reliability," FERC still seeks further comment on how NERC will assure that IROLs are properly designated. Moreover, FERC noted that some entities also identify seasonal IROLs and it expects any sub-200 kV elements of seasonal IROLs to be likewise subject to the TVM standards FAC-003-2.

FERC, as mentioned previously, went well beyond just the TVM standards 200 kV bright-line issue when FERC released their NOPR on March 18, 2010 directing NERC to include all electric transmission facilities of 100 kV or more in its definition of what constitutes the BES subject to all mandatory reliability standards. FERC took umbrage with NERC's loose definition of BES that included lines "generally operated at voltages of 100 kV or higher."

FERC has repeatedly declared that it is their firm belief that the best way to address these concerns about the definition of BES is to maintain a bright-line threshold that includes all facilities operated at or above 100 kV (except defined radial facilities). The aim of the Final Rule (to redefine BES) according to FERC in Order 743 is to; "eliminate inconsistencies across regions, eliminate the ambiguity created by the current discretion in NERC's definition of bulk electric system, provide a backstop review to ensure that any variations do not compromise reliability, and ensure that facilities that could significantly affect reliability are subject to mandatory rules."

FERC's rationale for their expansion of the BES definition was multifold as FERC also felt that there is a strong technical justification for a standard 100 kV threshold. FERC Stated that transmission lines with a rating of 100-200 kV represent a significant portion of the total circuit miles of transmission within the BES and events on these lines can often have severe ramifications on the BES. FERC has noted that facilities rated at 115 kV and 138 kV have either caused or contributed to significant BES disturbances and cascading outages. As one example highlighted by FERC was the Feb. 26, 2008, Florida blackout originated from a fault at a facility connected to the 138 kV transmission system. FERC also cited numerous other recent events as evidence of the impact of 115 and 138 kV facilities on BES reliability. FERC definitely wants

uniformity in the definition of BES and the ready identification of all facilities (elements) that are subject to mandatory Reliability Standards.

FERC went on to emphasize that there are even many “critical” transmission facilities, rated at less than the 100 kV, which once identified should also be subject to all the mandatory Reliability Standards. FERC has acknowledged that 25 percent or more of many public utilities’ total transmission line miles operate below 100 kV and such facilities may well be as much a part of the Bulk-Power System as the transmission facilities operating at or above 100 kV because these lower voltage facilities support the higher voltage facilities. FERC attested it is not unusual to see outages of 69 kV transmission facilities limiting the higher voltage transmission facilities with which they are networked. FERC has consistently interpreted the term “bulk electric system” over the years to apply not only to all of the > 100 kV transmission systems but also to any underlying transmission system < 100 kV that could limit or supplement the operation of the higher voltage transmission systems.

FERC took specific exception to the NPCC in particular (LIPA’s Regional Entity) in that they have not made all transmission facilities that could significantly affect reliability subject to the Reliability Standards. FERC noted that NPCC’s use of this discretion has resulted in an impact-based approach to defining the BES that allows significant subjectivity in application and thus creates anomalous results. In fact, NPCC’s use of its discretion brought the problems with the current definition to FERC’s immediate attention, and as FERC has pointed out; the NPCC material impact assessment has resulted in inconsistent classification of some transmission facilities. Hence FERC has vigorously rejected NPCC’s material impact assessment due to its subjective language and failure to identify critical facilities necessary to reliably operate the BES.

So, on the one hand NERC (with FERC approval) is seemingly retaining significant vestiges of a bright-line threshold that includes all facilities operated at or above 200 kV with exceptions for IROL lines. The determination of IROL lines is based on a “material impact assessment” which will then decide exactly what facilities less than 200 kV now come under the jurisdiction of the TVM standards FAC-003-2. Then on the other hand, FERC is redefining the BES definition for NERC by establishing a bright-line threshold that includes all facilities operated at or above 100 kV (with significant inclusions for the identification of critical lines under 100 kV) that specifically rejects a “material based impact assessment” approach as both flawed and a failure. Further confusing the issue is that in FERC Order 743 issued on November 18, 2010 the FERC mentioned that it would be possible to grant the clarification sought by commenter’s that the 100 kV threshold in the BES definition will not modify thresholds established in individual Reliability Standards such as FAC-003 (the only standard even mentioned). This single specific reference to exempting FAC-003 line voltage thresholds was not found in the January 25, 2012 NERC Petition to FERC for Approval of a Revised Definition of BES nor in any subsequent FERC NOPRs or Orders on the BES definition issue.

A plain reading of all this leads one to strongly suspect that the ultimate designation of transmission facilities to be included in the BES as well as the TVM standards will be quite similar, if not the same. Hence numerous transmission facilities now excluded, particularly in the NPCC region, that are less than 200 kV will foreseeably be the newly-identified elements to be included not only in the BES but most likely the TVM standards as well. LIPA should expect that for all practical purposes that its entire overhead 138 kV transmission system will be subject to FAC-003-2 in the not too distant future. And depending upon the circumstances and ultimate

evaluation criteria used to determine IROL and the inclusion process for elements of the BES, perhaps a significant portion of their 69 kV lines will also be similarly included.

Likewise the PSC staff should perhaps revisit the circumstances that allowed letting LIPA completely out of their regulatory prerogative with regard to their vegetation management operations within and along previously jurisdictional transmission facilities. Numerous transmission lines subject to the Article VII process have been certified and built (many simply upgraded) over the past 40 plus years since its inception in 1970. As a great many of the current LIPA transmission facilities were previously licensed under the auspices of Article VII, these PSC certified lines should still be subject to all the past and present PSC requirements including those requiring Long Range ROW Management Plans that are yet subordinate to PSC staff field monitoring. If and when the PSC ever reestablishes their 'rightful' authority over at least those portions of the LIPA transmission system that were once certified under Article VII,

LIPA may then wish to evaluate their option of including all their other transmission lines (non-Article VII and lower voltage lines) into their PSC 'System-Wide' Long Range ROW Management Plan for Article VII certified facilities much the same as NYPA has done for their entire transmission system and other utilities have done for lines under the nominal PSC jurisdiction of 34 kV. This would provide LIPA with a single set of appropriate ROW vegetation management strategies for all their demarcated transmission facilities. It would also provide LIPA with a 'second set of eyes' in regard to reliability based ROW vegetation management as well as a 'back-stop' to insure some modicum of performance. Regulatory mandates coupled with direct oversight could also aid LIPA in convincing the public (mainly underlying ROW land and abutment owners along with those living in close proximity to the ROW) that intensive transmission ROW vegetation management including the selective application of herbicides is often necessary to support a high degree of electric system reliability, i.e., no tree-caused outages.³

With all the momentous transformations occurring since 2005 (as instigated by the 2003 Northeast Blackout and particularly acute in NYS) as to the exacting manner in which practically all facets of transmission ROW vegetation management must now be performed to ensure electrical reliability, LIPA has been completely (if unintentionally) omitted from all these recently imposed 'sea-changing' events. In fact, all other TOs in NYS have been subject to the classical adage of "belt & suspenders" i.e., having a dual governing system imposed upon them. With the PSC providing the traditional 'belt' of rules and regulations while FERC/NERC deliver the newly legislated 'suspenders' with mandatory and enforceable reliability standards. LIPA in the meantime has been immune to all these historic events directly affecting practically every aspect of transmission ROW vegetation management elsewhere and thus has been allowed to

³ "The early 1990's brought significant changes to ROW management on Long Island. First, officials from the NY State Department of Public Service (DPS) approached LILCO, and requested that the company develop a ROW management staff to include dedicated transmission foresters. Soon afterward, these forestry personnel began to work with DPS staff to bring the LILCO program more into conformity with other State utilities. DPS staff was quick to note that LILCO's program depended to a great extent on expensive mowing treatments, and did not include selective ROW herbicide treatments which had been shown to provide cost effective brush management in NY State, while promoting species and habitat diversity. A limited herbicide "test" program began in 1993. Results indicated that foliar treatments to fairly young re-sprouts might be the most effective means of providing reliable brush control." From a paper by Ferrandiz, L.S. "A Broad-based IVM Approach to ROW Management on Long Island, NY" 2004.

continue to employ in an unconstrained and uncontested manner various vegetation management practices that are now, in some part, considered rather outdated, e.g., extensive use of tree trimming/pruning within LIPA transmission ROW, in light of the contemporary authoritarian regulatory environment to remove all impediments to reliability.

This virtually completely unregulated situation has made a comparative analysis of the LIPA Transmission System's vegetation management program to other analogous electric utilities that are similarly situated TOs, particularly those in NYS, especially difficult (if not impossible) to perform⁴ due to the aforementioned quite unique complete insusceptibility of LIPA to both the present Federal (FERC/NERC TVM standard FAC-003 begun in 2005) as well as State (PSC Orders dating back to the early 1980's and the more recent PSC Order for requiring 'Enhanced Vegetation Management' issued in 2005). These national and state governing bodies have both evolved individually very exacting (but different) standards and/or requirements that are rigorously applied for just this specific electric utility endeavor, i.e., virtually all aspects transmission ROW vegetation management.

3.9.1.2 LIPA: Generally Very Narrow Transmission ROW

Much of the LIPA transmission system, particularly the 69 kV and 138 kV lines were either built originally on somewhat relatively narrow constrained ROW (due in large part to preexisting well-established land use patterns) or were upgraded (e.g., 69 kV to 138 kV) without any new additional clearing, i.e., no further widening of the previously existing ROW. In the Article VII Certification process this capacity to simply upgrade an existing transmission facility without any additional enlargement of a project 'footprint' was a very desirable outcome in the attempt to demonstrate how the projects parameters could minimize environmental impact. As these 'new' upgraded LIPA transmission lines could be simply renovated from existing 69 kV lines mainly by installing insulators capable of supporting the much higher voltage 138 kV transmission lines, these major projects would then require no additional property rights from public or private land owners and hence new clearing of the ROW was unneeded.

Over the more than four decades of Article VII cases on Long Island (since 1970) the ideal scenario was to naturally upgrade existing lines without any new ROW width being added. For a recent example; "pursuant to the Certificate of Environmental Compatibility and Public Need (Article VII Certificate) issued by the NYPSC on July 12, 2012 in Case 11-T-0116, the order for the Wildwood to Riverhead Overhead Transmission Line Upgrade from 69 kV to 138 kV noted:

"The selected route, access points and configuration is preferred because it uses existing transmission lines and right-of-way, avoids or minimizes the disturbance of natural habitat and agricultural land, is reasonable in terms of cost, and avoids disturbance of residential and commercial properties, activities, traffic and emergency operations in a populated area. No additional clearing of the right-of-way is needed for the Project."

⁴ LIPA has informed the reviewers that on average they spend twice as much on pruning/trimming large trees on their transmission ROW than they do on traditional ground up vegetation management treatments from the floor of the ROW. To the contrary, most TOs under NERC FAC-003 and more so those also under the NYS PSC Part 84 rules spend only a small percentage of their annual transmission ROW budgets on tree pruning/trimming operations. Hence right from the onset there are macro differences between LIPA and all other industry constituents to which a similar comparison could be readily made.

Although these new ‘upgraded’ LIPA transmission facilities were built with minimum environmental and land use disruption, future vegetation management becomes much more problematic and costly for two reasons. First, the trees allowed to continue to grow along the edge of these narrow ROW are located at the same distance away from these now higher voltage conductors. The higher the voltage the further the flashover distance and thus vegetation should actually be located further away instead of at the same distance when a higher voltage is encountered. Thus when lateral limbs and branches from trees along the outside edge of the ROW began to grow toward the lines this now triggers the need for much more frequent and extensive side trimming/pruning to maintain at all times the proper conductor clearance distances. Limbs and braches that heretofore would have been allowed to remain untouched when a lower voltage was occupying the ROW would now have to be removed back to the bole (tree trunk) or sufficiently trimmed further back well beyond flashover range to allow for growth. Because the trees are located so much closer from an electrical perspective this tree trimming cycle would need to occur more frequently and more work (more limbs) will be affected.

Second, although the number of potential off-ROW danger trees⁵ that could physically strike the conductors will not be measurably higher, due to the closer ‘electrical’ proximity (i.e., the distance from tree stem to conductor is closer than is normally found for a line of this voltage) there are some additional trees of sufficient height and distance that could contact the conductors electrically (i.e., pass close enough if they fell toward the line to draw an electrical arc). Also, the new higher voltage of these upgraded LIPA transmission facilities makes outages due to danger tree contacts much more impacting on overall system reliability. Consequently, the prospective conduct of an appropriate danger tree identification and removal program becomes far more critical for these higher voltage lines. The end result of these transmission upgrades is actually the acute need for more aggressive danger tree removals along the outside edge of the ROW.

These tighter than standard ROW conditions for LIPA make comparisons to other typical transmission owners (who most often do not have such restrictive ROW widths) more challenging, by first necessitating that LIPA perform much more side trimming than is usually required along with a less compromising danger tree removal program. Moreover, these consistently relatively narrow LIPA transmission ROW can also inadvertently help thwart the acceptable implementation of a quite universal ROW vegetation best management practice (BMP); that of the wire zone/border zone approach to maintaining reliability.

The overall stated purpose of the mandatory and enforceable NERC TVM Standards FAC-003-1 are; “To improve the reliability of the electric transmission systems by preventing outages from vegetation located on transmission rights-of-way (ROW) and minimizing outages from vegetation located adjacent to ROW.” FERC has defined a ROW as a “segment of land used for the route of a transmission line. A ROW should be devoid of vegetation that can interfere with a transmission line. The ROW width is the distance between the outer bounds of a right-of-way. There is very little uniformity in regard to right-of-way width.”⁶ The primary purpose of a high voltage transmission line ROW is the safe and reliable delivery of electrical energy services. ROW widths vary significantly among the multitude of transmission owners nationwide.

⁵ Danger trees are trees that could strike electrical conductors if they fell toward the lines.

⁶ Utility Vegetation Management and Bulk Electric Reliability Report From The Federal Energy Regulatory Commission September 7, 2004

Generally, ROW width increases as line voltage increases. Higher voltage lines require wider ROW because greater separation is needed between conductors and the adjacent vegetation. Wider ROW's are also necessary to accommodate multiple circuits and in some cases more than one set of towers. Since ROW width depends on many factors there is a range of acceptable distances. For, example, the conventional

ROW width of most current 138 kV single circuit transmission lines with a horizontal conductor configuration is typically in the order of 75 to 150 feet with 100-125 feet being quite common.

However, these customary transmission line ROW widths were usually established by engineering or construction standards solely on the need to prevent line contact with adjacent off ROW vegetation due to line swing or sway (also referred to as a 'blowout' standard) in effect when the line was built. These currently established ROW nominal widths will help prevent vegetation-related encroachment that can result in a sustained outage(s) due to the blowing together of the lines and vegetation located just outside the ROW edge. These current customary ROW widths coupled with some diligent tree removal along both outside edges of the ROW together with the occasional removal of large tree limbs growing horizontally into the ROW will in almost all situations sufficiently minimize the chances of tree contact with swaying lines. Regrettably, the general widths of LIPA transmission lines are usually found in the extreme narrower classifications particularly for those lines that have been upgraded over the years.

However, even these rather 'wide' conventional ROW widths will not prevent outages from all potential trees falling onto the lines from outside the ROW. Almost all of these presently acceptable ROW widths are almost exclusively based on protecting against tree conductor conflicts arising from conductor sway/swing but completely fail to consider the extent of continuing exposure to the enduring tree failure risk that resides along the outside forested edge of the cleared ROW. As stated in the UTILITY VEGETATION MANAGEMENT FINAL REPORT dated MARCH 2004 COMMISSIONED by FERC TO SUPPORT THE FEDERAL INVESTIGATION OF THE AUGUST 14, 2003 NORTHEAST BLACKOUT; "The ROW width should be determined based on the following objective: No vegetation, or parts of vegetation, shall be allowed to grow or fall into the transmission facilities. For example, if native trees have a mature height of 100 feet, the 'ideal' initial easement should be wide enough to ensure that existing and future trees (along the side of the ROW) will not, by accident or design, fall into the facilities." This report also stated that; "ROW widths should take into consideration specific factors such as topography and the mature height of local vegetation, among others." In general, if a utility has a wider ROW, it will be more successful in avoiding vegetation-line contact than a utility that maintains narrower ROW. A narrow ROW increases the risk of contact with vegetation that is outside of the ROW and adjacent to the transmission line. In fact, most tree/power line contacts occur when trees fall onto lines from outside the ROW or corridor. LIPA with its predilection to have much more narrow or constrained ROW width that a normal TO has acerbated this problem to the extreme.

3.9.1.3 Current TVM Practices Performed by LIPA

This comparative analysis reviewed numerous documents supplied by LIPA personnel pertaining to their long range TVM plans and the implementation of their annual ROW work programs. Interviews were also held with key TVM staff members and a daylong inspection of their transmission system was performed. The LIPA catalog of their enumerated TVM techniques and ROW treatment methods available are more than adequate to conduct prescriptive management

over the entire range of possible vegetation conditions found on Long Island. The list of commercial herbicides accessible to LIPA's for their use in TVM is likewise sufficient to control all the target species encountered throughout the LIPA service territory. The inspections dramatically demonstrated that LIPA has assertively pursued their ROW vegetation management; where integrated vegetation management particularly with selective application of herbicides is able to be practiced from the floor of the ROW there were few (low densities) of tall growing target tree species found. Where IVM is pursued without herbicide application, the trees were removed to the extent that none were found anywhere near the wire security zones. When tall trees were purposefully allowed to remain located within or in close proximity to the ROW they all had been pruned back to distance well exceeding the established wire security zones.

Although not compulsory on any LIPA transmission ROW, in so far as observed clearances (distances from managed vegetation to conductors) are concerned, the standards set by NERC under FAC-003-1 for Clearance 1 (distances at the time of maintenance) and Clearance 2 (minimal set distances to be observed at all times) were being maintained somewhat inadvertently⁷ by LIPA. Hence, from strictly this single but critically important tree clearance perspective there were no "red flags" encountered during the field inspection process of LIPA's transmission system. However, it should be emphasized that these tree clearances observed were quite adequate under all normally encountered circumstances. However, due to the generally much narrower than normal LIPA ROW widths, coupled to the virtually non-existent regulatory oversight (no encouragement for enhanced tree removals), the resulting relative proximity of so many large trees located often times within the ROW proper (albeit trimmed back) or close-by the transmission facilities along the ROW boundary can have deleterious consequences under less than favorable conditions. Tree clearances maintained by LIPA were more than adequate to avoid contact from the normal swing and sway of the conductors.⁸ When natural disasters such as hurricanes, wind shear, fresh gales, major storms, ice storms, and floods occur the heretofore large stock of otherwise healthy but trimmed-back trees that are allowed to continuously occupy sites in the immediate vicinity to the lines are then much more readily available to fall. Such tall and close-by trees can then easily fall onto the conductors and/or strike the support structures causing substantial facility damage and numerous line outages that because of their extensiveness (repetitive nature of numerous trees falling onto any given line) cannot be readily repaired and placed back in service in a timely manner in the aftermath of such calamitous events.

Herein lays the real dilemma relentlessly faced by LIPA, which is effectively found practically everywhere on Long Island alongside (and even within ROW) their wide-ranging transmission system. Throughout LIPA's service territory they are constantly subject to the very real constraints imposed by tightly-knit suburban land use patterns; intensive land use activities coupled to residential visual landscape expectancies that are endemic to the very fabric of Long Island's natural/social environments. It is the totality of these intense limitations imposed upon LIPA that inhibits their actual TVM prerogatives that makes both narrow ROW an imperative and likewise promotes the company's need to often accept the existence of numerous large trees

⁷ LIPA staff was not aware that they were actually keeping their clearances in accord with the general principles espoused by the NERC TVM Standard FAC-003-1.

⁸ The 138 kV lines were by far in the best shape with more than adequate clearances. In some instances it was noted with the 69 kV lines had trees in closer proximity but still with adequate clearances. The 33 kV and 23 kV lines exhibited many more cases of minimal allowed clearances and much more trimming in evidence.

within their ROW easements proper. The overriding issue of just exactly what constitutes “appropriate tree removals” for reliable electric service (even after natural disasters) from the near-vicinity of transmission lines provokes such an instant public policy conflict as to be virtually irreconcilable. Instead of even risking any such wrath (i.e., the public outcry) for any attempt at large scale tree removals, LIPA continues to pursue a course of minimizing any perceived environmental disruption (at a monetary cost of higher annual expenditures)⁹ along their high voltage lines. These trimming efforts, mowing, occasional large tree removals and IVM (with the selective application of herbicides where they can practice it) will often suffice to maintain reliability for all reasonably ordinary situations (e.g., lines clearances are kept sufficiently wide to ensure that the maximum swing and sway of both conductors and trees will not cause a flashover). However, such long-term TVM activities that allow the continued presence of tall trees in close proximity to transmission lines will ultimately result in calamitous outcomes when major storm events occur that cause numerous trees to fail nearly simultaneously. In these major storm events many large trees can fall into the nearby wires causing not only temporary line to ground faults but also pronounced destruction to the facilities over a short timeframe producing outages and blackouts of prolonged duration.

It is a simple matter of a too-close physical presence; trees vs. high voltage transmission lines, i.e., too many mature tall trees located too close to these critical high voltage power lines. TOs that don’t have these large trees growing within their ROW (that must be routinely trimmed back frequently), who don’t have extremely narrow ROW (with the attendant wall of danger trees located close at hand also requiring side trimming of all lateral braches) and who also have the ability to reasonably remove threatening and high risk off-ROW danger trees will not have such massive storm damage occurring from adjacent trees falling on the conductors. However, in the distinctive Long Island environment, LIPA’s limited capacity to perform adequate TVM to provide enough separation of trees from the lines to truly minimize storm damage is compromised as it is a quite daunting proposition to remove all line threatening trees ‘en masses’ from a societal standpoint, but not from an engineering maintenance capability. In other words; it could be done but it can’t be done.

Refer to References Section 4.2, of the report for a detailed history and assessment of the LIPA transmission vegetation management program in regards to both the state and national reliability standards.

3.9.2 Industry:

Utilities with transmission lines at or in excess of 200kV are subject to FERC¹⁰/NERC oversight. The other utilities in NYS are regulated by both the PSC for all T&D operations and by NERC for transmission lines over 200 kV. Ironically, the NYPA has always had PSC involvement with their Article VII lines in regards to the submission, approval and monitoring of their long-range ROW vegetation management plans and inspections, etc. and has also opted to include the remainder of the NYPA transmission system in the Part 84 jurisdiction of the PSC.

⁹ Although it can be more expensive to remove a tree than trim it, the need to repeatedly trim over many years makes the long- term costs of trimming (and the fact that the trimmed tree still poses a threat to line reliability if it were to fall) much higher.

¹⁰ Federal Energy Regulatory Commission

NERC (FAC-001-1 and the new FAC-001-2) requires utilities to intensively manage their transmission assets. In addition to a general vegetation plan, they have detailed annual vegetation management work plans. Staffs are comprised of employees with backgrounds in forestry or the natural sciences. Strict schedules for line patrol are maintained as is QA following work by contractors to ensure that work meets specifications. Budgets have been established to provide fixed transmission ROW maintenance cycles that for the most part are in the three to five year range. In addition, utilities have gone to great lengths to develop and implement technology to accurately identify the locations of work, track work as it is completed and track QA and keep this and all associated data for periodic reports and assessment of the transmission vegetation management program. Accurate, precise and timely records are a must to avoid not only outage violations but record keeping violations following a NERC audit. Many of the processes for managing vegetation affecting transmission lines over 200 kV are also applied to ROW VM where voltages are below 200 kV.

3.9.3 Comparative Summary:

Unlike the majority of utilities that manage transmission ROW, LIPA is not subject to NERC rules and regulations. Current NERC standards for vegetation management start at 200 kV. In the future, this may change to 100 kV. Other New York utilities submit long-range vegetation management plans to the NYPSC for review. Although not required of LIPA, this has been beneficial to other utilities.

3.10 Environmental review and protection process:

3.10.1 LIPA:

Environmental does not get involved to a great extent unless called to evaluate a situation by VM staff. When so notified, the LIPA Environmental staff is utilized for sensitive issues on both distribution and transmission. The environmental staff is seldom called upon to assist with distribution issues. The LIPA VM staff is aware of environmental regulations and where required, pursues permits through the internal Environmental group. LIPA has a close working relationship with the Environmental Group to ensure compliance at the Federal, State, and local level.

LIPA Environmental provides annual training to tree crews and LCS on environmental issues, especially wetlands and avian issues. When Environmental gets calls to evaluated wetland issues, they are delineated with wetland layers on GIS maps and provided to VM staff.

3.10.2 Industry:

Utilities in managing vegetation, both distribution and transmission, are very much aware of environmental regulations and strive to met the intent of these regulations. The industry follows many of the same practices/procedures as does LIPA. The industry is proactive in addressing environmental concerns in the planning stages of projects to ensure compliance with Federal, State and local regulations related to wetlands, migratory birds, rare and endangered plant and animals, etc.

3.10.3 Comparative Summary:

LIPA and the utility industry are similar in terms of environmental review and protection. The known areas requiring special permits/procedures have been identified and when the vegetation management cycle is near, vegetation management engages environmental to assist in securing necessary permits. Utility environmental departments provide support to utilities in general and also at LIPA as needed for special circumstances.

3.11 Licensing and permitting requirements to support vegetation management activities:**3.11.1 LIPA:**

LIPA has full cooperation and assistance for their internal Environmental group in carrying out vegetation maintenance activities. In areas where permits are required (wetlands, Pine Barrens, etc.) the LIPA VM staff works closely with internal environmental staff to ensure compliance.

The mowing in tidal marine environment needs to be permitted. In the Pine Barrens, environmental works with VM as some special mowing techniques are used (high mower height). The Pine Barrens Commission needs to authorize new construction (development), but don't get involved in routine maintenance that follows established standards. Concerns involving invasive species have come up on Gas and Article VII projects.

Tree removal permits at the municipal, county and state level are normally secured by the contractor and in some cases by the respective LCS.

3.11.2 Industry:

The utility industry, similar to LIPA, receives the cooperation and assistance for their internal environmental group in carrying out vegetation maintenance activities. In areas where permits are required utilities engage their internal environmental staff to ensure compliance with environmental regulations on primarily for transmission VM, but, for distribution VM as well when required. Environmental compliance is not only being a good citizen, but, a good business decision as well in the avoidance of large fines and the associated bad press.

In certain areas there are restrictions on pruning (trim within specific time periods only) or movement of wood due to emerald ash borer, Dutch elm disease and other pests and pathogens that impact trees. Environmental compliance for many utilities has become one of the check-list of required items to be completed in the planning stages of distribution and transmission vegetation maintenance prior to sending crew into the field.

3.11.3 Comparative Summary:

The utility industry and LIPA are similar in the manner and extent to which they request and receive assistance in meeting permitting requirements related to vegetation management from their respective environmental groups.

3.12 Annual work scope / work plan methodology, i.e. Annual trim miles completed ratio to system total mileage for Distribution and Transmission:

3.12.1 LIPA:

Based on the average miles on the planned distribution maintenance program (1,600 miles per year out of 9,066 total distribution miles or an average cycle 5.6 year cycle), therefore LIPA maintains approximately 1/6th of the system each year, or a 1:6 ratio. However, this is a system average. In reality, some circuits are trimmed every two years while others have not been trimmed in 14 years. When systems such as LIPA are maintained based on reliability models without a cycle target, defining the program in miles maintained vs. total system miles has little meaning and is not a valid metric for comparison to other utilities. The transmission system is not maintained on a strict cyclic basis, rather maintenance based on field conditions in combination with last maintenance date.

3.12.2 Industry:

The industry in general, conducts both distribution and transmission maintenance through fairly fixed cycles. The ratio of miles schedule to total system miles is a function of the cycle (i.e. 1: 3 ration for a three-year cycle; 1:4 for a four-year cycle; 1:5 for a five-year cycle, etc.). The exceptions are utilities that are underfunded or have budgets that fluctuate widely from year to year. For these utilities, the ratios will vary each year. Substantial “hot-spotting” is the primary maintenance practice at some utilities with excessively long cycle lengths. The industry norm is for all circuits to be pruned over the cycle period. Section 3.2 lists a sampling of cycle lengths for similar utilities in the Midwest and the Northeast. Transmission system maintenance in the Northeast is generally on a four or five-year cycle, thus a 1:4 or 1:5 ration of miles maintained per year vs. total transmission system miles.

3.12.3 Comparative Summary:

The industry plans and completes both distribution and transmission work on a full circuit/line basis on fairly fixed maintenance cycles. LIPA does not follow the industry norm as they are more reactive in selection of work based on reliability history (distribution) and localized vegetation conditions (transmission).

3.13 Complement of tree trimming resources maintained (number of tree crews) i.e. average number of trimmers per month:

3.13.1 LIPA:

LIPA maintains tree contractor resources to meet the annual budget and to accomplish 1,600 miles of distribution cyclic maintenance, 200 miles of transmission pruning, 500 acres of transmission ROW floor maintenance, \$2,000,000 in Storm Hardening as well as crews to respond to customer calls, internal requests, hot-spot pruning and construction work orders. LIPA contractors assign approximately one general foreman to every 17 workers. Unless there are budget issues during the year, the workforce remains fairly constant to meet these goals. LIPA tracks the number of crews on the system by vendor as well as the number of workers

associated with those crews. This is updated weekly. The average number of tree workers, including general foremen on the LIPA system is approximately 146 but can vary considerably from month to month.

3.13.2 Industry:

Crew staffing is a function of budget, cycle and miles to be maintained. In general, the industry maintains consistent crew staffing throughout the year to meet their annual transmission and distribution mileage goals. However, under certain contracting strategies, crews come and leave the system as work is completed. It can generally be stated that the maximum number of crews are on any given system during the summer months (June - August). This is partially done to ensure adequate resources to meet storm emergency needs due to summer thunder storms and through hurricane season. This is also partially due to increased levels of customer ticket work, reliability work (hot-spot work) as well as capital work orders. At some utilities no additional contractor staffing occurs during the summer months as tree crews are shifted from other work activities. It is generally more efficient to maintain consistent crew staffing throughout the year. A stable workforce is often desired from the standpoint of work quality and safety. There is no one average that fits all utilities. Regardless of the contracting method, most utilities keep a daily or weekly log of crews/personnel on the system.

3.13.3 Comparative Summary:

LIPA is similar to the industry in that vegetation maintenance staffing is a function of budget. However, there is a difference in that many utilities completed reclamation cycles (cleared overgrown lines) many years ago and are now operating on a lower cost, fixed length maintenance cycle. Figure 2 illustrates projected investment and subsequent cost reductions as a percent of the current program budget for a utility moving toward a fixed cycle, along with the internal rate of return.

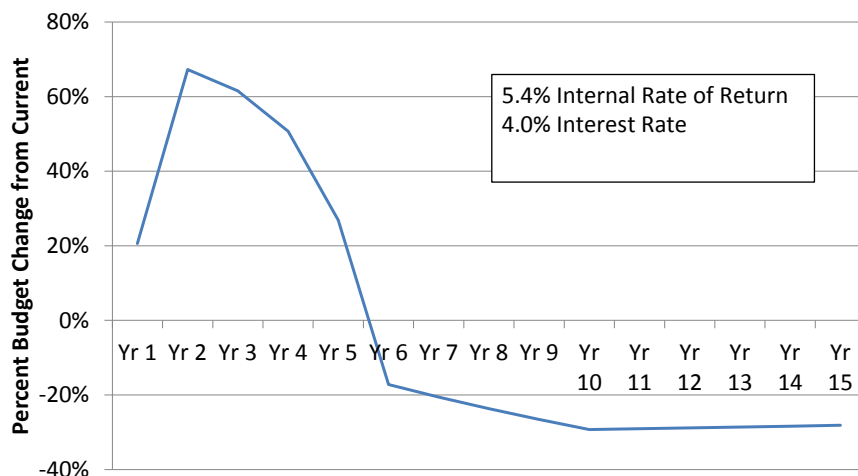

Figure 2. Modified internal rate of return example for a distribution vegetation clearance reclamation program followed by cyclic maintenance.

3.14 Determining appropriate resource requirements to maintain 1st Quartile reliability with similar overhead electric utilities:

3.14.1 LIPA:

LIPA uses a model based on reliability metrics to schedule circuits for tree maintenance. Approximately 18 percent of total miles are assigned to tree maintenance each year. The circuits that have the most outages receive the most frequent maintenance. Figure 3a presents a five-year trend that shows decreasing tree-caused interruption events (N) and tree-caused customer minutes interrupted (CMI) on mainline (three-phase lines) with major storms excluded. Figure 3b presents a five-year trend that shows decreasing tree-caused CI and N on mainline (three-phase) with major storms excluded.

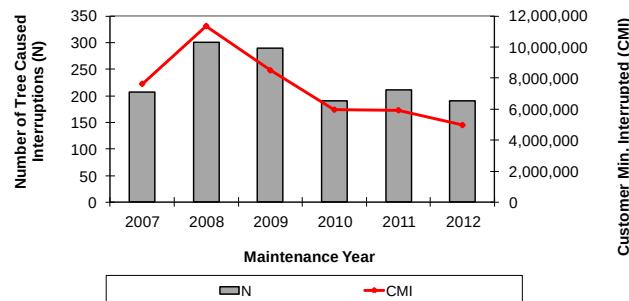

Figure 3a. Five year Trend in Number (N) of Tree-Caused Interruptions and Customer Minutes Interrupted (CMI) on Main Three-Phase Lines¹¹.

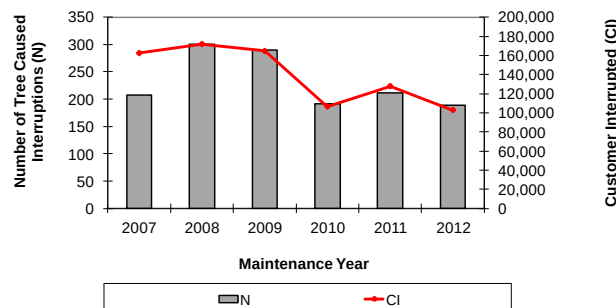

Figure 3b. Five year Trend in Number (N) of Tree-Caused Interrupted and Customers Interrupted (CI) on Main Three-Phase Lines⁴.

Figure 3c and 3d summarizes the five-year trend for all tree-caused outages (mainlines and branch lines) for Customer Interruptions (CI) and CMI respectively on the LIPA system, excluding storms.

¹¹ Notes: 1. Data reflects PSC Exclusions (reportable events only); 2. Primary mainline events only EC=2); 3. Sustained outages only (duration >/5).

¹¹ Notes: 1. Data reflects PSC Exclusions (reportable events only); 2. Primary mainline events only EC=2); 3. Sustained outages only (duration >/5).

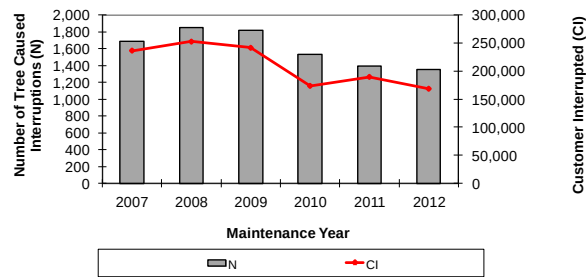

Figure 3c. Five year Trend in Number (N) of Tree-Caused Interrupted and Customers Interrupted (CI) on All Overhead Lines⁴.

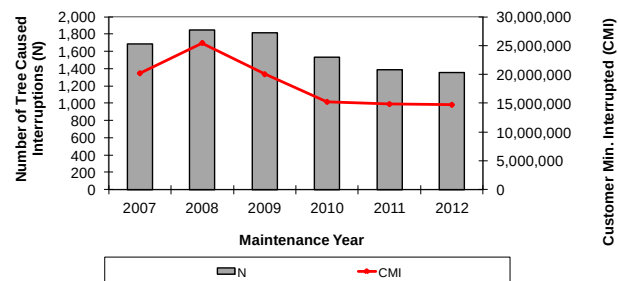

Figure 3d. Five year Trend in Number (N) of Tree-Caused Interrupted and Customers Min. Interrupted (CMI) on All Overhead Lines⁴.

LIPA has been experiencing an increase in planned (intentional) tree-caused outages (Figure 3e) due to an increase in request by customers' to prune/remove private property trees. There is also an increasing trend for planned outages by the LIPA tree contractors to provide a safety working distance due to overgrown line conditions.

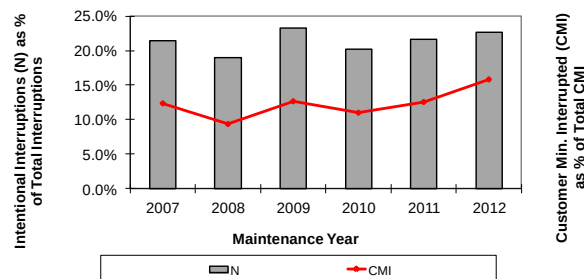

Figure 3e. Five-year Trend in Number (N) and Customers Minutes Interrupted (CMI) on All Overhead Lines due to Intentional Interruptions Expressed as Percentage of All Tree-caused Interruptions (Excluding Storms).

Figure 4 illustrates the relative cost of distribution vegetation maintenance operations at LIPA divided by the total distribution system primary miles, together with the key reliability metrics (major storms excluded) compared to other utilities. Costs include the multi-year average cost for both preventive and corrective vegetation maintenance, normalized for differences in tree density, local tree crew billing rates (cost of flagging/work area protection was included where

appropriate) and relative accessibility of vegetation to aerial lift equipment. LIPA's normalized cost per mile per year (annual expenditure divided by total line miles) was among the lowest in the group of nine similar utilities at \$469 per mile. LIPA's effectiveness of the maintenance expenditure was among the best based on interruptions per 100 miles (solid red line) and interruptions per 10,000 trees (dashed line). LIPA is getting the work done at a low cost and the work being performed is providing as great an impact on tree-caused interruption events as some other utilities in this group with a much higher asset cost per mile. In essence, LIPA is very efficient in terms of reducing vegetation cause outages when compared to similar utilities. .

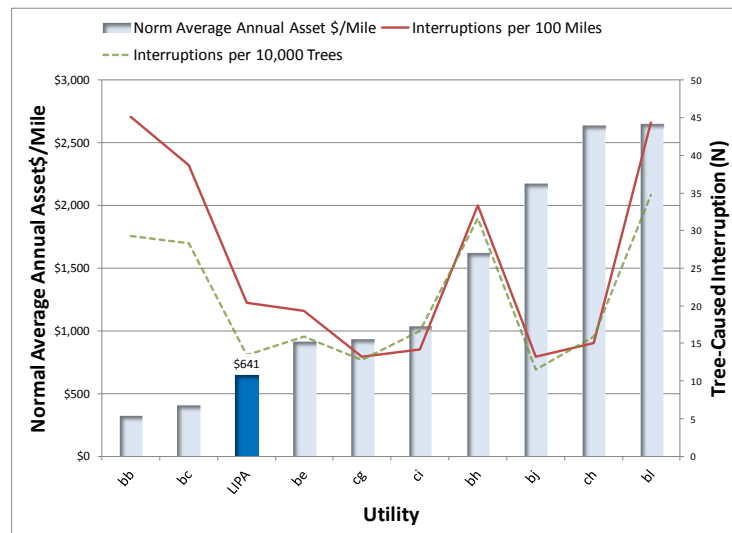

Figure 4. Normalized Average Annual Asset Cost per Mile

Annual patrols and close monitoring of system conditions relative to trees may have helped reduce tree-caused outages on transmission voltages significantly (2008 – 15 line trips and 2 outages; 2012 – 5 line trips with voltages less than 138 kV and no transmission outages on lines of any voltage).

3.14.2 Industry:

Over the years, many utilities established fixed-year pruning cycles and have determined the correct staffing level to accomplish their annual goals. The pruning cycle varies by utility from a fixed length cycle for complete circuit maintenance to variable cycle length by voltage on construction type (three-phase main line, three-phase taps, single phase, etc.) In addition, over the past decade, utilities have invested a lot of time, energy and money to re-claim both distribution and transmission ROW's so that they are now in a lower cost maintenance mode vs. a reactive mode of determining what, where and when to prune circuits. In addition, utilities are borrowing strategies from reliability centered maintenance (asset management) to prune circuits differently based on customer load, voltage, tree growth characteristics and are breaking their systems into smaller pieces for vegetation management and pruning on different cycles, (i.e.

main line to first protective device, separating three-phase from single-phase, etc.). Vegetation management over the last decade has also brought better understanding of how, what and where trees are causing reliability issues and programs are being developed to address specific problems. This has resulted in budgeted programs for storm hardening, hazard tree removal, danger tree identification and removal off- ROW. Therefore, it is not the number of crews a utility manages that provides 1st Quartile results, but rather how their resources are utilized that provides these results. It is a matter of implementing vegetation management vs. vegetation maintenance programs.

Other utilities do not respond to requests for make safe trimming by planned outage the way LIPA does. Rather they prune the tree in question if it is necessary to provide conductor clearance for private contractors. This difference may be due to the minimal clearance maintained by LIPA resulting in too much big wood to remove for a line clearance crew, increasing the “make safe” cost at LIPA.

3.14.3 Comparative Summary:

LIPA receives better than average benefit in terms of reduced tree-caused interruption events from its preventive maintenance program as compared to similar utilities surveyed. Compared to other utilities, LIPA achieves less clearance at the time of maintenance and few trees are removed. This keeps the cost low, but, limits the potential benefit of the vegetation maintenance.

As a result of recent major storms, LIPA has experienced a significant number of planned outages due to an increased in customer request for tree removals / punning, more than has been experienced by the industry comparison group.

3.15 Review of process and procedures utilized in obtaining additional resources required to support major outage events:

3.15.1 LIPA:

Prior to a major weather event, the central emergency response center is activated. Severity and track of pending storms are analyzed and based on models a decision may be made to seek additional line and tree crews. Through utility mutual aid agreements, LIPA can call on other utilities to request additional resources (line crew and tree crews) to meet the anticipated post-storm needs. In addition, LIPA reaches out to their tree contractors to request additional tree crews be brought onto the LIPA system in advance of or immediately after a major weather event. All resources, tree and line crews, are allocated by the central emergency response center to the remote reporting location based on conditions. All “outside” crews reporting to LIPA must first go through an orientation stand down to review safety and LIPA construction, voltages and other related information.

3.15.2 Industry:

The industry follows protocols similar to LIPA. Through preexisting mutual aid agreements and contractual arrangements with tree contractors, provisions have been made prior to storm as a part of Emergency Preparedness protocols, to supply additional crews for emergency situations. As there are limited resources available, those utilities that call for additional resources have an

advantage over other utilities in the same geographic region of the storm of being able to get additional resources. There is a high demand for additional crews during these severe weather events and if a utility waits too long to make the call for additional help, there may be limited or no assistance readily available. In these situations, utilities/ contractors outside the storm area will supply crews. Utilities have mutual aid agreements, but, these usually apply to line crews, not to tree crew resources. Contracts that specifically provide rates and terms applicable to storm restoration tree work help improve availability and response time to major events.

3.15.3 Comparative Summary:

LIPA is similar to other utilities in how they obtain additional tree contractor resources in anticipation of and following major storms.

3.16 Work force management – assessment of supervision span of control and organizational structure: establishing a) Qualifications of Service Provider, b) Line Clearance Contractor Qualifications

3.16.1 LIPA:

The qualifications of service providers are made as a part of purchasing review at the time bids are solicited. This evaluation determines if a contractor is qualified to bid on LIPA work. The management structure of most contractors is similar: a supervisor with numerous general foreman (GF) reports to that position. At LIPA, the contractors have approximately 17 tree workers per GF. The contractors report to the LIPA LCS for the region in which they are working. Much of the LCS time is devoted to clerical and administrative activities.

LIPA VM staffing consist of Regional distribution VM supervisors and two transmission VM Supervisors. Based on the LIPA distribution LCS staff of seven and approximately 146 contract distribution crews, LIPA's supervision to crew ratio is 1:21. On the surface, when compared to ECI analysis of utility staff to contractors in Figure 5, LIPA has a much higher than normal ratio of staff to field work force. However, is the ratio of staff to tree workers may not tell the whole story. The LIPA contractor work force varies in each region depending on the work priority in any given year. The contract workforce is not consistent year to year as the priority circuit's change each year. Therefore, some Regional VM supervisors will have a very light contractor contingency while another has a very large number of contractor's crews in a given year. In addition, the LIPA VM staff is burdened with administrative work that keeps them out of the field. Administrative duties include production and cost data input for internal reports, answering customer calls, coordinating planned outages for customer tree removals and contract tree crews as well as numerous other tasks add duties to the supervisors that are outside the norm. It would be more efficient and cost effective if these administrative tasks were handled by clerical staff, allowing the professionals to spend more time in the field to plan and evaluate work and assist with customer issues.

3.16.2 Industry:

In general the industry follows similar pattern as followed by LIPA in measuring/assessing contractor qualifications and how establishing how contractors are managed. Some utilities specify how many tree workers are to be assigned to each GF and how many GFs report to a supervisor.

Program effectiveness relies on qualified contractor supervisory personnel capable of work specification interpretation, contractor performance evaluation, contract administration and credible communication with customers and municipal officials. ECI has found that well-managed utilities may distribute responsibilities between their internal staff and the contractor in a variety of ways and attain success. The combined resources allocated to management and supervision, however, is the common factor among effective programs.

Adequate supervision of day-to-day operations is essential to the implementation of long-term cost-effective work practices and operating procedures. Most utilities have found that one person can effectively supervise about 8 to 10 small groups (i.e., line clearance crews) consisting of a maximum of about 25 to 30 people. ECI's experience in the utility line clearance industry and some studies support this level of supervision.

Figure 5 presents data from two benchmarking studies that evaluated the average number of line clearance crews supervised by utility arborists. In the Pennsylvania Electric Association (PEA) and Edison Electric Institute (EEI) studies, the average ratio of line clearance crews to each utility arborist was respectively 8 and 11 (Figure 5). However, in both studies 75 percent of the reporting utilities average 10 crews or less per supervising arborist. Figure 5 also shows that in a benchmarking study of over 20 utilities, the two overall best-in-class utilities have a ratio of approximately 1 utility arborist (including the system arborist) for every 6 line clearance crews.

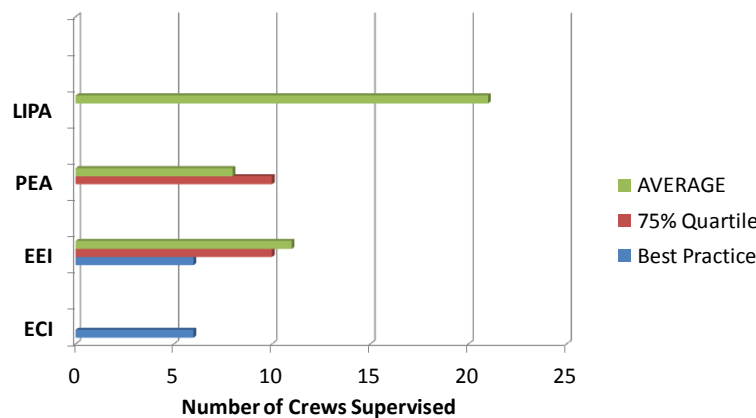

Figure 5. Comparative Data on the Average Number of Line Clearance Crews Overseen by Utility Foresters¹².

3.16.3 Comparative Summary:

LIPA follows utility practices regarding contractor qualifications, contractor supervision ratios and contract oversight through internal staff. If anything, LIPA has a better supervision to tree worker ratio than many similar utilities.

3.17 Techniques used to track work progress against plan:

a). Cost management inclusive of Data Management Process

¹² PEA = Data from a 7 utility survey conducted by the Pennsylvania Electric Association. EEI = Data from the Edison Electric Institute benchmark study of 29 utilities. ECI = Data from a benchmarking study of 22 North American utilities.

- b). Work Plan compliance inclusive of work plan process**
- c). Routine meeting with line clearance vendors**
- d). Digital or electronic mapping system of facilities used to track vegetation management**

3.17.1 LIPA:

Currently LIPA is using an SAP program to track contractor work accomplishment (but not productivity) and cost. Reports of work accomplishments and cost are available in the form of a spreadsheet. . LIPA tracks both distribution and transmission. The information is entered by the LCS by Division. Reports track information by region, circuit, cost per mile and miles completed. Tree removal records are based on a manual system for tracking and payment. The tree contractor work planner for storm hardening tags trees for removal with a numbered ID tag. This is then turned in to the LCS and dispatched to the removal crew. Cost is on per diameter inch basis and the tree removal and follow-up invoicing are tied to the tree tag number.

Work planning is handled separately using information supplied by Reliability Engineering. LIPA LCSs are in communication with the tree contractors daily and have both formal and informal meetings on a weekly basis regarding production, QA¹³, customer complaints, etc. Distribution does not have and is not utilizing electronic mapping. However, transmission is using such technology and important information is captured and various map layers are available for the transmission system for various aspects of vegetation management.

QA is a manual process performed informally by the regional LCS. LIPA does not have a formal line inspection QA program and no QC program. The LCS inspects completed circuits as time allows. There is not a set percent of completed work required to be inspected. Usually, checking of completed work is performed by the LCS weekly and tracked on a paper copy of the circuit map. The LCS meets with the contractor supervision on a weekly basis to review pending and completed work. The “go backs” are given to the contractor to take corrective actions and a follow-up inspection is made by the LCS to confirm these areas of inadequate clearance.

Utility vegetation managers in daily communication with the supervision of their tree contractor work force. In addition, weekly meeting are the norm as are formal status review meetings on a monthly basis. This is true regardless of the contract type (Firm Price, T&E, etc.).

3.17.2 Industry:

In the past decade, utilities in general have become very sophisticated in how vegetation management is tracked. Most utilities have programs that track production, cost, inadequate clearance, removal and this information is tied into invoicing as well as generating production and cost report on work completed vs. work pending. The level of sophistication varies from utility to utility. For some processes paper forms have been replaced by electronic data collection systems to populate databases and for report generation. The more innovative utilities have tied

¹³ QA is the systematic measurement, comparison to specifications and standards, monitoring of processes and an associated feedback loop that confirms specified clearances and standards have been met. QC is the process of ensuring the QA process was adequately carried out to meet desired results.

vegetation management to GIS for pruning, removal and QA. In addition, ESERI map layers are providing extremely valuable in managing these programs.

Comprehensive recordkeeping and reporting systems are an essential component of an effective line clearance program. Record keeping systems should be capable of providing management with the following information:

- Data for use in making sound vegetation management program decisions.
- Providing accurate monthly and annual program cost
- Building circuit workload history to better predict budget requirements in the future.
- Determination of the most cost effective crew type for various locations and work types.
- Connecting tree-caused outages at the circuit level to circuit VM history.
- Detailed monitoring of crew productivity.
- Establishing tracking process for customer refusals and hazard trees.

Comprehensive line clearance record keeping systems depend on recording four components of all field activities: work location, description of work completed, time required to complete the activity and any required materials. Time report verification, evaluation of crew productivity and accumulation of cost and production data all depend on these elements of activity reporting.

Recording crew time by specific work units and work related activities will provide the means to (1) examine detailed costs, (2) evaluate productivity, (3) initiate appropriate changes to maximize the efficiency of the program.

Many utilities have developed systems to track customer refusals and areas with inadequate clearance. Systems of this nature will assist utilities in tracking these outlying issues to completion.

3.17.3 Comparative Summary:

LIPA is somewhat behind the utility industry in developing and implementing management tools (software) that track production, cost and other associated vegetation management metrics. However, LIPA has been working on developing a more comprehensive overarching management system to better track and manage the various vegetation management programs.

3.18 Review and comparative industry assessment of current specifications / clearance zones for vegetation relative to facility voltage class or accessibility (highway/rear property), including: a) Review of easement / ROW restrictions pertinent to each utilities (Including pressure from local and state government):

3.18.1 LIPA:

LIPA has not only extremely narrow ROW/easements, but, in many cases lacks clear tree maintenance easement from span to span. Local government is fairly cooperative with vegetation maintenance especially when it is related to storm hardening. However, there are a lot of influential customers on the LIPA system who utilize local government on their behalf to seek clearance restrictions. LIPA is working with very poor ROW or easements both in width and wording regarding vegetation management when compared to other utilities. In essence, LIPA has only prescriptive rights on the majority of the distribution system.

3.18.2 Industry:

Most utilities have good relationships with local municipalities and other government agencies; however, there are some that have restrictions. These restrictions include certain working hours; established pruning clearances, permits required for tree removal, restriction regarding when oak and elm trees can be pruned due to oak wilt and Dutch elm disease. In general, most utilities have easements that include provisions for vegetation management and easements tend to be well established and tend to be approximately ± 15 foot of center line wider, some more and some less, depending on the easements within the utility. It is not unusual for easements to vary across a utility based on the when the easement was secured. As is the case at LIPA, many companies are made up of former smaller utilities that have been acquired over the years. It is often difficult to find one standard easement (distribution or transmission) within a utility. Where ROW or easements are lacking, utilities have pursued remedies such as tariffs or through service agreements with customers.

3.18.3 Comparative Summary:

LIPA has established specification in accordance with accepted industry practices; however, the specified clearance is less than the industry norm and is not based on regrowth rates. LIPA is also at an extreme disadvantage when it comes to easement and ROW width. LIPA's easements do not provide adequate provisions for line clearance and the company has very narrow ROW's (distribution and transmission) compared to similar utilities.

3.19 Process to manage customer denials of access for removals or for attaining specified clearances:**3.19.1 LIPA:**

Customer Refusals are tracked by each regional LCS. There is no formal tracking program. Each LCS uses various means to track refusals such as Excel spread sheets. The LCS is ultimately responsible to handle and resolve refusals and complaints. The tree contractors who report to the LCS use refusal logs and the contractor General Foremen (GF) meets with customers to resolve non-standard clearance issues. Customers/locations where the GF cannot achieve standard specified LIPA clearances are referred to the appropriate LIPA Regional LCS to resolve. There is not a formal or written procedure or automated central program or database that tracks refusals to completion. For LIPA, it is often difficult to enforce adequate distribution trimming clearance

as there is no clearly established easement. Because preventive maintenance contracts are paid on a firm price per mile, there is an incentive for the contractors to avoid confrontations with property owners over clearances, which helps to limit the number of customer clearance denials that LIPA needs to resolve.

3.19.2 Industry:

Many utilities in the Northeast and throughout the U.S. have a designated process / procedure to track customer pruning refusals to completion. The customer refusal process varies from utility to utility. However, the majority have a written policy or procedure on handling and tracking both customer complaints and refusals. The normal process is to log the refusal with pertinent information (customer name, address, nature of refusal). Normally the first step is to have the contractor general foremen talk with the customer to resolve the refusal. If this is not successful, it is referred back to the utility forester/arborist to pursue. Easements are checked and utility personnel meet with the customer to resolve the issue. If this step fails, other departments within the utility are normally notified (legal, customer service, external affairs or similar groups). The final step is normally to send the customer written notice that the utility has certain rights and on a specified date, crews will be on site to prune the tree(s) in question. A utility representative accompanies the tree crew on the designated day of pruning. In most instances, the utility does not receive a reply from the written notification. Rarely, the customer takes legal action or pursues an injunction on the trimming. Depending on the nature of the complaint and the disposition of the customer, the utility may have local law enforcement present when the pruning is scheduled. Utilities usually have a time limit on resolving these types of issues anywhere from two weeks to 30 days. These refusals are tracked in some fashion, usual via a spread sheet, and reported monthly to senior management. Refusals are taken very seriously and are pursued to completion.

3.19.3 Comparative Summary:

The industry norm is to have a program that records pruning refusals and customer complaints as well as tracking them to completion. LIPA does not have a uniform program of this nature, but the processes vary considerably by area.

3.20 The use of tree guard devices and ability to apply devices with hot sticks:

3.20.1 LIPA:

As needed, tree guards are installed by line crews or trouble crews. Tree contractors do not install tree guard devices.

3.20.2 Industry:

It has been ECI's experience that tree guards, if used, are installed by either utility line crew, trouble crew or contract line crew. Tree crews do not install protective devices with hot sticks. This is a responsibility of the utility.

3.20.3 Comparative Summary:

LIPA follows standard industry practices in regard to installation of tree guards.

3.21 Customer outreach programs with respect to the vegetation management program, including: a. Communication/ notification practices; b) Feedback/survey practices; c) Communication outreach/ education practices:**3.21.1 LIPA:**

Customers are notified two weeks in advance of pruning operations. LIPA sends out a quarterly news publication with articles on trees, tree pruning, safety around trees, etc. LIPA usually has a press release on tree issues about twice a year. LIPA participates in the Arbor Day program at the Planting Fields Arboretum¹⁴. Literature is provided as well as tree planting.

3.21.2 Industry:

The process varies from utility to utility. In most cases notification is supplied two weeks in advance either via a mailed notification or a door card left at the residence. Where work planning is utilized, door cards and personal contact is made and permission for removals secured. In some cases, pruning information is also advertised in local newspapers, bill inserts or on the company web site. Rarely is a face-to-face notification required unless a major change in tree appearance is intended. Almost all utilities have some sort of customer notification process.

It appears that past practice at LIPA has created an expectation among property owners that very little clearance is necessary between trees and conductors. Any change in practice (greater clearances) will require a significant increase in customer outreach prior to tree maintenance.

3.21.3 Comparative Summary:

LIPA is behind the utility industry in public/customer outreach programs related to vegetation management. LIPA has a few such programs, but, lags the industry in this effort. Such outreach programs are often a critical part of a VM programs success. Such programs inform the public on the reasons behind tree pruning and the benefits to be derived from such programs. It provides a source of consistent information on an ongoing basis so that the importance of proper utility line clearance is well known to all LIPA customers. These outreach programs are especially useful in disseminating information particularly if significant changes in VM policies are being instituted.

3.22 Industry comparative review of system reliability performance in the following categories: System Average Interruption Duration Index (SAIDI), System Average Interruption Frequency Index (SAIFI), Customer Average Interruption Duration (CAIDI):

Trees are one of the leading causes of service interruptions at LIPA as at most utilities. In the figures that follow, the reported number of outages by LIPA is presented for comparison along with benchmarking data collected by ECI from other utilities. Data presented excludes major storms. Most utilities in the group do not use a storm exclusion criterion that is as liberal as the LIPA exclusion criteria.

Reliability on the LIPA distribution system receives a beneficial impact from the large amount of covered wire on the system, which helps LIPA avoid many outages that would otherwise occur, especially on 3-phase lines. LIPA has a higher percentage of covered wire than many utilities.

One useful means of comparing the effectiveness of vegetation management programs is on the basis of tree-caused outages per 100 miles. Figure 6 compares LIPA's tree-caused outage frequency to various benchmark indices for primary voltages. LIPA reported an average of 20.4 tree-related outages per 100 miles for the years 2007-2012 (blue column). This places LIPA in about the middle when compared to other similar utilities. This benchmark is somewhat limited, however, since it does not normalize for exposure associated with tree density. Another common metric used to assess the effectiveness of the distribution line clearance program is primary interruptions per 1,000 trees (solid red line in figure 6). The primary tree-related interruptions per 1,000 trees metric relates more directly to outage exposure than does the outages per 100 miles metric.

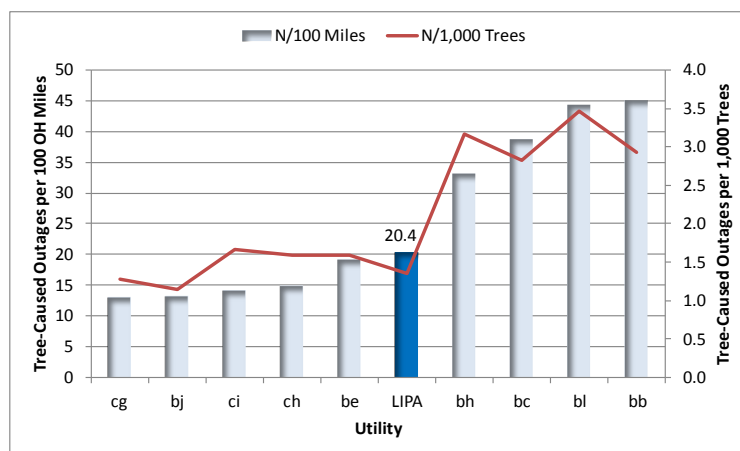

Figure 6. Number (N) of Tree Caused events per 100 Overhead Miles.

Figure 7 presents LIPA's reported interruption (CI) annual average between 2007 and 2012 per 100 OH miles (Blue bar) and per 1,000 trees (red line) based on ECI's projection of tree workload on the primary distribution system as compared to other utilities. LIPA's tree-caused interruption (CI) per 1,000 trees and per 100 OH miles is about the middle of the industry comparison group.

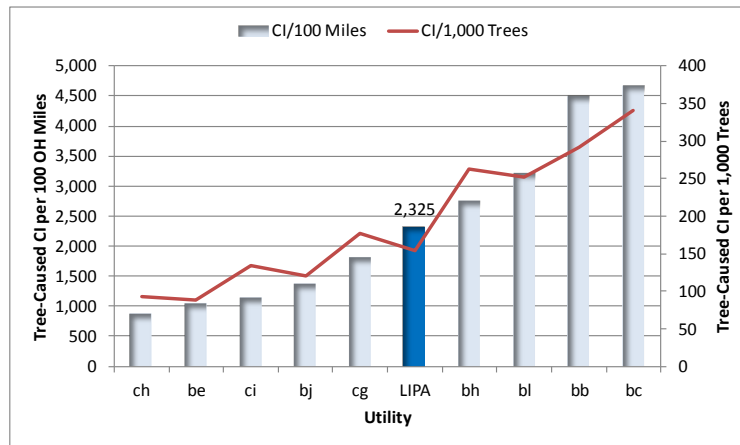

Figure 7. Customers Interrupted (CI) per 100 Overhead Miles.

Figure 8 presents LIPA's customer minutes interrupted due to trees (CMI). This represents the annual average between 2007 and 2012. The blue bar represents the CMI per 100 miles of overhead line miles and the red line represents the CMI per 1,000 trees.

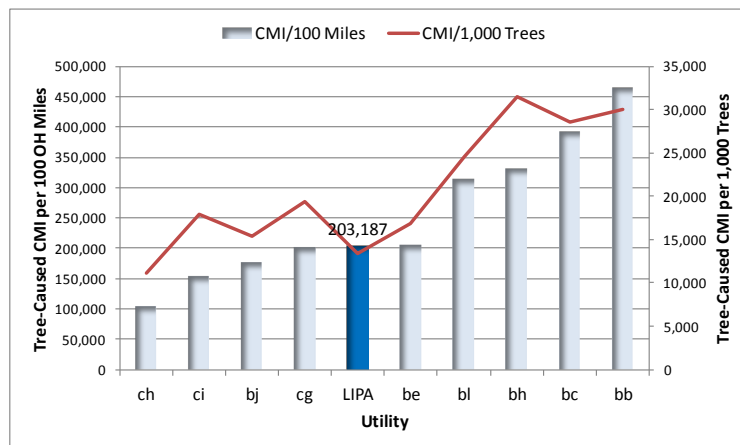

Figure 8. Customer Minutes Interrupted (CMI) per 100 Overhead Miles.

Another common reliability index that provides a measure of utility vegetation management program effectiveness is the tree-caused system average interruption frequency index (SAIFI). Figure 9 summarizes tree SAIFI for LIPA against the benchmark group of utilities. Figure 10 compares LIPA's five-year tree-caused system average interruption duration index (SAIDI) and Figure 11 compares LIPA's tree-caused customer average interruption duration index (CAIDI) to the same benchmark group. LIPA is below the average for the comparative industry norm for SAIFI, SAIDI and CAIDI.

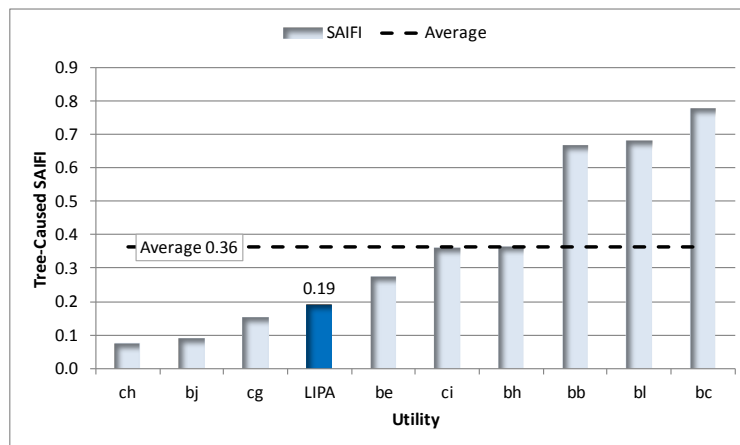

Figure 8. Tree-Caused System Average Interruption Frequency Index (SAIFI).

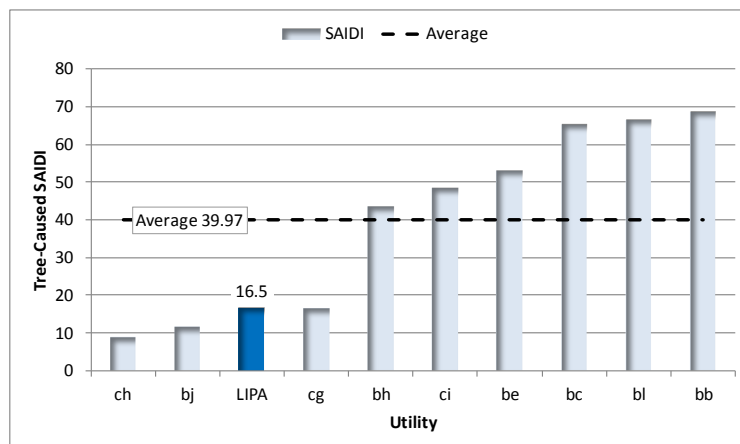

Figure 9. Tree-Caused System Average Interruption Duration Index (SAIDI).

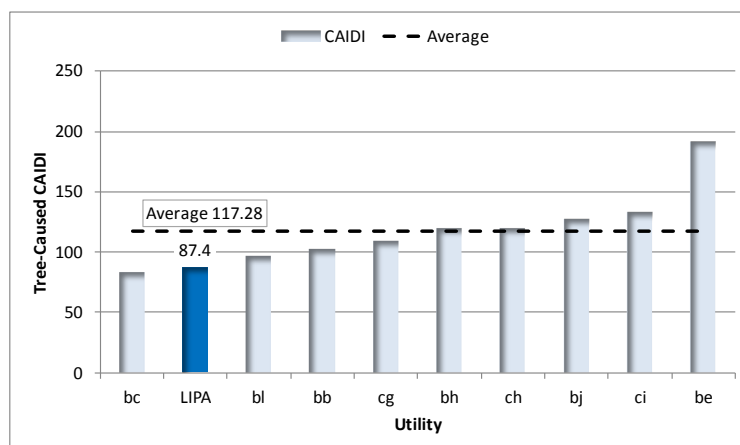

Figure 10. Tree-Caused Customer Average Interruption Duration Index (CAIDI).

3.22.1 Comparative Summary:

LIPA's number of storm-excluded tree-caused events (N), Customers Interrupted (CI) and Customer Minutes Interrupted (CMI) per 100 Overhead Miles are below the industry average in the comparison group of utilities. Tree-caused SAIDI, CAIDI and SAIFI are also below the average for the comparative group of similar utilities.

3.23 General Comparison with Other Utilities

As determined from an earlier ECI study (2005), the LIPA mean system tree density is 151 trees per mile. There were a projected 1,096,000 total trees subject to routine maintenance needs at the time of the study. The statistical error associated with this projection was approximately 9 percent at the 90 percent confidence level.

Figure 12 compares LIPA tree density with the industry by region. As shown, LIPA's tree density of 151 trees per mile is higher than the industry average of 91 trees per mile. LIPA also is above the northeast average of 126 trees per mile. Tree density on the LIPA system was variable and tended to increase in the eastern portions of the system. Utilities with the highest tree densities are located primarily in the northeastern United States.

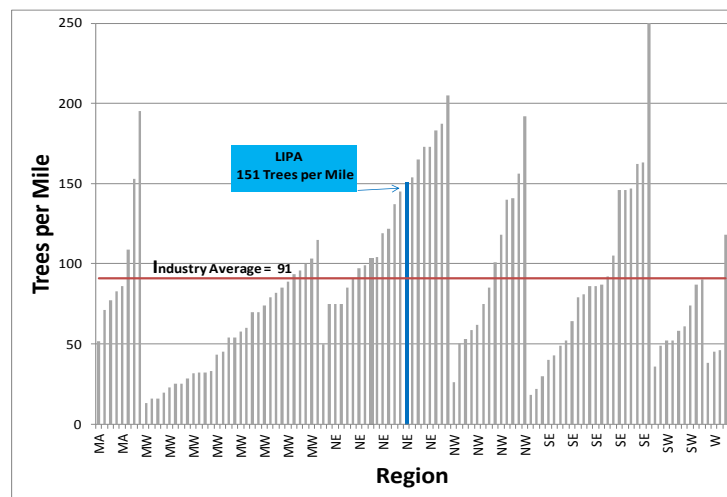

Figure 12. Trees per Overhead Primary Mile, Utilities by Region.

3.23.1 Comparative Summary:

LIPA's tree density is about average for the Northeast, but, much higher than many utilities throughout the rest of the country.

3.24 Cost Efficiencies

An important factor in determining budget requirements is the cost of pruning trees. Figure 13 provides a comparison of various utilities for the hourly rate for a 2-man bucket crew. As can be noted, LIPA's average cost per crew hour in 2013 dollars is the highest of the group of comparable utilities. These billing rates per crew-hour are based on the cost of labor and equipment for the various utilities and are not a reflection of any contracting strategy such as T&M, Firm Price, etc.

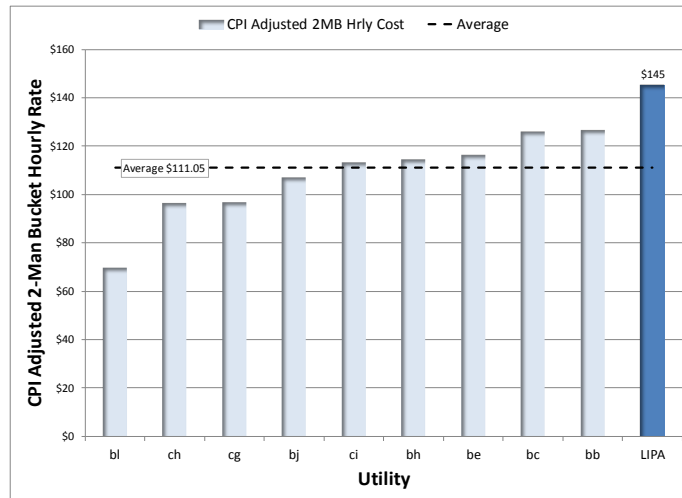

Figure 13. Two-person Bucket Crew Hourly Rate (2013 dollars).

When LIPA average bid costs per mile are normalized and compared to other utilities (Figure 14), LIPA has the lowest cost of the group. Normalization takes into account various factors such as accessibility to a bucket truck, average tree density, urban versus rural work location, and average crew costs. Not accounted for in the normalization of the data is the fact that LIPA clearances are less than other utilities in the comparison group. Given the minimal clearance and low levels of tree and brush removal, LIPA's low normalized cost per mile is understandable.

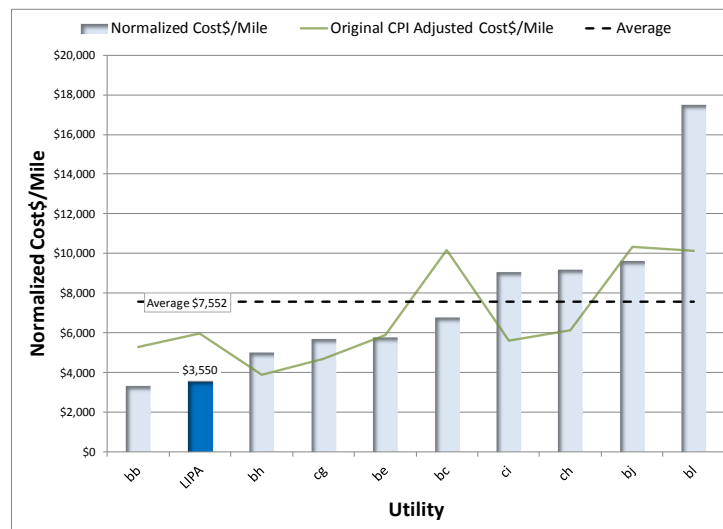

Figure 14. Normalized Cost per Mile. Normalized for Crew Cost, Tree Density, Accessibility, and Urban/Rural Characteristics.

4.2 LIPA Transmission

4.2.1 LIPA Transmission System Assessment

There is no fixed cutoff between transmission and subtransmission and distribution as the voltages ranges tend to overlap somewhat. Typically voltages of 69 kV & 138 kV are considered to be in the lower end of the transmission category (the cutoff for transmission is often indicated at 100 kV) whereas the lower voltage lines of 23 kV and 33 kV are frequently considered to be subtransmission. For purposes of this assessment of the transmission ROW vegetation management practices of LIPA, the overhead transmission system includes all electrical facilities rated at 23 kV and above, which comprises 23 kV, 33 kV, 69 kV and 138 kV lines. It is important to note that the majority of LIPA's transmission lines with voltages of 69 kV and below are not located on a ROW, but, run roadside or in backyards. LIPA does own and operate 345 kV transmission lines but these are all underground facilities and not subject to this review. There appeared to be some lines built to 345 kV line standards operating at 138 kV.¹⁵ The vegetation found within the LIPA transmission ROW and in the immediately adjacent areas to these lines is collectively managed in a similar fashion. Vegetation management policies, strategies, methods, procedures, and practices are uniformly implemented throughout the LIPA transmission system. These transmission lines are all subject to a combination of tree trimming/pruning together with individual large tree removals within and next to the ROW. However, within the confines of the ROW proper, typical vegetation management treatments are performed for purposes of "brush control" i.e., removal of trees in the sapling stage from the floor of the ROW.

4.2.2 Regulatory Environment: New York State (NY PSC)

In 1970, the NYS legislature created one of the first regulatory programs for codifying the determinations in the selecting of new transmission line corridor locations commonly known as Article VII of the Public Service Law. When a proposed transmission facility was approved by the PSC under the auspices of Article VII, a formal Certificate of Environmental Compatibility and Public Need was issued. Following this initial certification, all required environmental measures for these new transmission lines were to be carried out by means of a PSC approved and monitored Environmental Management and Construction Plan (EM&CP). The EM&CP basically built the line on paper; depicting in the plan and profile drawings, tower locations and heights, access roads and stream crossings, clearing and disposal techniques, along with various best management practices (BMP's), restoration procedures, clean-up methods and numerous environmental mitigation measures as detailed contractual requirements. All these specified detailed features were to be implemented throughout all phases of ROW preparation, transmission facility construction, operations and maintenance including long term ROW vegetation management. These EM&CPs from 1970 onward (to this very day) all required that a post-construction long-range ROW vegetation management plan be submitted as an integral part of the EM&CP. LIPA (and previous LILCO) Article VII certificates had these EM&CP requirements for such facility-specific ROW management plans. The PSC staff was then required to review, approve and monitor these ROW management plans throughout the life of the transmission facility. From 1970 to 1980, such plans were the only regulatory mechanism

¹⁵ Such lines (built to 345 kV standards but operating at 138 kV) would exhibit greater line to ground clearances.

available to the PSC to influence the conduct of transmission ROW vegetation management in New York State.

However, in April of 1980, in addition to these EM&CP mandates requiring ROW Plans for each and every transmission line certified under Article VII, the PSC issued Opinion No. 80-15 in Case 27605 that proposed Part 84 regulations on Transmission Facilities Management (requiring Long Range ROW Management Plans and overcoming deferred ROW management practices) and adopted a Statement of Policy on herbicide applications in ROW management. Then on December 15, 1980, Section 84.2 of 16 NYCRR Part 84 was formally adopted in PSC Opinion 80-40, Case 27605, requiring all the investor-owned utilities to develop and submit for PSC approval, their Long-Range Transmission ROW Management Plans for all electric transmission facilities over 34 kV by April 1981.

The former LILCO responded to this PSC order by submitting such a plan which was subsequently approved and monitored by the PSC staff until around 1998. On March 5, 1998, final Federal approval was received for LIPA to take over LILCO. LIPA acquired LILCO's transmission and distribution system in May 1998. Subsequently the PSC made the decision to cease regulating the LIPA transmission system as it was no longer an investor owned utility.¹⁶

Nevertheless, seemingly, the PSC could have continued to regulate the many LIPA transmission facilities that were originally permitted under Article VII much the same as it always has for those Article VII lines built and operated by the New York Power Authority (NYPA). In fact, NYPA has opted to include all their non-Article VII transmission facilities in their most recent "System Wide Long-Range Transmission Right-of-Way Vegetation Management Plan and Program." Currently NYPA, of its own accord, complies with all the standards promulgated under Part 84 of the PSL for the submission of ROW Management Plans and for all other attendant legal notifications and regulatory inspections pursuant to this statute. NYPA does this not only for the lines certified under Article VII but for its entire transmission system. This "beyond compliance" effort by NYPA with regard to transmission ROW vegetation management is an overt endeavor aimed at improving their overall environmental performance by thoroughly comprehending and meeting voluntarily all obligations under these applicable environmental laws and regulations.

On May 5, 1995, the PSC issued proposed revisions to Part 84 Regulations, assigning Case No. 94-M-0101. Subsequent discussions with the then members of the New York Power Pool, other stakeholders, and exchange of comments over the next six years resulted in agreement by the investor-owned utilities to update all existing plans under the current standards including some additional data as provided in additional informal agreements. For instance, the regulated entities were now free to exercise an option to include other transmission facilities less than 34 kV in their regulated plans which heretofore were outside the scope of the Part 84 regulations. National Grid (old Niagara Mohawk) includes all electric sub-transmission down to 23 kV in their System-wide Long Range ROW Management Plan and Program. LILCO (Keyspan) was a party to these initial discussions in Case 94-M-0101 but did not have to update their existing ROW Management Plans due to the creation of LIPA in 1998 and the ensuing policy decision of the PSC not to regulate LIPA's transmission system.

¹⁶ The LIPA Act exempted LIPA from PSC oversight. From the Moreland Commission on Utility Storm Preparation and Response Interim Report dated January 7, 2013

On June 22, 2005 the NY DPS issued Order# 04-E-0822, an “Order Requiring Enhanced Transmission Right-of-Way Management Practices by Electric Utilities.” This order required further revisions to the Transmission ROW Management Plans and annual programs of all the regulated utilities in NYS still coming under the jurisdiction of Part 84. One major new provision of this PSC Order is to be found in ordering paragraph 11: “Any undesirable vegetation rooted within the ROW that in any way encroaches into a priority zone shall be completely removed by each of the utilities to the floor or ground-level of the ROW. Any undesirable vegetation rooted outside of the ROW that in any way encroaches into a priority zone shall be trimmed to the edge of the ROW. Centerline easements, without definite ROW edges, shall be interpreted and applied by the utilities in a manner such that any undesirable vegetation that in any way encroaches into a priority zone is removed completely to the floor. The utilities shall complete this work during a single maintenance cycle (ROW treatment cycle), and not longer. Any request for waiver of these provisions shall be fully justified.”

Seemingly this single provision alone could be interpreted as an immediate requirement to remove virtually all tall-growing vegetation (trees) within all transmission line ROW. This would logically include those trees located in visual vegetative screens developed over time along highways for aesthetic purposes and other large trees purposefully left in dedicated buffer zone areas.

Other provisions of this Order required copious information for each outage in voltage classes 69 kV and above, a new separate report each year on danger tree work performed in the preceding year, and a minimum of one ground and one aerial patrol per ROW per year for all bulk transmission facilities, and for all other ‘critical’ transmission facilities, as defined by the Northeast Power Coordinating Council (NPCC). The PSC further stated that all utilities “shall maintain sufficient qualified staff to implement their respective Commission-approved right-of-way (ROW) management plans” and “shall maintain a minimum level of in-house ROW management personnel, with appropriate education or experience in ROW management, to be thoroughly familiar with all phases of ROW management, including herbicide use. Each utility ROW management plan shall clearly and separately specify the personnel qualifications necessary to accomplish the in-house functions and the functions that may be performed by an outside contractor. The specification of personnel qualifications shall also explicitly address the conditions under which on-the-job training is appropriate.”

LIPA as currently unregulated by the PSC, has not had to comply with any of these new “enhanced ROW management activities” as directed by the PSC and implemented by the other NYS utilities.

However, as a direct result of these new enhanced ROW management requirements, numerous underlying ROW landowners and/or abutment owners located next to or in very close proximity to the ROW when owned in fee by the utility, (particularly in the downstate suburban areas of the Con Edison and O&RU service areas), strongly resisted these massive new tree removals required as per PSC Order. This was particularly prevalent on those ROW where deferred maintenance or minimal trimming was allowed to persist for many years resulting in the continued growth of maturing large trees now occupying sizable portions of the ROW. The PSC staff stated in an open recorded session of the Commission on April 15, 2010 that “complaints have been particularly prevalent in areas that have not been adequately maintained in the past...Unfortunately, some of the utilities have allowed corridors to get overgrown, and as a result of Commission policy they have gone back and reasserted their control over those. So, the

difference between the before and the after picture is pretty marked... certain areas, in particular densely populated suburban areas, we seem to get the highest number of complaints. This is because you have very high bulk transmission lines, very high voltage bulk transmission lines, needed to serve the city running through densely populated areas where people are trying to escape the urban environment. So, basically the right-of-way runs right through people's backyards. These transmission corridors tend to be very close to people's homes, sometimes literally in their backyards. And in some cases the vegetation has been allowed to grow in the transmission corridors serve as effective acoustic and aesthetic barrier between the corridor itself or something else, that diminishes the role and the character of people's homes. It's, therefore, little surprise that people react strongly when the utility removes the vegetation even if the company has every legal right to do so."¹⁷

As a result of the public uproar resulting from the enhanced ROW vegetation mandates, the PSC staff recommended; "that the Commission initiate a formal proceeding to solicit comments from the public, utilities, academia, and other interested parties as to the impacts and effectiveness of our current program, the potential revisions that could be implemented to reduce the impacts while maintaining or even improving its effectiveness." These PSC hearings commenced as Case 10-E-0155 in an Instituting Order issued on April 20, 2010 as to New York State's Electric Utility Transmission Right-of-Way Management Practices. They concluded after substantial public input with a PSC Order Adopting Recommendations; issued and effective on May 27, 2011. The order mandated seven new substantive changes, with the first three only applicable to Con Ed and O&RU due to their high density populations;¹⁸ (1) written notification to affected landowners, (2) specific types of vegetation management work to be performed and other details, (3) provide sections in their ROW Management Plans specifically addressing how they will conduct their ROW management work on high density ROW areas, (4) updates to their websites and any printed materials, detailing the rationales and practices governing their ROW management programs, (5) establish a direct line of communication between the public and the Companies' vegetation management personnel for questions regarding ROW vegetation management work, (6) address the circumstances and criteria pursuant to which replanting is warranted and (7) provide sections in their ROW Management Plans detailing when and where various types of vegetation will be allowed to remain on a ROW. The sections shall incorporate, to the extent possible, a vegetation management approach that recognizes that removal of desirable species is neither required nor preferred.

Most if not all these new regulatory requirements relatively recently promulgated by the PSC could be quite beneficial to LIPA's transmission ROW vegetation management situation in that their service area is very similar in population density and suburban character as the areas covered by both Con Ed and O&RU transmission systems

4.2.3 Regulatory Environment: FERC & NERC and FAC-003

Since the inception of NERC's vegetation management involvement as an outgrowth of the 2003 Northeast Blackout and the passage of the 2005 Energy Act, with NERC being approved as the ERO and the first issuance of Transmission Vegetation Management (TVM) Standards known as

¹⁷ These statements likewise summarize similar social and environmental conditions to be encountered by LIPA on their transmission line ROW throughout most of their service territory.

¹⁸ Once again, this would be directly applicable to LIPA's situation.

FAC-003-0 approved by NERC in February 2005 and effective on April 5, 2005, LIPA has not been burdened with any of these newly formed national TVM standards due to their lack of any overhead lines 200 kV or higher. The following vegetation standard FAC-003-1 (approved by NERC's Board in June of 2006 becoming effective on April 7, 2006 and then became mandatory in the United States on June 18, 2007) had provisions stating that the standard shall apply to all transmission lines operated at 200 kV and above and to any lower voltage lines designated by the RRO (Regional Reliability Organization) as critical to the reliability of the electric system in the region. To date no lines less than 200 kV have been so designated by LIPA's RRO now officially referred to in the latest parlance as the Regional Entities (RE) which for the LIPA is the Northeast Power Coordinating Council (NPCC). The NPCC has not declared a single LIPA line less than 200 kV to be critical. However, the Western Electricity Coordinating Council (WECC) has unilaterally made 100kV their threshold for standards implementation of the Bulk Electric System (BES) with some exceptions. For example, in the past few years (actually since 2006) WECC has routinely reported each vegetation caused outages from lines operating at greater than 100 kV, i.e., including many transmission lines <200 kV.

FERC has, from the very onset of approving NERC reliability standards in 2006 (FERC NOPR dated October 20, 2006), taken exception to NERC's bright-line applicability threshold of 200 kV for the TVM standards in that it might exclude a significant number of transmission lines that could impact Bulk-Power System reliability. Although the RRO's are given discretion to designate lower voltage lines under the TVM standards FAC-003-1, FERC was still concerned that this approach would not result in the inclusion of all transmission lines that could impact Bulk Power System reliability.

FERC staff has also duly noted that allowing a regional reliability organization to define what facilities are included in the BES could result in conflicting definitions -- potentially subjecting or excluding similar facilities from compliance with the Reliability Standards. FERC also pointed out that 25 percent or more of many public utilities' total transmission line miles operate below 100 kV. Yet such facilities may well be as much a part of an entity's portion of the nation's integrated transmission system component of the Bulk-Power System as the transmission facilities operating at or above 100 kV because these lower voltage facilities support the higher voltage facilities. Indeed, it is not unusual to see outages of 69 kV transmission facilities limiting the higher voltage transmission facilities with which they are networked. FERC has consistently interpreted the term "bulk electric system" over the years to apply to all of the > 100 kV transmission systems *and any underlying* transmission system (< 100 kV) that could limit or supplement the operation of the higher voltage transmission systems. It would also include transmission to all significant local distribution systems (but not the distribution system itself), load centers, and transmission connecting generation that supplies electric energy to the system. Accordingly, FERC proposed to direct NERC to change the applicability of FAC-003-1 so that it applies to all the Bulk-Power System transmission lines that have an impact on reliability as determined by the ERO (not the RRO).¹⁹

4.2.4 Bulk Electric System (BES) New Definition

FERC went well beyond just the TVM standards 200 kV bright-line problem when FERC issued a Notice of Proposed Rulemaking (NOPR) on March 18, 2010 directing the NERC to include all

¹⁹ The entire preceding paragraph taken as excerpts from the FERC NOPR Mandatory Reliability Standards for the Bulk-Power System dated October 20, 2006

electric transmission facilities of 100 kilovolts (kV) or more in its definition of what constitutes the “bulk electric system” (BES) subject to mandatory reliability standards under the Energy Policy Act of 2005. This FERC NOPR generally conforms to the current definition of the BES that is recognized by NERC and seven of the eight regional reliability entities around the country (the lone holdout is the NPCC). It would eliminate the discretion that regional entities have to define the transmission facilities that comprise their “BES,” but allow the regional councils to seek NERC and Commission approval if they wish to make variations from the 100 kV standard. FERC Chairman Jon Wellinghoff said at the time this NOPR was issued; “Consumers and the economy depend on smooth operation of a reliable bulk power grid with consistent standards from coast to coast and from cities to rural areas. But without this step, FERC cannot fulfill Congress’ intent to protect the BES.” FERC also notes that there is a strong technical justification for a standard 100 kV threshold: Facilities rated at 115 kV and 138 kV have either caused or contributed to significant BES disturbances and cascading outages. The Feb. 26, 2008, Florida blackout originated from a fault at a facility connected to the 138 kV transmission system and resulted in the loss of 24 transmission lines and 4,300 megawatts of generation associated with 13 power plants and disrupted electric service to more than 3 million customers for several hours.

On November 18, 2010, the NERC was directed to modify its definition of BES by FERC Order No. 743. This Order is intended to ensure that all facilities necessary for the reliable operation of the interconnected electric transmission network are included by a uniform definition and that exemptions are permitted only through a FERC approved process. In FERC's view, the revised definition must: (1) Eliminate the discretion currently afforded to Regional Entities to determine which facilities within their respective regions actually fall under the definition BES, (2) Create a “bright line” threshold that includes any transmission facility operating at 100 kV or higher in the definition of BES except radial transmission facilities serving only load with one transmission source; and (3) Include an exemption process and corresponding criteria by which facilities may be excluded from the definition of BES. However, FERC declined to specify a particular “exemption” process, and instead directed NERC to develop an exemption procedure and file the proposed procedure with FERC. FERC clarified at this time that the 100-kV threshold will not affect thresholds established in individual Reliability Standards (such as FAC-003, which generally applies to facilities 200 kV and higher).

In follow-up reiterating statements found in FERC clarifying Order 743-A (Revision to Electric Reliability Organization Definition of Bulk Electric System) Issued March 17, 2011; Final rule; order on rehearing and clarification; the Commission stated that the NPCC in particular has not made all transmission facilities that could significantly affect reliability subject to the Reliability Standards. FERC noted that NPCC’s use of this discretion has resulted in an impact-based approach to defining the BES that allows significant subjectivity in application and thus creates anomalous results. While NPCC’s use of its discretion brought the problems with the current definition to FERC’s immediate attention, the Commission’s concern is potentially broader because any region could use its discretion to define the BES in a way that leads to similar inconsistent and anomalous results. FERC does have a compelling concern that the subjectivity and lack of ERO and Commission oversight embodied in the current definition could result in the problems identified in the NPCC region occurring in other regions, further supporting adoption of a uniform national BES definition

FERC pointed out that the NPCC material impact assessment has resulted in inconsistent classification of some facilities along and within Regional Entity (RE) borders. For instance,

FERC has previously highlighted the failure of the NPCC test to classify facilities associated with nuclear generation as part of the BES and thus subject to NERC Reliability Standards.

FERC rejected NPCC's material impact assessment due to its subjective language and failure to identify facilities necessary to reliably operate the interconnected transmission system. These flaws include use of the amorphous term "local area," which was not consistently applied throughout the NPCC region. The term local area is simply defined by "the NPCC members," and thus the member-specific subjectivity of the "local area" definition, which ultimately determines whether or not a facility is classified as part of the BES, has led to varying results throughout the NPCC region. The Commission has repeatedly stated that it has serious concerns about NPCC's methodology in regards to designating critical transmission facilities.

FERC emphasized once again that failure of 100-200 kV facilities has caused cascading outages that would have been minimized or prevented if entities were in compliance with the NERC Reliability Standards

The Commission's extensive discussion of the NPCC test further noted that the NPCC methodology is unduly subjective, and results in an inconsistent process that excludes facilities necessary for operating the BES from the definition. Therefore, the Commission indicated, should NERC choose to define the BES using a method other than one employing the 100 kV bright line threshold as the Commission suggested, such an alternative method must be consistent, repeatable and verifiable with supporting technical analysis.

Currently, NERC and the Commission do not have oversight of regional BES classification decisions. If all facilities necessary for reliable operation are not subject to the Reliability Standards, the effectiveness of the Reliability Standards is thus undermined. The Commission has indicated that it did not expect the BES definition Final Rule to result in many additional facilities outside of the NPCC region becoming subject to Reliability Standards; "We reiterate that we do not anticipate a large number of exemption requests arising outside NPCC." In regard to the costs of implementing a 100 kV threshold, the FERC noted that "the burden of our suggested proposal to eliminate the regional discretion in the current definition and maintain a bright-line 100 kV threshold should be minimal in all regions except NPCC.

FERC speculated that in general, "the decision whether, and in what circumstances, to apply an 'exemption' versus 'exclusion process' for radial to load facilities is largely a matter of balancing between, on the one hand, administrative ease, e.g., NERC having to review thousands of exemptions for facilities outside the NPCC region that previously were excluded as radial and, on the other hand, assuring that facilities necessary for operation of an interconnected grid are not inadvertently excluded. FERC has made it abundantly clear that it has granted NERC the discretion to make a determination regarding whether to 'exclude' or 'exempt' radial facilities. One consideration in this regard is whether an "exclusion process" will avoid NERC having to review thousands of "exemptions" for facilities outside the NPCC region that previously were properly excluded as radial.

FERC stated it would also be worthwhile for NERC to consider formalizing the criteria for inclusion of critical facilities in the BES *operated below 100 kV* in developing this exemption process. Underlying this FERC suggestion that NERC consider an inclusion process for critical facilities operated below 100 kV was a concern about ensuring better due process to would-be registered entities found to have potentially critical facilities operated below 100 kV.

On January 25, 2012, NERC submitted two independent but simultaneous petitions to FERC pursuant to the directives in Order No. 743: (1) NERC's proposed revision to the definition of "BES" which includes provisions to include and exclude facilities from the "core" definition and (2) revisions to NERC's Rules of Procedure to add a procedure creating an exception process to classify or de-classify a facility as part of the "BES."²⁰

In their petition to FERC, NERC proposed the following "core" definition of BES: Unless modified by the [inclusion and exclusion] lists, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy." NERC requested that this revised BES definition become effective on the first day of the second calendar quarter after receiving applicable regulatory approval.

NERC states in their petitions that their revised BES definition satisfies the Commission's directives and addresses the technical and policy concerns expressed in both Order Nos. 743 and 743-A. According to NERC, the explicit basis of authority for Regional Entity discretion in the current definition is now eliminated. In addition, NERC states that the core definition establishes specific threshold criteria rather than general guidelines of facilities operated or connected at or above 100 kV. Further, NERC states that "the core definition in combination with the specific inclusions and exclusions provides a detailed set of criteria that can be applied on a uniform, consistent basis across all regions, eliminates ambiguity, and eliminates the potential for discretion and subjectivity in determining what facilities are part of or not part of the BES."

NERC also requested that compliance obligations for all newly-identified elements to be included in the BES based on the revised definition should begin twenty-four months after the applicable effective date of the revised definition. NERC stated that sufficient time is needed to implement transition plans, for exceptions to be filed and processed, for owners of newly-included elements to train their personnel on compliance with the Reliability Standards.

On June 22, 2012 the FERC issued a NOPR for "Revisions to Electric Reliability Organization Definition of BES and Rules of Procedure." In this NOPR the Commission proposes to approve a modification to the currently-effective definition of "BES" developed by the NERC, the FERC-certified Electric Reliability Organization (ERO). The revised NERC definition of "BES" removes language allowing for regional discretion in the currently-effective BES definition. The revised definition also establishes a bright-line threshold that includes all facilities operated at or above 100 kV. The modified definition also identifies specific categories of facilities and configurations as inclusions and exclusions to provide clarity in the definition of "BES." The Commission also proposes to approve: (1) NERC's contemporaneously filed revisions to its Rules of Procedure, which creates an exception procedure to add elements²¹ to, or remove

20 "Exclusion" refers to configurations of elements NERC has identified within the revised definition of BES that should not be included in the BES. In contrast, an "exception" refers to an element that falls within the BES definition but is found not to be necessary for the operation of the grid through the proposed exception process, or an element that falls outside of the BES definition but is found through the exception process should be part of the BES. Thus, an "exception" may result in adding elements to or removing elements from, the definition of BES. Also, note that NERC uses the term "exception" rather than the term "exemption" as used in FERC Order No. 743 and 743-A.

²¹ The current NERC definition and FERC Order No. 743 use the term "facility." NERC proposes to use the term "Element" as used in the NERC Glossary. NERC also explains that, while the current definition includes the phrase "associated equipment," and the revised definition does not, "associated equipment" is included in the revised

elements from, the definition of “BES” on a case-by-case basis; (2) NERC’s proposed form entitled “Detailed Information to Support an Exception Request” that entities will use to support requests for exception from the “BES” definition; and (3) NERC’s proposed implementation plan for the revised “BES” definition.

This FERC issued NOPR also requests comments on a number of issues associated with their proposal to approve the revision to the definition of “BES” developed by NERC as well as an exception process to include or exclude specific elements in the definition of “BES” on a case-by-case basis. For example, in developing an estimate of the new reporting burden associated with the advent of new information collection and retention requirements projected due to the inclusion of additional new elements (i.e., new heretofore formerly excluded transmission facilities), FERC assumes, as does NERC, that some registered entities in the NPCC Region will be most affected, with a lesser affect in all other regions.

On December 20, 2012 FERC issued Order No.773 Final Rule “Revisions to Electric Reliability Organization Definition of BES and Rules of Procedure” in which FERC approved modifications to the definition of “BES” as developed by the NERC. The Commission finds that the modified definition of “BES” removes language allowing for regional discretion in the currently-effective BES definition and establishes a bright-line threshold that includes all facilities operated at or above 100 kV. The modified definition also identifies specific categories of facilities and configurations as inclusions and exclusions to provide clarity in the definition of “BES” elements and the establishment of an exception process for facilities that are not necessary for operating the interconnected transmission network. In this Final Rule, the Commission also approves: (1) NERC’s revisions to its Rules of Procedure, which create an exception process to add elements to, or remove elements from, the definition of “BES” on a case-by-case basis; (2) NERC’s form entitled “Detailed Information to Support an Exception Request” that entities will use to support requests for exception from the “BES” definition; and (3) NERC’s implementation plan for the revised “BES” definition including NERC’s proposal of a twenty-four month time period after these rules established to accommodate their implementation plan.

FERC stated that NERC’s proposal provides additional clarity and granularity that will allow for greater transparency and consistency in the identification of elements and facilities that make up the BES. FERC found that any entity that believes its facility is improperly classified as part of the BES by application of the new BES definition may avail itself of the exception process to have the facility removed from inclusion in the definition. FERC further noted NERC already applies a general 100 kV threshold, and today all regions, with the exception of NPCC, also apply a 100 kV threshold. While cost of implementation can be relevant in Commission review of a proposed Reliability Standard, the foremost concern is the reliability of the interconnected transmission network.

The Commission found “that many facilities operated at 100 kV and above have a significant effect on the overall functioning of the grid and that the majority of 100 kV and above facilities in the United States operate in parallel with other high voltage and extra high voltage facilities, interconnect significant amounts of generation sources and operate as part of a defined

definition by the use of the term “Transmission Elements.” NERC defines “Elements” as, “any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components.”

flowgate.” The Commission explained that this “illustrates their parallel nature and therefore their necessity to the reliable operation of the interconnected transmission system” and that “[p]arallel facilities operated at 100-200 kV will experience similar loading as higher voltage parallel facilities at any given time and the lower voltage facilities will be relied upon during contingency scenarios.”

On April 18, 2013 FERC issued yet another Order No. 773-A involving the “Revisions to Electric Reliability Organization Definition of Bulk Electric System and Rules of Procedure “as the Final Rule” Order on Rehearing and Clarifications. In this latest order in this long series (going back to FERC Order 693 issued on March 16, 2007) the Commission denies rehearing in part, grants rehearing in part and otherwise reaffirms its determinations in Order No. 773. In addition, the Commission clarifies certain provisions of the Final Rule. FERC reiterated and clarified that elements that are newly-included in the BES due to the revised definition will only become subject to relevant Reliability Standards twenty-four months after the effective date of the revised definition. (Although FAC-003-1 was specifically mentioned (and it was the only NERC reliability standard ever mentioned) as a possible exemption in earlier FERC notices (e.g., the FERC NOPR in 2010) there was no request by NERC nor mention by FERC whatsoever of the TVM standard (or any of the hundreds of other NERC reliability standards) being exempted from the new BES definition and all its ensuing ramifications in any of the later approval documents issued either by NERC or FERC.

As NERC had previously requested and FERC approved, the revised BES definition would become effective on the first day of the second calendar quarter after receiving applicable regulatory approval, or, in those jurisdictions where no regulatory approval is required, on the first day of the second calendar quarter after its adoption by the NERC Board of Trustees. FERC Order No. 773, although issued by the Commission on December 20, 2012, was not published in the Federal Register until January 4, 2013. The Final Rule and all its attendant regulations and other requirements would thereby become effective 60 days thereafter, or on March 5, 2013. Thus, the first day of the second calendar quarter after March 5 is July 1, 2013 which is the effective date of the new BES definition. Consequently, the 24-month NERC implementation phase will expire (24 months later) on July 1, 2015.

For most of the issues considered by FERC in Order 773-A, the Commission denied the request for rehearing or additional clarification and affirmed/confirmed the findings in the Final Rule and/or otherwise reaffirms its determinations in Order No. 773 with two exceptions; one a rehearing and the other an extensive clarification.

FERC granted rehearing to the extent that, “we direct NERC to modify the exclusions to ensure that generator interconnection facilities at or above 100 kV connected to BES generators identified in inclusion I2 are not excluded from the BES. If NERC chooses to propose a different solution, it must demonstrate that its proposal is equally effective or efficient to ensure that generator interconnection facilities that connect generators included in the BES to the grid, and that are at or above 100 kV, are included in the BES and must support any alternate proposal with a technical analysis sufficient for the Commission to make an informed decision.”

As to issues related to the exception process and the Commission making local distribution determinations. The Commission believes that entities misconstrue the function of the NERC exception process and the Commission’s local distribution determinations. Accordingly, FERC reiterated and expanded on those functions as follows.

The two processes are separate, not concurrent and will be used for different determinations. In the Final Rule, the Commission found that “NERC’s case-by-case exceptions process is appropriate to determine the technical issue of whether facilities are part of the BES” and that “the jurisdictional question of whether facilities are used in local distribution should be decided by the Commission.”

The Commission stated in the Final Rule that applying the definition and its exclusions is not necessarily the end of the inquiry, as the Commission ultimately determines whether facilities are used in local distribution and thus excluded from the BES. Thus, if an entity believes its facility is a local distribution facility but after applying the BES definition including inclusions and exclusions the facility is not excluded, the entity may apply to the Commission to determine whether the facility is used for local distribution. Thus, the Final Rule contemplates two separate and distinct processes and does not direct entities to seek an exception from NERC before seeking a local distribution determination from the Commission.

On April 30, 2013 NERC made an “Update Announcement” concerning their new BES Process Implementation Plan. This announcement to all registered entities noted that both NERC and the Regional Entities are finalizing development of the processes, information technology tools and related guidance to assist industry in the implementation of the newly revised BES definition approved by the FERC in their Order Nos. 773 and 773-A. The guidance documents, processes and tools are designed to provide industry with certainty and clarity about the implementation of this revised BES definition, i.e., this recently updated definition establishes a bright-line threshold that now includes all facilities operated at or above 100 kV, which becomes effective on July 1, 2013. NERC concluded that “The refinements in the revised BES definition provide clarity for what is anticipated to be a limited number of situations and is expected to result in a limited number of assets being removed from the current definition of the BES.”

From all this we may readily glean that there exists the distinct possibility that in due time the BES ‘bright-line’ definition of including all facilities at or above 100 kV will take precedence over the TVM standards and their current 200kV cut off. Hence we may see all of LIPA’s 138kV lines to be included in the BES definition and thus by default come under the jurisdiction of all NERC reliability standards. Moreover, with the new ‘inclusion process’ for lines under 100kV and then FERC being able to make a separate determination as to what is in the distribution system (and what is not), the critical importance of many 69kV lines to the integrity of the LIPA Transmission System will perhaps dictate that even some of these sub 100kV lines should be included in the BES and thus subject to all the NERC reliability standards as well. This circumstance of having numerous new (less than 100kV) lines included within the BES definition is even more likely when considering FERC’s frequent references to the inadequacy of the NPCC determinations of what to include as critical transmission facilities (FERC: “the major impact of this new definition will be minor except in the NPCC area”) as well as the many other FERC examples of lines under 100kV being necessary for the reliability of the Bulk Power System.

4.2.5 Transmission Vegetation Management Standard FAC-003-1 & Revision

FERC has from the very onset of the NERC reliability standards approval process in 2006 also been very concerned about how the FAC-003-1, standard imposes such a limited applicability due to the bright-line threshold of 200 kV included in its provisions that will exclude a significant number of transmission lines that could impact Bulk-Power System reliability.

Although the regional reliability organizations were given discretion to designate lower voltage lines under the TVM Reliability Standard FAC-003-1, FERC always questioned that this approach will not result in the inclusion of all transmission lines that could impact Bulk Power System reliability. Accordingly, the Commission proposed to direct NERC to change the applicability of FAC-003-1 so that it applies to Bulk-Power System transmission lines that have an impact upon reliability as determined by the ERO. (NOPR Mandatory Reliability Standards for the Bulk-Power System issued on October 20, 2006)

However, as stated explicitly in FERC Order 693 issued on March 16, 2007; “We (FERC) will not direct NERC to submit a modification to the general limitation on applicability as proposed in the NOPR. However, we will require the ERO to address the proposed modification through its Reliability Standards development process. As explained in the NOPR, the Commission is concerned that the bright-line applicability threshold of 200 kV will exclude a significant number of transmission lines that could impact Bulk-Power System reliability. Although the regional reliability organizations are given discretion to designate lower voltage lines under the proposed Reliability Standard, none have designated any operationally significant lines even though there are lower voltage lines involving the Interconnection Reliability Operating Limit (IROL). We continue to be concerned that this approach will not prospectively result in the inclusion of all transmission lines that could impact Bulk-Power System reliability. In proposing to require the ERO to modify the Reliability Standard to apply to Bulk-Power System transmission lines that have an impact on reliability as determined by the ERO, we did not intend to make this Reliability Standard applicable to fewer facilities than it currently is with the 200 kV bright line applicability, but to extend the applicability to lower voltage facilities that have an impact on reliability. We support the suggestions by others to limit applicability to lower voltage lines associated with IROL and these suggestions should be part of the input to the Reliability Standards development process.”

NERC began the Reliability Standards development process in a very timely manner for the revision of the Transmission Vegetation Standards FAC-003-1 by approving a Standards Authorization Request (SAR) for initial posting on January 11, 2007 well before the final FERC Order on March 16, 2007 was issued. In early 2007 NERC convened a standard drafting team (SDT) and began the struggle with several technical issues over the next four years. After numerous drafts and even the unprecedented development of a “White Paper” or “Technical Reference” that was intended to provide supplemental information and guidance for complying with the newly developed requirements of Reliability Standard FAC-003-2 and also as a supporting document that provides additional explanatory background to the requirements of the Standard.

After numerous drafting reiterations, false starts and member voting delays NERC finally submitted a petition to FERC for their approval almost five years later of the newly revised Reliability Standard FAC-003-2 Transmission Vegetation Management on December 21, 2011. NERC noted in their petition to FERC for approval of the proposed TVM Standard FAC-003-2 that the resolution of the issue of applicability (i.e., the bright line threshold of 200 kV) in particular, was appropriately developed through their Reliability Standards development process. The first draft of the standard proposed to assign the selection of sub-200kV lines to the Reliability Coordinator (rather than the Regional Reliability Organization, as was specified in version 1 of the standard). However, with the third draft, specific criteria based on the importance of sub-200kV lines were proposed to replace the discretion of the Reliability Coordinator, effectively creating a “bright line” for those facilities operated below 200kV.

Industry was asked to comment on these proposals through the standard development process, and their subsequent balloting indicates support for this approach.

NERC believes this to be a superior approach to the previous standard, as it has eliminated the previous “fill-in-the-blank” discretion of the Regional Reliability Organization and now focuses instead on specific criteria to determine the applicability to all sub-200kV facilities that are identified as an either; (1) an element of the Interconnection Reliability Operating Limit (IROL) or (2) also extends the applicability to address issues specific to the Western Interconnection. The applicability of lines operated below 200kV has thus been limited to those specific cases where lines are critical to reliability by virtue of their being elements included in the determination of an (“IROL”) or a part of a Major WECC Transfer Path. Hence, the newly revised TVM standard (FAC-003-2) does not create a new minimum bright-line threshold of 100kV as does the new FERC definition of BES. By virtue of relying on IROL and the Major WECC Transfer Path identification as a proxy for reliability importance, the proposed TVM standard now uses an impact-based approach (which ironically was also the same approach that the NPCC used that was rejected by FERC for the BES definition) for determining applicability. The proposition to grant authority to the Regional Entity to determine applicability was considered and was ultimately rejected in favor of the use of the IROL and Major WECC Transfer Path identification criteria.

NERC also notes that they were directed by FERC to develop an acceptable definition that covers all applicable facilities that impact reliability but balances extending the applicability of this standard against unreasonably increasing the burden on transmission owners. NERC is confident that the proposed FAC-003-2 includes a sufficiently detailed and specific description of the applicability relative to facilities lower than 200 kV. Criteria used in the applicability test focus on the criticality of lines to reliability by virtue of their being elements included in the determination of an IROL or a part of a Major WECC Transfer Path. As the applicability of this proposed Reliability Standard is definitely being expanded, NERC noted that the Commission should allow flexibility in the timeliness for full compliance with this Reliability Standard for these newly included lower-voltage facilities, or allow such lower-voltage facilities a one-year grace period before the Reliability Standard is implemented. NERC has considered these concerns as to the effective date of the newly implemented TVM standards when determining when it would request that the modification of this Reliability Standard to go into effect. The NERC Implementation Plan for the proposed standard makes the recommendation that the standard should become effective on the first calendar day of the first calendar quarter one year after the date of the order approving the standard.

FERC issued a NOPR on October 18, 2012 for approving the NERC revisions to their proposed Reliability Standard for TVM as specified in their petition. FERC noted that the newly submitted Reliability Standard FAC-003-2 has a number of features that make it an improvement over the Version 1 standard in accordance with their directives in Order No. 693. For example, like Version 1, the proposed TVM Reliability Standard would apply to all overhead transmission lines operated at or above 200 kV, but unlike Version 1, it would explicitly apply to any lower voltage overhead transmission line that is either an element of an Interconnection Reliability Operating Limit (IROL) or an element of a Major WECC Transfer Path.²² FERC stated that this

²² NERC defines “IROL” as “[a] System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System.” NERC defines “System Operating Limit” as “[t]he value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most

is a new class of transmission lines not previously required to comply with the former TVM Standard (FAC-003-1).

Although FERC duly noted that the proposed Reliability Standard will enhance reliability by also requiring sub-200 kV transmission lines that are elements of an IROL or Major WECC Transfer Path to fully comply with its requirements, it would still seek further comment on how NERC will ensure that IROLs are properly designated.

While FERC viewed the modified applicability by NERC to include sub 200 kV lines as a significant improvement, there are two aspects on which they will seek additional comments. First, section 4.2.2 of proposed FAC-003-2 provides that the standard applies to overhead transmission lines operated below 200 kV identified as an IROL under NERC Standard FAC-014 by the planning coordinator. However, FAC-014-2 does not explicitly require the planning coordinator to provide information about IROL status to transmission owners. Further, IROLs may change with changing system conditions. Given these factors, FERC seeks a better understanding of how FAC-003-2 will be applied to facilities designated as IROLs. For example, FERC seeks comment on how information regarding IROL status will be transmitted to transmission owners that must comply with FAC-003-2 and how transmission owners can effectively implement vegetation management per FAC-003-2 given that such programs are generally implemented annually and a change in IROL status can take place at any time given changing system conditions.²³

Second, in Order No. 693, the Commission directed that the proposed Reliability Standard apply to “Bulk-Power System transmission lines that have an impact on reliability as determined by the ERO.” The Commission noted evidence that some lines below 200 kV can have significant impacts on the Bulk-Power System, including IROLs and System Operating Limits (SOLs). The Commission directed the ERO, however, to balance extending the applicability of the standard against unreasonably increasing the burden on transmission owners. FERC solicited comments on how the applicability of the proposed Reliability Standard complies with the directive that the standard includes all “lines that have an impact on reliability.” In addition, since the issuance of Order No. 693, FERC note that Commission staff and NERC stated in their joint report on the 2011 Southwest outage that failure to properly designate IROLs was a major cause of the outage. Therefore, as part of the broader inquiry into whether the standard covers “lines that have an impact on reliability,” FERC seeks comment on how NERC will assure that IROLs are properly designated.

Moreover, FERC stated that “transmission lines not designated as an IROL element (or the equivalent) have been instrumental in causing major blackouts, including the August 2003 Northeast blackout. In that case, at least three of the four 345 kV lines (Star-S Canton, Harding-Chamberlin, and Hanna-Juniper) that tripped due to tree contact were not monitored as a flowgate, which could be viewed as the technical equivalent of an IROL at that time. These three

limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria.” See NERC Glossary of Terms Used in Reliability Standards (NERC Glossary) at 26, 48. The Western Electric Coordinating Council maintains a listing of Major WECC Transfer Paths, available at <http://www.wecc.biz/Standards/Development/WECC-0091/Shared Documents/WECC-0091 Table Major Paths 4-28-08.doc>.

23 For example, if a line is designated to be an IROL element by the planning coordinator, how will the transmission owner know to thereafter apply FAC-003-2 to that line? If the designation of an IROL changes with changes in system conditions, how will a transmission owner document management of vegetation over time?

lines were the second, third and fourth lines to trip. Likewise, an August 10, 1996 blackout in WECC began with the trip of a 500 kV line (due to a tree contact) that was not identified as part of WECC's relevant path catalog at the time, i.e., the line was not identified as one of the critical paths subject to WECC monitoring and oversight similar to that required for a Major WECC Transfer Path today."

According to FERC in its NOPR, NERC asserted that it has addressed the concerns in applying the TVM standard only to transmission lines that are 200 kV or above. NERC noted that it has addressed that concern (and related directives) by extending the applicability of the proposed standard to overhead transmission lines that are either 200 kV and above, or less than 200 kV if the line is an element of an IROL or a Major WECC Transfer Path. FERC believes that NERC has supported its approach to the expansion in applicability, noting that FAC-003-2 provides specific criteria to determine applicability for sub-200 kV transmission lines. As stated by FERC in its NOPR, "NERC has used an impact-based approach for determining applicability rather than a bright-line threshold as a means of balancing the potential increased burden on transmission owners under a standard with expanded applicability." In addition, NERC explains that it has developed an appropriate implementation plan for any new lines covered by the standard, thereby satisfying the Commission's directive to consider a delayed implementation date if lower-voltage facilities are included. NERC has requested as an effective date for the Reliability Standard, "the first day of the first calendar quarter that is twelve months following the effective date of a Final Rule in this docket." NERC has further requested the retirement of the Version 1 standard concurrent with the effective date of FAC-003-2.

FERC stated its belief that all these beneficial provisions support its proposal to approve FAC-003-2. FERC also noted that industry has made important strides in reducing the instances of vegetation contact; "We believe that the revised FAC-003 standard we propose to approve in this rulemaking, together with a continued focus by industry on best practices for vegetation management, will serve to enhance the reliability of the Bulk-Power System." In considering whether to approve Reliability Standard FAC-003-2, FERC acknowledged that it gave due weight to NERC's technical expertise. Thus, FERC announced based on the overall benefits of proposed FAC-003-2 that the Commission proposes to approve Reliability Standard FAC-003-2.

NERC provided comments on December 21, 2012 in regard to FERC's Notice of Proposed Rulemaking ("NOPR") concerning Reliability Standard FAC-003-2 (Transmission Vegetation Management) issued on October 18, 2012. In their NOPR, the FERC requested a better understanding of how proposed FAC-003-2 will be applied to facilities designated as Interconnection Reliability Operating Limits (IROLs). Specifically, FERC had stated that proposed FAC-003-2 provides that the standard applies to overhead transmission lines operated below 200 kV identified as an IROL under NERC Standard FAC-014 by the planning coordinator. However, it was FERC's interpretation of FAC-014-2 that it does not explicitly require the planning coordinator to provide information about IROL status to transmission owners (TOs). Further, IROLs may change (be added or deleted) with changing system conditions.

NERC responded to this FERC contention in their comments by noting that their technical reference document prepared for providing guidance to the proposed FAC-003-2 explains the approach taken to rely on their current standard FAC-014 for identification of IROLs by the Planning Coordinator. FAC-014 also requires Reliability Coordinators, Planning Coordinators, and Transmission Planners to have a methodology to identify all lines that might comprise an

IROL. Thus, Planning Coordinators are able to identify sub-200 kV lines that qualify as part of an IROL and should be subject to proposed FAC-003-2. This would include identifying any changes in the status of a line if a line's IROL status changes given changing system conditions.

On March 21, 2013 FERC issued Order 777 as their Final Rule approving the Revisions to the Reliability Standard for Transmission Vegetation Management (FAC-003-2). This FERC Order determined to adopt their NOPR proposal and approve Reliability Standard FAC-003-2, including the associated definitions and implementation plan, as just, reasonable, not unduly discriminatory or preferential, and in the public interest. FERC found that FAC-003-2 is an improvement over the currently-effective Version 1 TVM standard, will support vegetation management practices that can effectively protect against vegetation-related transmission outages, and satisfies a number of the outstanding directives from Order No. 693. FERC also found that NERC has explained how many of the new requirements improve upon the currently-effective Version 1 TVM standard. In accordance with FERC directives in Order No. 693, NERC has expanded the applicability of the TVM Reliability Standard so that it now applies not only to all overhead transmission lines operated above 200 kV, but also to transmission lines operated *below* 200 kV if they are an element of an IROL or an element of a Major WECC Transfer Path. Once approved, these Reliability Standards may be enforced by the ERO (NERC) subject to FERC oversight or by FERC independently.

Consistent with FERC Order No. 693, NERC has properly modified the applicability of FAC-003-2 to include transmission lines that have an impact on reliability while balancing the extension of the applicability of the standard against unreasonably increasing the burden on TOs. Rather than employing a bright-line threshold of 100 kV, the NERC standard drafting team chose to limit sub-200 kV applicability to "specific cases where lines are critical to reliability by virtue of their inclusion as elements in the determination of an IROL or a part of a Major WECC Transfer Path." NERC states that, by relying on IROL and Major WECC Transfer Path identification as a "proxy" for reliability importance, FAC-003-2 uses an "impact-based approach" for determining applicability.

In response to FERC's NOPR question regarding how NERC will assure that IROLs are properly designated in light of the 2011 Southwest Outage, NERC had stated that it will continue to enforce the appropriate standards (FAC-014 and FAC-010) to ensure that planning coordinators identify IROLs using their developed methodology. NERC also states that efforts are underway to implement recommendations of the Outage Report addressing the failure to properly designate IROLs. FERC agreed that they are satisfied with NERC's explanation.

FERC noted that some entities also identify seasonal IROLs and it expects any sub-200 kV elements (transmission facilities) of seasonal IROLs to be likewise subject to FAC-003-2. FERC believes that this approach provides consistency and predictability in identifying all the sub-200 kV transmission lines that are now subject to compliance with FAC-003-2.

It was further revealed by FERC that this Reliability Standard is not designed to address severe weather events and natural disasters such as the October 2011 Northeast snowstorm, or for example Hurricanes Irene (2011) or Sandy (2012). However, some commenter's pointed out that more clearly defined clearance requirements and stricter vegetation management practices as now required due to the approval of FAC-003-2 should have the attendant benefit of reducing the risk to Bulk-Power System reliability during such severe weather events.

However, FERC still remains concerned regarding how IROL status of a transmission facility will be communicated to the TO. FERC was not persuaded by the NERC contentions that Reliability Standard FAC-014 requires the communication of IROL status information to every transmission owner. Hence, FERC did direct NERC to develop a specific means to assure that all IROLs are directly communicated to TOs in a timely manner. But, FERC did state that NERC should establish a clearly defined communication structure to assure that IROLs and changes to IROL status are timely communicated to all TOs. This structure will better support compliance with the extended applicability of FAC-003-2 to sub-200 kV transmission lines that are an element of an IROL. However, FERC will leave it to NERC to determine the most appropriate means for communicating IROL status to TOs.

FERC does not believe, however, that establishing a communication structure should delay the implementation of FAC-003-2. As NERC indicates, the ultimate responsibility for compliance with FAC-003-2 is upon TOs. Moreover, it appears that there are multiple avenues for TOs to obtain information about IROL elements on their transmission facilities. For example, NERC represents that, in many instances, the entity responsible for identifying IROL elements on a system is also registered as a TO. Likewise, TOs may obtain the necessary information through voluntary communications or pursuant to coordination required in bilateral agreements. FAC-003-2 includes an effective date that is twelve months after the date a line operated below 200 kV is initially designated as an element of an IROL, which allows time for the TO to modify its vegetation management work plan to include the new IROL elements. FERC encourages NERC to inform them when it has developed means for communication of IROLs to all TOs to help ensure they receive notice of each of their applicable lines before the standard becomes effective.

FERC's Final Rule, Order No. 777 approving an updated NERC Reliability Standard, FAC-003-2, regarding vegetation management along transmission lines will become effective on May 28, 2013 (i.e., 60 days after its March 28, 2013 publication in the Federal Register). The standard itself, FAC-003-2 becomes effective on "the first calendar day of the first calendar quarter one year after the date of the order approving the standard" (i.e., July 1, 2014).

As late as April 24, 2013 NERC submitted some errata to FERC on FAC-003-2 issues unrelated to this applicability discussion.

4.2.6 ROW Vegetation Management Research & Development

Another established method to keep abreast of all regulatory and other technical and even scientific (e.g., ecological) issues pertaining to transmission ROW vegetation management is to actively participate in research programs dedicated to this particular field of endeavor. LIPA predecessor was an active participant in the ROW vegetation management research program conducted by the now defunct (circa 1998) Empire State Electric Energy Research Corporation (ESEERCO) for about 25 years. Subsequently, the Electric Power Research Institute (EPRI), a national research organization that conducts electric research on behalf of and is primarily funded by electric utilities, amicably subsumed the ESEERCO ROW research program in 1998. Although LIPA was an early active member of this 'new' EPRI Research Program in its formative stages it has not been a member for many years now.

Today EPRI has a vigorous ongoing ROW vegetation management research program that focuses on providing information and tools, e.g., best management practices, to electric utility ROW managers for the cost-effective conduct of ROW vegetation management through their completion of numerous R&D project reports only available to its active (paying) membership.

Their 'T&D and ROW Environmental Issues - Program 51' research target provides a plethora of material and facts necessary for the efficient and economical management of ROW vegetation management that has become increasingly essential for compliance with the new mandatory and enforceable NERC reliability TVM standards. In addition, EPRI provides its member companies with T&D facilities methodologies to protect sensitive species and habitats during ROW construction and maintenance activities. EPRI's collaborative R&D program which leverages the funding provided by its many members, helps contain and even lower ROW vegetation management costs while maintaining high reliability and enhancing environmental productivity, sustainability and stewardship that are all so vital to the competitive success of the modern electric utility company.

LIPA should consider participating, once again, in EPRI's ROW Vegetation Management Research Program 51 to fully realize the many tangible benefits of membership; being able to retrieve instantly numerous ROW management research project reports from EPRI's large portfolio of completed projects and then through their ongoing contributions to this research program, as an active member, LIPA will then be able to assist EPRI and the other participants in developing new R&D projects that can be further tailored to suit the specific ROW issues and vegetation management problems found on Long Island.

4.2.7 Retention of Eastern Red Cedar (*Juniperus virginiana*)

Eastern red-cedar (*Juniperus virginiana*) is a dense slow-growing coniferous evergreen species of tree native to Eastern and Central North America. The eastern red-cedar has a moderate growth rate and the U.S. Forest Service reports that on average this species expresses a growth rate of approximately 7 inches to 1.5 foot per year. At age 10 red-cedar trees are around 15 feet tall, at age 20 they are about 25 feet tall and at about 30-35 years of age trees are usually only about 30-35 feet tall. Mature trees aged 50 are often found to be 40 to 45 feet tall though they may ultimately, after many years of growth, reach heights to be in excess of 120 feet tall. Their very nominal growth rate seems to slow considerably after the first 30 years of a specimen's life. Eastern red-cedar is the most widely distributed conifer of tree size in the Eastern United States. It is a pioneer invader, which means it is among the first plant species to occupy abandoned fields and cleared areas or otherwise repopulate disturbed land. It is unusually long lived among such pioneer species, with the potential to live many hundreds of years. It has a tendency to dominate the landscape which can create management challenges. The low branches and wide base occupy a significant portion of land area. The thick evergreen foliage blocks out most sunlight, so few plants can live under their dense thick canopy that often persists to ground level.

In addition, eastern red-cedar can be important to wildlife when found mixed in proper juxtaposition with other species. As an evergreen, it provides good nesting and year-round roosting cover for many birds. The oftentimes dense eastern red-cedar thickets provide good cover for deer, and the abundant foliage, although low in nutritional quality, provides emergency food for them during times of stress usually in the winter season. Fruits are high in crude fat and crude fiber, moderate in calcium, and very high in total carbohydrates. Eastern red-cedar fruits are eaten by many wildlife species, including rabbits, foxes, raccoons, skunks, opossums, and coyotes and are an important winter food for many birds which disperse the wingless seeds such as waxwings,²⁴ bobwhite quail, ruffed grouse, pheasant, wild turkeys, Fruits that are eaten by

²⁴ It takes about 12 minutes for their seeds to pass through the birds' guts, and seeds that have been consumed by this bird have levels of germination roughly three times higher than those of seeds the birds did not eat.

birds and other animals are important vectors for their seed dissemination. Seeds that pass through animal digestive tracts and those that remain on the ground beneath the trees may germinate the first or second spring. Seedling reproduction is best where the hardwood competition has been completely removed.

Normally, these eastern red-cedar trees because of their ultimate height growth potential would be listed as an undesirable tall growing target trees species quite capable of eventually breaching the wire security zone resulting in a flashover causing a line to ground fault that would take the line out of service. However, due to its slow and quite methodical growth rate (it is not subject to growth spurts due to exceptional good growing conditions), the eastern red-cedar is often left on the ROW by many utilities as a 'temporary' desirable cover, particularly in locations along the border of the ROW or within ROW sites having a high conductor clearances (e.g., over ravines, near roads, close to support structures, etc.) which would allow these very slow growing species decades of growth before needing to be removed. Their dense cover also helps preclude the establishment of the much faster growing hardwood tree species.

When these eastern red-cedar trees are found in relatively low numbers on transmission line ROW and in situations less prone to public view their timely individual removal is often easily accomplished during a normal treatment cycle. However, in situations like those found on Long Island that have high landscape values attached to virtually all large trees their removal can become problematic. Also, because by the time these now mature trees are required to be removed they are so large and bushy that they usually require special and more costly handling of the woody residues, e.g., removal/disposal off the ROW.

Another Northeastern transmission owner had allowed red-cedar to grow within their ROW for many years and only removed them on a case by case basis once they became too tall and were a potential contact to the lines. As the number of tall red-cedars kept increasing over time eventually this TO determined that their wholesale removal (all eastern red-cedar trees over 8 feet in height) was required in the wire zone as they had now become just too numerous and problematic for the safe and reliable operation of their transmission system.²⁵ The public outcry with this attempt at large scale tree removals brought their state Public Utility Commission (PUC) into the fray. The public (ROW land owners and nearby residents) and the PUC suggested that trimming the trees should suffice but the company countered that these trees were now so numerous and tall that this option was too costly and now too dangerous (worker safety issues from operating buckets within the wire security zone to selectively trim cedars) as well. The PUC determined that public hearings were needed and requested the TO to submit more detailed information as to the need for the removal of all eastern red-cedar trees from the wire zone of the ROW. The TO provided copious amounts of information, hired an outside consultant and made numerous photos available to the PUC.

In addition to the oft repeated line reliability (line to ground faults via the trees) and public safety (localized high voltage electrical discharges) issues and the worker safety concerns in attempting to trim (in reality actually topping the trees) the Transmission Owner revealed a number of other unique issues that demonstrated the need for the red-cedar tree removal. Vines can grow up into these red-cedar stems and once they have reached the tip of the tree can continue to grow a few more feet up into the air thus in effect adding height (an additional few feet) to the tree in a very short (a few weeks at most) timeframe. When a tree is already just outside of the wire security

²⁵ The new NERC TVM Standard FAC-003-1 was given as the primary reason.

zone this extra few feet could be sufficient to allow an arc (electrical discharge) from the line to the vine and down the tree to the ground resulting in a line to ground fault. These eastern red-cedar trees are also now so abundant and tall that their very presence on the ROW now impairs the ability to do visual inspections of the lines from the ground.

The eastern red-cedar trees also contain substantial amounts of volatile oils that make it very flammable under the right conditions. Recent research has indicated that the presence of abundant red-cedar poses a safety hazard in residential areas due in large part to these volatile oils that burn rapidly and at high temperatures which consequently increase the fire risk substantially. The increase in abundance of red-cedar within the areas where humans interact with environment has resulted in a potential increase of catastrophic wildfires. Educating rural and suburban interface residents about red-cedars and their increased risk to wildfire is a real challenge. Many homeowners who appreciate the greenery and believe that "all trees are good" do not recognize the increased fire risk from these highly flammable trees growing near them. (Zhang and Hiziroglu, 2010).²⁶ In addition, even a single red-cedar catching on fire in the ROW wire zone could itself caused a line to ground fault through the flames.

The PUC finally relented and allowed this TO to perform the necessary tree removals on a limited scheduled basis whereby the worst offenders (trees closest to the conductors) were removed first along with all the eastern red-cedar saplings under 6 feet in height. Over time the remaining trees could be removed from the wire zone of the ROW. The Long Island suburban environment poses similar, if not even more acute problems to any large scale removal of such a conspicuous evergreen tree as the eastern red-cedar in that many people view these trees as an agreeable addition to the local landscaping whether on their own property or on lands adjacent to them. Hence, LIPA should take careful notice of this former self-inflicted predicament by a TO and carefully reconsider the necessity to purposefully leave eastern red-cedars "carte-blanche" on their entire transmission ROW system.

4.2.8 Wire Zone Border Zone (WZ/BZ)

Many TOs across the country declare that they apply the WZ/BZ approach to the management of vegetation on their transmission line ROW. The WZ/BZ is a technique or perhaps better described as an applied philosophy or set of principles that takes a two tiered approach to zoning the ROW for defining what actually constitutes desirable vegetation based on line clearances and the height of various plant species. It is a site explicit way of dividing the ROW width into three distinct management zones from edge to edge: the border zone, the central wire zone, and another border zone (see Figure 15). In this classical WZ/BZ approach,²⁷ the ROW vegetation is managed differently in the two basic zones, purportedly to optimize the safe and reliable transmission of electricity in an enhanced environmentally compatible manner. The wire zone is the section of a utility transmission ROW directly under the wires and extending outward about 10 feet or more (actual distance is a function of voltage; higher voltage lines require greater distances out from the conductor enlarging the wire zone area) on each side. The wire zone is managed to promote a low-growing plant community dominated by grasses and herbs (defined

²⁶ Zhang, Difei and Hiziroglu, Salim. Impact assessment and utilization of eastern redcedar. American Journal of Applied Sciences. August, 2010. http://findarticles.com/p/articles/mi_7109/is_8_7/ai_n55104973/

²⁷ As depicted in Annex A of the ANSI A300 Part 7-2006 Integrated Vegetation Management standards and the 2007 BMPs for IVM by the International Society Arboriculture.

by some practitioners to be less than 3 feet in height at maturity which eliminates practically all shrubs). The border zone is the remainder of the ROW outside the wire zone (see Figure 15A). The two outer border zone units are then ostensibly managed to establish taller herbaceous vegetation (> 3 feet in height) and including virtually all woody shrubs with even some very short stature trees that will only grow to less than 25 feet in height at maturity.

Modifications to this basically sound concept were needed mainly because the oft used schematic depiction of a BZ/WZ transmission line ROW (with the two outer border zones and the central wire zone as drawn only in cross-section) is such an oversimplified (see Figure 15B) and so out of proportion to real-world conditions coupled to the fact that ROW vegetation is actually managed in three-dimensions (not just two) together with the quite unnecessary exclusion of all desirable vegetation over three feet in height. Thus the NYS electric utilities use a highly 'modified' approach to the WZ/BZ²⁸ concept that is much more realistic in application and promotes a more ecologically sound (diverse and stable) vegetation community

LIPA has two very real difficulties in attempting to apply even the most basic WZ/BZ concept to their own TVM program. First is the fact that their ROW are so very narrow and constrained to begin with that the established border zones would be relegated to a very small portion (a thin strip) along-side the outer edge of the ROW. By default the central wire zone would now encompass the great majority of the entire ROW inhibiting the degree of the intended values in the WZ/BZ application and thus negating many of its alleged benefits. The other snag stems from the need for LIPA to routinely trim back all side branches and protruding limbs from the adjacent forest wall along the outside edge of their ROW. In order to accomplish this side trimming in an economical manner it is most often desirous to allow bucket trucks to gain ready access to both side-edges of the ROW. Thus instead of allowing woody shrubs and short stature trees to flourish in this remnant border zone, LIPA regularly needs to completely mow this border zone area to effectively remove all the taller more robust woody vegetation that would otherwise obstruct the passage of these large vehicles (bucket trucks) from moving along the entire outside edge of the ROW unimpeded. This routine mowing together with the subsequent soil scarification caused by the bucket trucks actually facilitates many trees seedlings to become well established along the outside ROW edges and then grow unrestrained by any competing lower growing desirable vegetation. In a few years these sites will then need more mowing once again when the ROW edge trees requires further trimming. Hence at this time it not reasonable to expect that LIPA could begin any time soon to implement the WZ/BZ concept in any meaningful way.

²⁸ See attached paper: New Diagrams and Applications for the Wire Zone–Border Zone Approach to Vegetation Management on Electric Transmission Line Rights-of-Way by Ballard, McLoughlin, and Nowak in the Journal of Arboriculture & Urban Forestry 2007. 33(6):435–439

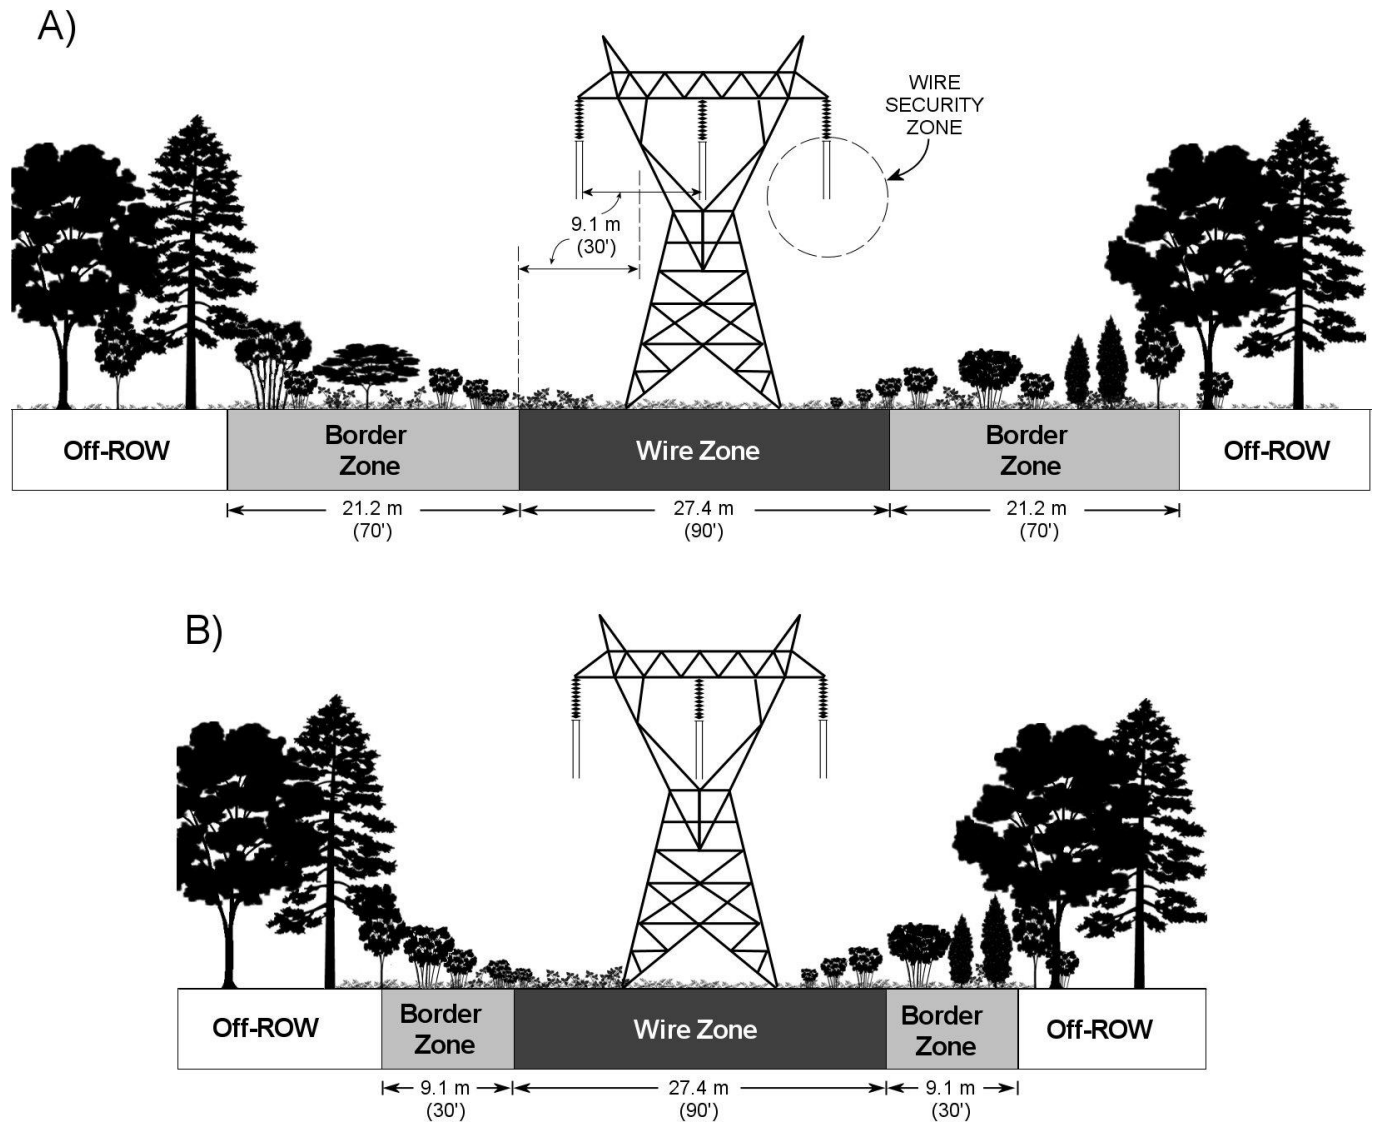

Figure 15. Classical vs. Modified Depiction of the WZ/BZ Concept.

4.2.9 LIPA's Implementation of Integrated Vegetation Management

In 1994 LIPA, as its predecessor LILCO, was one of the eight original signatories to the New York Power Pool's (NYPP) Position Paper "APPLICATIONS OF INTEGRATED PEST MANAGEMENT TO ELECTRIC UTILITY RIGHTS-OF-WAY VEGETATION MANAGEMENT IN NEW YORK STATE." Later as LIPA, it again signed on in 2002 to the revised and updated version of this 'white paper' now issued under the aegis of the Environmental Energy Alliance of New York (EEANY). By signing both these documents LIPA basically agreed with the concepts of IPM as originally developed for agricultural pest

management but now applied to TVM with the new acronym of integrated vegetation management (IVM). This derivative of IPM, IVM, now focused on the selective (and highly discriminate) removal of all pests from the ROW, i.e., the targeted undesirable tall growing species (mainly trees) that are capable reaching heights that would otherwise breach the wire security zone. IVM also consisted of concurrently practicing the overt retention and fostering of all the lower growing desirable compatible species found naturally within the ROW environs. These newly formed low-growing (often tightly knit-dense) ROW plant communities primarily comprised of early successional/sun-loving woody shrubs and vines, all herbaceous plants including the forbs, various grasses, sedges, rushes, and reeds along with ferns and related fern allies such as horsetails and club mosses will then all act collectively to inhibit the growth of the trees making future ROW maintenance efforts less intensive and intrusive as well as much more economic (fewer trees to control).

In NYS, IVM was the outgrowth of regulatory orders first by the PSC to selectively manage ROW vegetation by removing (most often by the discriminating application of herbicides) only those species whose growth characteristics made them intolerable to occupy the ROW environs over their lifespan. Later the NYS Department of Environmental Conservation (DEC) along with the Governor's Office via Executive Orders required that IPM be used by all state affiliated entities (which included all regulated utilities and Power Authority's). The melding of these two interlocking state directives became the basis for the establishment of IVM by the NYS electric utilities in the mid to late 1980's for the singular management of vegetation within electric transmission line ROW.

One of the necessary tools for the implementation of IVM is the continued selective application of herbicides, albeit very much reduced in quantity as time goes by and the tall growing species density (number of tree stems) systematically falls to very low levels after a number of ROW treatment cycles. When any hardwood sapling is cut or mowed, the undisturbed root system will activate a wounding hormone that then promotes rapid and sustained levels of vegetative regrowth that attempts to recapture the tree's lost above ground biomass (usually the decapitated stem-canopy). Thus from the stump will come multiple sprouts (growing many times faster than a seedling due to the root reserves) that emerge from both dormant buds on the uncut portion of the remaining stem and from growth potential areas in the root collar zone just below the soil surface. In some hardwood species such as aspen, pin cherry and black locust, the tree will not only sprout from the cut stump area but also anywhere from along the entire root system which may be some distance from the severed stem. A single cut stump can often regenerate multiple stems (5-10) but a tree species that can root sucker as well can produce many dozens to even hundreds of stems encircling the area around the cut stump. One particularly problematic root suckering ROW target tree species that LIPA has in abundance, *Ailanthus* or tree-of-heaven, is actually a highly invasive alien or exotic plant species that poses a very real ecological threat to all native plants and wildlife habitats. It is to be discouraged and conceivably even eradicated from all sites both on and off the ROW.

Today LIPA vigorously pursues various appropriate IVM treatments on a sizable portion of their transmission ROW when and wherever they are able to manage vegetation from the floor of the ROW and then only upon those sections of ROW that are fee owned. However, only about 650 acres of LIPA ROW are amenable to the application of IVM with herbicides through such fee ownership.²⁹ Although the principle objective of IVM is to establish low growing plant

²⁹ About 1300 acres of LIPA transmission system is fee-owned or about two-thirds.

communities over the entire ROW so that future TVM efforts can be substantially reduced it is virtually impossible to eliminate trees completely everywhere from slowly gaining a foothold within the ROW due to the pressures of natural succession (trees are the normal climax vegetation cover type for most of Long Island particularly so due to the elimination of wildfire) as well as the proximity of the nearby plentiful seed sources (i.e., mature forests found just off the ROW). Hence in order to really practice IVM one must always use some herbicides, e.g., ever spot treatments, to insure control of the future vegetative reproduction that will readily occur when all hardwood trees are only physically cut either manually e.g., with a chain-saw or mechanically e.g., mowed. LIPA has purposefully chosen not to attempt the application of any herbicides on their easement ROW due in large part to the notification provisions required by state law as specified in NYS DEC Part 325 Regulations and NY Environmental Law Section 33-0905

The overall results of LIPA's deployment of IVM using herbicides in a highly discriminate manner on their fee owned lands is a diverse ROW condition now containing numerous low growing sun-loving early successional plant species that dominate the vegetative coverage with just a relatively few target tree stems able to grow up through these dense thickets of desirable plant communities that have become firmly established. This highly sought after end product of IVM (dense low growing ROW plant communities) is particularly noticeable in the critical central wire zone of the ROW where the vegetation is left undisturbed as compared to the outside edge of the ROW that is often subject to repeated trampling/mowing for LIPA's customary ROW edge tree trimming activities. Many treatment cycles of attentive IVM performed by LIPA on these select fee owned ROW have resulted in a very good overall ROW condition with the limited number of target tree species being routinely removed well prior to their becoming a significant threat to the reliability of the facilities. This is the goal of IVM; a ROW situation requiring minimum maintenance with high reliability together with the establishment and preservation of highly diverse plant communities found throughout the ROW environs.

LIPA has attempted to practice some of the basic tenets of IVM on sections of their easement ROW that do not involve any use of herbicides whatsoever. These efforts have met with some limited success. Through some selective mowing of thickets of scrub oak (a very desirable ROW plant cover type) LIPA has created a ROW condition that has allowed this desirable woody shrub species to proliferate (to grow very dense) through the very same vegetative reproduction capacity that is so undesirable in the more tall growing species of trees. After such a mowing, repeated selective hand cutting of target trees³⁰ that still have the ability to grow up through the scrub oak are then manually cut with chainsaws. The density of the scrub oak does help retard the growth of these undesirable tree species somewhat, e.g., particularly pitch pine. Hence over time (a number of s) these sections of ROW become primarily filled with this desirable plant cover (scrub oak) that only needs occasional selective tree sapling removal from the stump sprouts and some root suckering that still occurs.

The rationale provided by LIPA for curtailing all IVM efforts involving the use of herbicides on a sizable portion of their remaining 1300 acres of transmission ROW is that these ROW not fee owned and are under easements. Once herbicides are contemplated for use on such easement

³⁰ It should be noted that the application of a minuscule quantity of herbicide to just the outer ring of the freshly cut stump surface would suffice to control all future stump and/or root suckering.

ROW then notification³¹ of all the underlying fee owners must be made well prior to their application. This open announcement of herbicide usage on LIPA's easement ROW might then lead to public objection and draw unwanted notice and potential disapproval to their entire TVM program. This concern would be very true if LIPA ever attempted a widespread system-wide notice of herbicide usage for all their ROW easements. However, a program to slowly implement IVM (employing the selective use of herbicides) on their ROW easements might be successful if implemented cautiously and properly over time. This gradual implementation of IVM using herbicides upon those ROW segments controlled by LIPA easements could be accomplished in stages with appropriately delivered communication efforts together with effective educational materials. This could occur first to only those select ROW landowners deemed more willing to accommodate LIPA's proposed TVM requests for IVM applications involving the selective use of herbicides. If IVM with the selective application of herbicides is successfully implemented on just a few properties then others could be contacted for their concurrence.

4.2.10 Control of Invasive Plants and IVM: An Opportunity for LIPA

As has been noted, LIPA does not use any herbicides on ROW that only have easements due to the legal requirement to formally notify the underlying fee owner about such herbicides usage well in advance of the scheduled treatments. There are also about 650 additional acres of fee owned ROW some of which might also be amenable to some forms of selective herbicide applications. This total lack of any herbicide applications precludes performing most types of truly efficacious IVM in that the only alternative to remove the threat of tall growing trees on the ROW is to trim/prune which is truly a very short-term control technique or physically remove trees by cutting or mowing. Such physical removal methods for all hardwood species of trees will result in abundant vegetative reproduction, i.e., multiple stump sprouts and in some case even more prolific root suckers.

On such easement ROW where LIPA has repeatedly removed trees physically there also exists in some locales numerous non-native tree species that are often referred to as alien or exotic plant species. When an exotic plant species begins to flourish and increase in abundance they then can become termed an invasive species. When invasive species become so very common in an area, they are then often referred to as 'naturalized' plant species. These alien plant species that are tagged as invasive have a propensity to experience explosive population when first introduced into new areas of suitable, uninfected habitat. Such invasive plant species because of their ever-increasing nature can then readily become a threat to the stability of the natural ecosystems they occupy by crowding out native plant species and altering in a negative manner the habitat required for many indigenous species of birds and wildlife. The native plant and animal species affected by the presence of invasive aliens can often include those officially listed as endangered or threatened or otherwise noted as rare or protected. According to the National Park Service (NPS) the "spread of these invasive plants is a leading cause of environmental despoliation and loss of biological diversity worldwide."³²

³¹ These pesticide notification requirements are found under a combination of NYS DEC Part 325 Regulations for Commercial Lawn Care Applications and the NY Environmental Law Section 33-0905; NY Code Pesticide Applicator Certification..

³² National Park Service & U.S. Fish and Wildlife Service. Plant Invaders of Mid-Atlantic Natural Areas, 4th ed. (2010)

Many concerned environmental groups, members of academia as well as state regulatory agencies have now become involved with efforts to thwart this spread of invasive species³³ One of the most prominent invasive tree species on Long Island was already mentioned, tree-of-heaven or *Ailanthus*. However, other invasive tree species that have also become common on LIPA ROW include the Bradford (Callery) Pear, Norway maple, black locust, European or black alder and even some tall growing species of bamboo.³⁴ Some invasive species are also classified as tall shrubs and may be a problem to the LIPA transmission system in locations of low conductor clearances. These include the closely related species of Russian (to 30 feet tall) and autumn (to 20 feet tall) olive, common buckthorn (to 30 feet), and European cranberry (to 15 feet).

With the only effective control of many of these invasive species being the selective application of herbicides, there may be an opportunity to work together with these environmental groups and willing landowners to combat the spread of these numerous invasive plants that are likewise tall growing trees and shrubs that are in need of removal from the ROW in any event. While engaged in the removal of the invasive plant species other tall growing trees could also be treated simultaneously.

The control of invasive plant species has likewise been termed “Integrated Vegetation Management or IVM for short by most practitioners of invasive plant control.³⁵ LIPA as part of its ROW inventory should determine how many of their transmission ROW acres are actually infested with invasive tree and tall shrub species and then begin forming partnerships with the various Invasive species control groups such as the Nature Conservancy in the Long Island Invasive Species Management Area (LIISMA). LIISMA is a voluntary partnership of over 50 organizations from the geographic area that includes Staten Island (Richmond County), Long Island (Kings [Brooklyn], Queens, Nassau and Suffolk counties), and eleven additional coastal plain islands. Their mission is to help conserve LIISMA's biodiversity, wildlife habitat, recreation resources, scenic quality, and crop production, while protecting human health and safety, by facilitating cooperation and coordination among land owners and managers to reduce the threat of human-introduced invasive species. LIISMA also believes it can reduce the costs of invasive species management by preventing and eradicating new invasive species infestations before they become well established. LIISMA brings together representatives from more than 50

³³ New York Invasive Species Clearinghouse is funded with New York State Environmental Protection Fund resources through a contract with the New York State Department of Environmental Conservation. NYISC was established in response to a recommendation of the November 2005 report of the New York State Invasive Species Task Force to the Governor and Legislature. The Task Force recommended that the State should integrate invasive species databases and information clearinghouses. This resulted in the creation of the Clearinghouse. The Clearinghouse is authorized and overseen by the New York State Invasive Species Council, which is co-chaired by the New York State Departments of Environmental Conservation and Agriculture and Markets. Cornell Cooperative Extension and Sea Grant are also cosponsors.

³⁴ May 3, 2013: CBS News, New York: Malverne has joined a growing crop of municipalities on Long Island and beyond in banning bamboo. Growers can soon face \$350 fines per week or even 15 days in jail if the bamboo keeps growing. There is a 30-day grace period for homeowners to remove their outdoor bamboo plants.

³⁵ As stated by the US Forest Service in regards to the control of invasive plant species; “this is a scientifically based strategy that provides a broad framework for Integrated Vegetation Management (IVM) of exotic tree infestations. Preventing the continued spread of these infestations, controlling existing infestations, and maintaining and improving the health of native plant communities are the ultimate goals of this strategy. The various adverse environmental, social, and economic consequences associated with the outbreaks are significant, and they will only continue to increase without direct intervention.”

government agencies, non-profits, and private businesses to discuss, share and learn from each other the latest invasive strategies and issues and builds partnerships and facilitates coordination among stakeholders.

PSEG Long Island
Case Name: PSEG LI - Rate Case 2015
Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-TDP-0111
Date of Response: 03/06/2015
Witness: TD BUDGET AND OPERATIONS

Question:

Provide the following including any work papers as needed:
Gross annual transmission vegetation management cost for each of the last five years.

Attachments Provided Herewith: 1

DPS-TDP_0111_PSEG LI Tree Trim Acts Bud 2011- 2014 Final.pdf

Response:

PSEG LI became the service provider effective January 1, 2014. For the years 2011, 2012 and 2013 to the best of our knowledge the numbers provided in this response are based on input from departmental spread sheets supported by numbers from National Grid. Information for 2010 is not available.

Costs for the core transmission trim/ sideline clearance and tree removals (within the associated line clearance zone) for the last five years are as follows:

2011- \$1.53 million, 2012- \$1.79 million, 2013- \$1.95 million, and 2014- \$2.70 million

Hazard Tree/Storm Hardening Tree Removals was established as a separate budget by LIPA/ National Grid to remediate trees posing a risk from outside the line clearance zone to both the Transmission and Distribution system. Before 2015, T&D hazard tree/limb removals costs were in a single budget:

2011- \$1.78 million, 2012- \$3.07 million, 2013- \$1.84 million, and 2014- \$2.99 million

Typically 20% to 40% of this spending is for Transmission hazard tree removals based upon the field risks identified. Prior to 2015 the transmission and distribution costs associated with storm hardening/hazardous tree removal were not differentiated by transmission and distribution but were combined as one account.

Please see the attached spreadsheet.

Veg Mgt Budget- Actuals: National Grid 2011, 2012 & 2013, PSEG-LI - 2014

	2011		2012		2013*		2014	
	Budget	Actuals	Budget	Actuals	Budget	Actuals	Budget	Actuals (YE Frst as of 2-13-15)
Distribution Circuit Trim & Removals	\$ 9,456,439	\$ 9,554,341	\$ 9,463,042	\$ 10,663,936	\$ 9,746,933	\$ 10,499,738	\$ 23,700,000	\$ 19,701,913

Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-TDP-0157
Date of Response: 03/10/2015
Witness: TD BUDGET AND OPERATIONS

Question:

For each cost element of labor and non-labor where the percent increase from 2015 to 2016 is greater than 25%, please describe the basis for the change and how the forecast level was derived, particularly since there is no change in FTEs.

Attachments Provided Herewith: 6

Substation Maintenance Transition Plan.pdf
TDP 25 percent IR_F.xlsx
Poles.xlsx
T and D 2015 IT Project Descriptions.docx
Pole Inspections.pptx
Substation Maintenance Transition Plan.xlsx

Response:

Overall, for items that have an increase of 25% or more from 2015 to 2016, the increase is due to the following activities:

- Tree trim
- Inside and outside plant maintenance
- Pole inspection
- Systems maintenance and upgrade.

In the case of the activities mentioned, which are largely carried out by contractors, a change in FTEs would not be anticipated. See the attached excel file called "TDP 25 percent IR.xlsx" for the differences and explanation of the differences greater than 25%. Also attached are supporting documents for the increases for the above activities. Additional documents, which contain confidential salary information and/or competitive bidding information, are exempt from disclosure on grounds of personal privacy and confidential commercial information, and are being submitted to the DPS Records Access Officer with a request for confidential treatment. Additional relevant information has been or is being provided in response to Requests DPS-TDP-193 and DPS-TDP-234.

Response to Discovery Request: DPS-TDP-0169
Date of Response: 03/18/2015
Witness: TD BUDGET AND OPERATIONS

Question:

a. Provide in Excel format, the Budgeted and Actual Historical Costs for the last 5 years (2010 - 2014) as well as the 2015 through 2018 forecasts by activity. The following breakdown can be used as a basis.

Program 2010 2011 2018
Budget Actual Budget Actual Budget
Distribution Circuit Trim
Transmission Circuit Trim
Storm Hardening/ Hazard Tree
Customer Support
ROW/Substation Maintenance
TOTAL

b. For each of the activity areas used in response, provide a summary of the work performed and indicate whether the activity is Transmission only, Distribution only, or a combination of both.
c. Include any related work papers.

Attachments Provided Herewith: 1

DPS-TDP_0169_PSEG LI Tree Trim Acts Bud 2011- 2014- Bud 2015-2018.pdf

Response:

a. See attached excel spreadsheet "PSEG LI Tree Trim Acts Bud 2011-2014 – Bud 2015-2018".
b. A summary of the work performed is as follows:

Distribution Circuit Trim: The distribution circuit trim is the primary vehicle for reducing vegetation-caused interruptions for the distribution electric system. PSEG LI is bringing the distribution system onto a 4-year cycle, significantly expanding the line clearance (PSEG-LI adopted best industry practice line clearance of trimming to 8' side, 10' below, 12' above primary conductors (300% increase by volume over previous specs)), and utilizing an asset management based model for circuit trim selection.

Transmission Circuit Trim: The transmission circuit trim is the primary vehicle for reducing vegetation-caused interruptions and trips for the critical, bulk power Transmission electric system. Tree trimming spec has been increased to 25' for 138kV conductors (all other

transmission trim is trimmed to 18' clearance). PSEG LI is bringing the transmission system onto a four year cycle (or trimming 250 miles per year).

Storm Hardening / Hazard Tree: Storm hardening identifies and removes hazardous trees and limbs located outside the normal trim clearance zone and removes high rate hazard trees, especially in the transmission bulk power corridors (i.e., Newbridge Road to Ruland Road) or distribution three phase main (higher criticality than fused taps).

Customer Support and Operations Support: Supports requests from external and internal LIPA/ PSEG-LI customers. Typical external requests result from customer calls (including municipalities) indicating that they wish to remove a tree in close proximity to our power lines. Per the NYS High Voltage Proximity act, the utility must insure that only a trimmer who is certified to work within 10' of high voltage lines do so. Therefore in response to these requests, our VM contractors will trim or "make safe for removal" to provide safe clearance for private contractors to remove the balance of tree. The VM Ops support program provides tree trim or removal support at the request of Operations (i.e. Electric Service) where vegetation is suspected of causing repeat interruptions and the circuit is not scheduled for circuit trim in the coming year (i.e. "hot spot trimming").

ROW/Substation Maintenance: ROW Maintenance includes, among other things, mowing of Rights of Way, brush hogging, herbicide applications, debris removal, barriers and fencing. Substation Maintenance includes mowing of substations and herbicide applications. The maintenance program for substations and rights of way is managed by a Senior Forester/Horticulturist who oversees crews in all maintenance activities and interfaces with the public in landscaping efforts and public education initiatives.

- c. See response to (a) above. Note that data for items prior to January 1, 2014 were provided by National Grid, which was the service provider during that period.

NOTES:

(1) All National Grid figures (2011-2013) based upon Veg. Mgt. department records (not official National Grid finance)

(2) FY 2013 Actuals - \$4.841 million omitted from this analysis as costs relate to Premium Payments for Services Rendered in 2012 in Response to Hurricane Sandy

(3) FY 2013 Actuals - \$2.400 million omitted from this analysis as costs relate to Special Debris Removal for accelerated circuit trim

(4) For the most part Transmission Circuit Trim is trimming >13kV lines, if underbuilt Distribution that will be trimmed at that time. The opposite scenario is performed the same way.

2015-2018 program totals do not include internal labor& associated costs, administration, support contractors or undeclared storm vegetation management expense (not listed in this format)

PSEG Long Island
Case Name: PSEG LI - Rate Case 2015
Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-TDP-0183
Date of Response: 03/13/2015
Witness: TD BUDGET AND OPERATIONS
Confidential work papers attached.

Question:

The T&D Budget and Operation Panel on page 18, states, “Additionally, the group administers the Verizon/LIPA Joint Use Pole Agreement for approximately 560,000 poles in the LIPA service territory.”

- a. Of approximately 560,000 poles in the LIPA service territory, how many poles will be inspected by: (1) the Company or its contractor, (2) Verizon, and (3) Other utilities/entities?
- b. Provide a detailed description of how the results of the inspection are maintained/managed and who is responsible for these actions. Include any variations due to joint ownership or other conditions.

Attachments Provided Herewith: 2

DPS-TDP_0183_Pole Parity Verizon LIPA.pdf

DPS-TDP_0183_2015_Distribution_Pole_Inspection_data.pdf

Response:

- a. Please see attached PDF (Pole Parity Verizon LIPA) regarding pole ownership. Approximately 56.5% of the 560,000 poles in the service area are LIPA owned and will be inspected by LIPA’s contractor, OSMOSE. Verizon is responsible for the inspection of poles in which they maintain ownership. All poles located in FEMA mitigation zones will be inspected by one of LIPA’s FEMA contractors.
- b. Poles scheduled for inspection are issued to LIPA’s contractor, sorted by circuit, using a database extracted (sample attached) from the EGIS mapping database. The results of the OSMOSE inspections are returned in an expanded format of the data base which indicates the findings from their inspections. Reliability Management reviews this list for deteriorated poles in need of replacement, trussing or re-inspection. Poles requiring replacement are forwarded to Distribution Design for evaluation of any special requirements before being issued to PSEG LI Construction or a contractor for replacement. The spreadsheet detailing the results of the inspections is forwarded to Mapping for inclusion in the EGIS database. Poles which can be trussed to extend their useful life are forwarded to a contractor to be worked on.

PSEG Long Island
Case Name: PSEG LI - Rate Case 2015
Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-TDP-0189
Date of Response: 03/11/2015
Witness: TD BUDGET AND OPERATIONS

Question:

The T&D Budget and Operation Panel testimony on page 38 stated, "Again, due to the need to maintain a rate freeze in 2015, pole inspection funding had been constrained. A higher level of pole inspections, however, is required on an on-going basis to maintain a reliable system."

- a. Provide an explanation of "a higher level of pole inspection."
- b. Provide a comparative description of does a higher level of pole inspection differentiate from what has been done for pole inspection in past.
- c. Describe whether the difference is a permanent process change or is utilized as a temporary change to rectify previously uncompleted work.

Attachments Provided Herewith: 0

Response:

- a. A levelized annual program calls for 34,000 distribution poles to be inspected, plus the re-inspection of poles showing early signs of deterioration. Re-inspections are expected to add another 1,700 poles to the annual program, resulting in the need for approximately 35,700 inspections annually. In 2014, inspections fell far short of the 35,700 target. Increased funding in the outer years of this program is required to complete inspections of the full pole plant on the targeted schedule. Because distribution pole inspections were not conducted during the period from 2007 to 2011 and at less than the annual target rate from 2012 to 2014, funding is being requested to expedite the program during the 2016 to 2018 rate years.
- b. In order to complete the distribution pole inspection program on its targeted 10 year cycle, approximately 68,000 inspections per year are to be performed during 2016 through 2018 with approximately 32,000 inspections per year being performed during 2019 through 2022. Poles inspected under the FEMA program will be re-inspected starting in 2019 since the FEMA inspections did include not any preservative treatments.
- c. This is a temporary process change. Ideally, a levelized distribution pole inspection program of 35,700 poles would be performed in each year over the 10 year cycle. This includes re-inspections as discussed in part a. above.

PSEG Long Island
Case Name: PSEG LI - Rate Case 2015
Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-TDP-0190
Date of Response: 03/10/2015
Witness: TD BUDGET AND OPERATIONS

Question:

The T& D panel on page 3 of Exhibit_ (TDP-1) under the column of Justification/OSA Target, states, "Pole inspection program was reinstituted in 2014. Reduction in funding in 2014 results in impact to maintain a 10 year inspection plan. FEMA work will partially offset some of the funding requirements. Moving to a 10 year pole inspection program. Current funding plan moves \$3.6 million into future years. Alternately, pole inspections at .5 M annually, at \$47 per pole 10,638 inspected annually. \$325,000 pole=30.5 year cycle."

Provide the actual amount spent for this program in 2014.

- a. Provide the total number of poles inspected in 2014.
- b. Provide the actual unit cost per pole in 2014.
- c. Provide a detailed breakdown of how the Company established \$47 per pole inspections, and
- d. Provide an explanation of the reasonableness of this figure.
- e. Provide an explanation of "Current funding plan moves \$3.6 million into future years."

Attachments Provided Herewith: 0

Response:

The actual amount spent for this program in 2014. \$98,437.84

Line	Id	Description	Quantity	Unit Price	Net Amount
1	7K-FUM-PMC-003	LINE 320 - SUPERFUME PER POLE	1,661	19.7200	\$32,754.92
2	7S-PIT-000-014	LINE 280 - EXC, SOUND AND BORE	1,076	36.7800	\$39,575.28
3	7K-PIT-000-047	LINE 300 - SOUND ONLY	491	8.5000	\$4,173.50
4	7K-PIT-000-405	LINE 290 - EXTERNAL TREAT	1,046	7.7200	\$8,075.12
5	7K-PIT-000-038	LINE 310 - SOUND AND BORE	763	16.0500	\$12,246.15
6	7S-ADD-000-019	LINE 340 - PRIVATE PROPERTY	1	7.7700	\$7.77
6	7S-VIS-000-007	LINE 330 - VISUAL VERIFICATION	91	3.5500	\$323.05
7	7S-ADD-000-019	LINE 340 - PRIVATE PROPERTY	165	7.7700	\$1,282.05
					\$98,437.84

- a) The total number of poles inspected in 2014 is 2,095 poles.
- b) The actual unit cost per pole in 2014 is \$46.98.
- c) The contract to perform this work has been established as a unit price contract. The cost for pole inspections will vary depending on the scope of work required at each location. The \$47 per pole is an average cost based on the actuals from the 2014 program. The table above provides the unit cost for various activities that may take place at each pole location.
- d) This figure was derived from the 2014 inspections data and is representative of an average cost. Over 50% of the poles were treated as part of the 2014 program, which contributed significantly to the overall program cost.
- e) Explanation of "Current funding plan moves \$3.6 million into future years."
 - In 2014 the budget for pole inspections was \$2.6 million. Due to adjustments to the overall O&M budget plan, this category was reduced to \$0.5 million. Conversely stated, \$ 2.1 million was deferred in this category to future years.
 - In 2015 the initial budget for pole inspections was \$2.6 million. Due to FEMA work offsetting the need for pole inspections, this budget category was modified down to \$2.0 million. Again, due to adjustments to the overall budget plan, this category was ultimately reduced to \$0.5 million. Conversely stated, \$1.5 million was deferred in this category to future years.
 - Collectively, the budget modifications for years 2014 and 2015 resulted in \$3.6 million being moved to future years, keeping in mind that the program commitment is to assure that the total pole plant (340,000 poles) is inspected over the 10 year period (2013-2022).

PSEG Long Island
Case Name: PSEG LI - Rate Case 2015
Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-TDP-0296
Date of Response: 03/23/2015
Witness: TD BUDGET AND OPERATIONS

Question:

Please provide the following including any work papers as needed:

- a. Number of vegetation caused outages, by line and its voltage, for the last 5 years, for voltage classes 69kV and up.
- b. Transmission trimming costs (total and per mile) for the last five years, by line for voltage classes 69kV and above.
- c. Supply, by line for voltage classes 69kV and above, representative ROW cross sections showing the structure centerline and each edge of the ROW indicating the total ROW width and the distance to each side from the centerline or structure location.
- d. Regarding the response(s) to IR DPS-TDP-0119 please provide all work papers, calculations and assumptions supporting the \$3.19M side trim rate request and the approximately \$1.0M T Hazard Tree request.

Attachments Provided Herewith: 3

DPS-TDP_0296_JBHazTreePresentationForTS-rev11(Hazard Tree analysis slides).ppt
DPS-TDP_0296_Vegetation_Related_Trips_69_138kV_2010_2014_1.xls
DPS-TDP_0296_Storm Hardening- Hazardous Tree Removals- DPS March 2015.docx

Response:

- a. PSEG LI became the service provider on January 1, 2014. The attached file "Vegetation_Related_Trips_69_138kV_2010_2014," which is based on historical information in T&D department files, contains the number of vegetation related line trip and outages by circuit and voltage for all transmission lines 69kv and higher for the years 2010-2014. Outages that impacted customers are provided for all weather conditions, except hurricanes or superstorms like Sandy. The column labeled Transmission Line trips is a count of instances when the trip did not result in outages to customers or were only momentary in duration (<5 minutes). The column labeled Transmission outages is a count of instances that did result in outages to customers 5 minutes or longer in duration.
- b. Transmission trimming costs per mile data are not available by voltage class. All Transmission work is bid out on a "Package basis." Packages consist of several transmission circuits sharing a common geography but of various voltage classes. Therefore, a single price (lump sum award) is used for the total miles across all circuits in that package. Favorable pricing (cost savings to the utility) have resulted from the vegetation management contractors when they can reduce travel and crew, vehicle and equipment staging expenses by working in a common geographic area.

- c. Such ROW and easement widths vary from line to line and line segments. As discussed with Staff, sample ROW/easement drawings/photos will be provided on or before March 27, 2015.

d. Side Line Transmission Trim Request

In the aftermath of Hurricane Irene, the State of New York, Department of Public Service conducted a study entitled "In the Matter of the Long Island Power Authority's Preparedness and Response to Hurricane Irene" (Case 12-E-0283) dated June 2012. Excerpts from the DPS analysis, point to the need to expand funding for this program. Page 94 of the report reads:

Finding - The current transmission system vegetation management program budget is below the amounts spent by other utilities and industry guidelines.

About \$1.84 million is currently spent annually to trim transmission facility ROWs; additional funds are spent for annual aerial patrols of the equipment across the entire transmission system. During these patrols, any instances of hard contact are noted and subsequently remedied. Approximately 200 of LIPA's total 986 circuit miles of transmission ROWs receive trimming maintenance annually at an average cost of \$9,200 per mile. In addition, \$763,000 is spent annually on ROW floor maintenance and grass/bare ground maintenance at 140 substation sites.

Recommendation - Increase the transmission system vegetation management program budget.

Historically, LIPA funded typically 200 miles per year of the approximately 1000 overhead transmission circuit miles. PSEG-LI VM strategy was to bring the transmission system onto a four year cycle or trim 250 miles per year. The clearance specification was updated two years ago to 25' sideline clearance for 138 kV conductors and is in line with industry best practices. Pricing for the 2014 program was competitively bid in 2013 resulting in an average price per mile of \$10,280/mile (excluding entire tree removals). Therefore, the 2014 actual cost was projected in the original rate plan filing plus an average cost of 15% for additional tree removals within the clearance zone. Please see workpapers attached to PSEG LI's response to Data Request Nos. DPS-TDP-119 and DPS-TDP-157, as well as the associated confidential documents submitted to the DPS Records Access Officer, which support how the \$3.19 million was derived.

Storm Hardening/ Hazard Trim Request

Please see attached work paper entitled "Storm Hardening- Hazard Tree Removals- DPS March 2015" for further support of PSEG LI's hazard tree request.

Hazardous Tree / Danger Tree Removal

Program Highlights

Preliminary

- LIPA's distribution system has experienced more than 7,500 whole tree related outages over 10 year period from 2003 through 2012. During Sandy 68% of tree caused outages impacting primary distribution were due to whole trees, compared to 25% historical rate.
- 80% of whole tree caused outages have occurred on 5,000 miles of higher risk primary distribution lines (out of 9,000 total miles of lines). These high risk lines are focus of hazard/danger tree mitigation program.
- The two major causes of whole tree outages are hazard (diseased, rotted, badly leaning) or danger (healthy trees which endanger distributions lines) trees falling during storm conditions.
- Hazard and danger trees are situated outside of the normal tree trim line clearance zone and require tree owner approval for removal.
- Analysis assumes 2% current year removed trees, plus half of 1% of cumulative prior years removed trees result in mitigated events.
- Due to municipality and customers objections, not all hazard/danger trees will be able to be removed.
- Hazard/danger tree removals will result in direct prevention of outage events over 13 year analysis period.
- Analysis indicates 40% of whole tree outages will be avoided saving estimated 1.7 Million customer interruptions over 13 years.

Hazardous Tree / Danger Tree Removal

Program Costs & Benefits

Preliminary

- **Repair costs for whole tree outages average approximately \$31,000 for both catastrophic and non-catastrophic storms.**
- **While difficult to quantify strictly for hazard/danger trees, historically branch/limb caused outages have occurred at 4:1 ratio to whole trees. Avoided branch/limb outages from removed trees provide additional program benefit.**
- **Average cost per tree/branch removal across all categories is approximately \$1,500**
- **LIPA 2012 Hazard/Danger funding level \$1M. LIPA Energy Plan called for \$5M.**
- **A \$9.5M program over 10 years would allow 5,000 miles of highest risk lines to be mitigated.**
- **Expected reduction in storm costs over 13 years would not only offset the cost of program, but provide positive ROI.**

Hazardous Tree / Danger Tree Removal

Hazardous/Danger Tree Removal ROI Analysis: Projection Including Catastrophic Events Preliminary

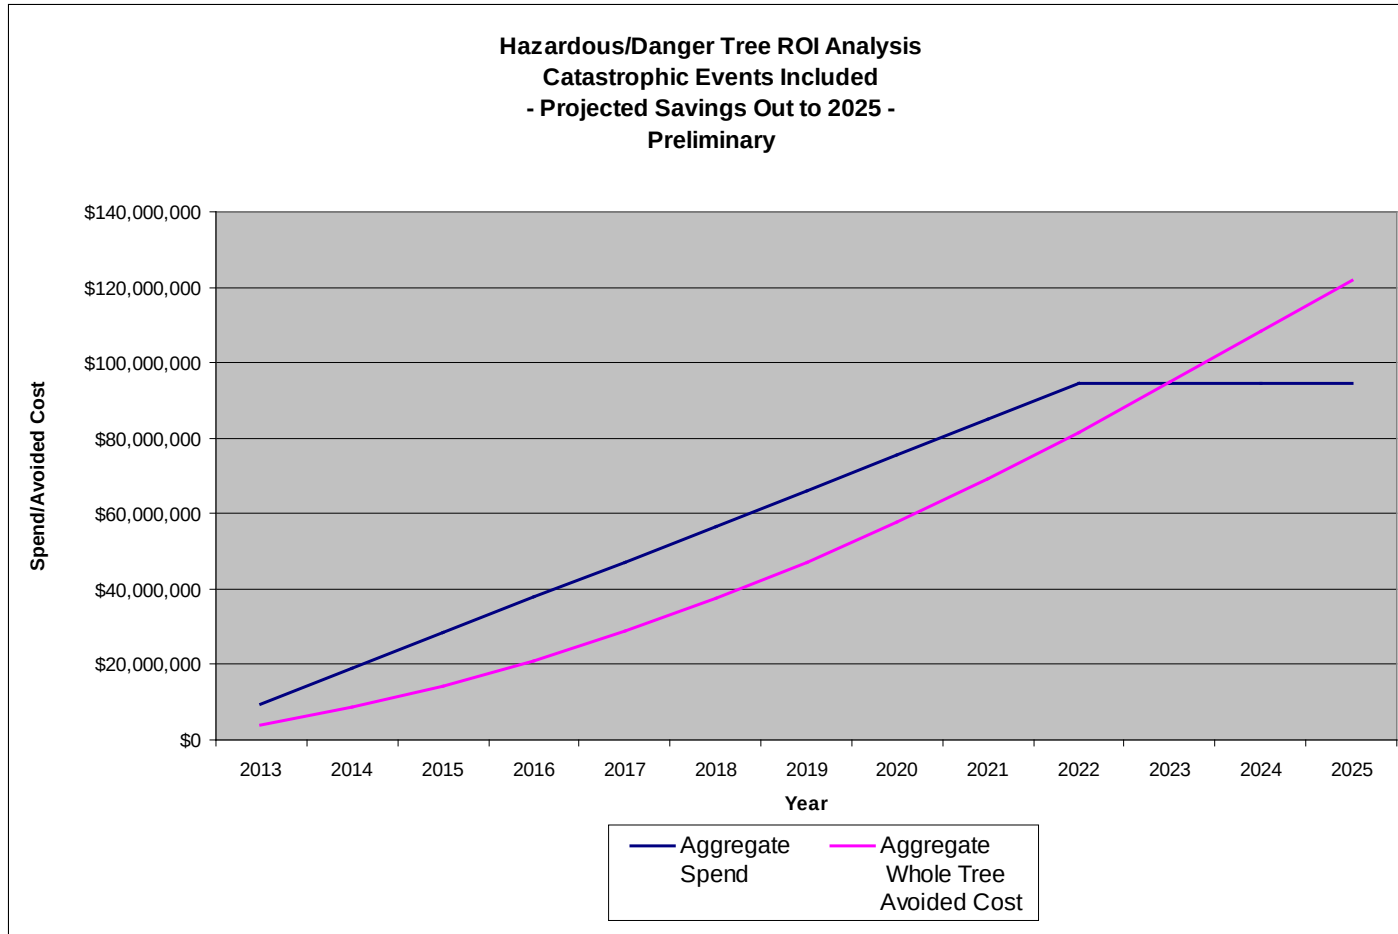

Whole Tree Event Mitigation Analysis Catastrophic Events Included

Program Year	Hazard And Danger Tree Events	Yearly Spend	Aggregate Spend	Yearly Trees Removed	Cumulative Trees Removed	Mitigated Damage Locations	Cumulative Mitigated Damage Locations	Whole Tree Yearly Avoided Cost	Aggregate Whole Tree Avoided Cost

	9,802					3,998		\$121,866,658	

Overview and Model Statistics

- 1 10 year average actual event counts (2003 through 2012) used for "Hazard and Danger Tree Events"
- 2 Funding level based on Journal of Arboriculture July 23, 2003 study and 10 year review of LIPA whole tree outage profile:
Aggressive hazardous tree removal defined as 10-15 trees per mile. 30 trees per mile viewed as very aggressive.
80% of all whole tree (4,787) outages occurring on 57% of LIPA OH primary circuits (5,037 miles)
Funding level would permit blended high aggressive levels of tree removal (12.5 trees/mile primary)
Average cost of tree removal \$1,500
- 3 6% of removed trees credited towards mitigation over 13 analysis
- 4 40% percent of whole tree events avoided due to removals over 13 year analysis
- 5 Expected benefit of mitigated branch/limb events sourced from hazard/danger trees removed not factored into avoided cost.
- 6 Number of customer outages avoided over 13 years 1.7 million
- 7 Repair cost weighted average of repairs during catastrophic and non-catastrophic storms

* Excludes transmission outages during hurricane event

Storm Hardening/Hazard Tree Removals- DPS March 2015

In the mid-2000's, LIPA recognized the need to develop a program to address hazard trees located outside the T&D line clearance zone. On blue sky and minor storm conditions, the majority of these trees pose minimal risk to the electric system. In 2006, LIPA proposed in its Energy Plan to spend up to \$5 million annually for storm hardening/hazard tree mitigation. However, the actual spending, as outlined in DPS-TDP-111, averaged only \$2.4 million (from 2011-2014).

Over the past 10 years, best utility vegetation management (VM) practice includes a programmatic hazard tree mitigation program realizing that the vast majority of storm damage in severe weather events result from falling trees/large portions of trees originating outside the specified clearance zone.

In the aftermath of Hurricane Irene, the State of New York, Department of Public Service conducted a study entitled "In the Matter of the Long Island Power Authority's Preparedness and Response to Hurricane Irene" Case 12-E-0283 dated June 2012. Excerpts from the DPS analysis, points to the need to expand funding for this program. Page 98 of the report reads:

Storm Hardening/Hazard Tree Identification & Removal

About \$2 million annually is budgeted for storm hardening tree work. This work mostly involves the three-phase portion of selected distribution circuits where potentially hazardous trees are identified for removal. Customers are typically contacted to obtain their agreement for the tree removals; contractors perform this work on a "unit cost" basis determined by the tree diameter. This work is performed in addition to the tree trimming work on entire circuits. Given the extent of damage caused during Irene, additional funding from the storm hardening program, that has been under-expended in recent years since 2006, should be considered for use in this program.

Excerpts from the DPS analysis, further go onto expound the importance of the Transmission component of the hazard tree program. Page 93 of the report reads:

B. TRANSMISSION RIGHT OF WAY MANAGEMENT

Finding - The current transmission system vegetation management program is inadequate.

During Irene, out-of-service transmission lines accounted for about 180,000, or about one-third, of the customers who lost electric service. Most of the outages were due to hazard trees, especially those on the sub-transmission lines where there are narrow easements. Transmission lines are constructed to withstand storm impacts because of their importance as the backbone of the electric system. However, higher transmission system reliability cannot be achieved without a supporting vegetation management program. The tree population and density on Long Island inhibits right-of-way widths. Also, many sub-transmission lines are located near highways and they have distribution lines under built on them. This leaves very narrow clearance corridors.

In the aftermath of Hurricane Irene (and then Superstorm Sandy), Utility Vegetation Management expert, Environmental Consultants Incorporated (ECI) was solicited by National Grid/LIPA to evaluate the VM program and developed a report "Comparative Assessment of LIPA's Vegetation Management Program" (already provided in response to DPS-TDP-171). In section 3.5, the ECI report cites the 2006 LIPA storm hardening as "proactive" and follows a similar strategy with many utilities. ECI noted that a Geographic Information System based handheld hazard tree identification program is under development to further optimize the identification and tracking of hazard trees. Throughout the report, ECI points out the additional challenges for LIPA Vegetation Management program in preventing storm damage given the lack of or narrow width of LIPA owned ROW's which also compounds the problem of hazard trees falling from outside the ROW/transmission clearance zone. In addition, based on follow-up discussions with ECI, it indicated that Central Hudson in New York State funded \$9.6 million over two years (2012-13) for hazardous tree removal.

In 2013, National Grid conducted a preliminary analysis entitled "JBHazTreePresentationForTS-rev-11" (Hazard Tree slides) which is attached for reference. This study used Superstorm Sandy outage data to indicate that 68% of primary distribution outages were due to whole trees coming down. From an economic standpoint a ROI case was presented for funding \$9.5M annually for hazardous tree removal. Although transmission was not part of this study, much of LIPA's transmission system is co-located with distribution and shares similar risks and costs.

Based upon all of the above data points, Reliability Management and Vegetation Management proposed (in mid- 2013) an initial annual budget for T&D hazardous tree removal to the PSEG-LI Transition team of approximately \$5M/ year. In late 2013, as the Enhanced PSEG-LI Vegetation Management strategy was developed and a higher priority was placed on 1) Moving the Distribution system circuit trim toward a 4 year cycle 2) Enlarging the Distribution Clearance Specification 3) Establishing the Transmission system onto a four year cycle. Note that item #1 is in progress (2014-2017) and items 2 and 3 have been implemented. Given the budgetary constraints of the 2014-2015 rate freeze as well as the large amount of financial resources to bring the T&D system onto 4 year cycle, the 2015 request was established at \$2.2 million with the plan to increase the annual funding in 2016. The estimated division of 20% to 40% of this budget to transmission is commiserate with the allocation of base circuit clearing funding for T/D (\$3 million/\$15.7 million) or a minimum of 19%. Recognizing the importance of the Transmission system, as well as that about one-third of customers effected during Irene (mostly by hazard trees) were impacted thereby, a good target is 33% of the total hazard tree removal dollars would be used for Transmission hazard trees. Using this figure as a guide, transmission hazard tree removals would be expected to be approximately \$733,000 in 2015. As stated, in the initial response to DPS-TDP-119, the actual allocation will be determined by field risk assessment of the trees adjacent to the T&D circuits trimmed as well as those on historically high risk of entire trees falling on conductors as the year progresses.

PSEG Long Island
Case Name: PSEG LI - Rate Case 2015
Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-TDP-0296 SUPPLEMENTAL
Date of Response: 03/27/2015
Witness: TD BUDGET AND OPERATIONS

Question:

Please provide the following including any work papers as needed:

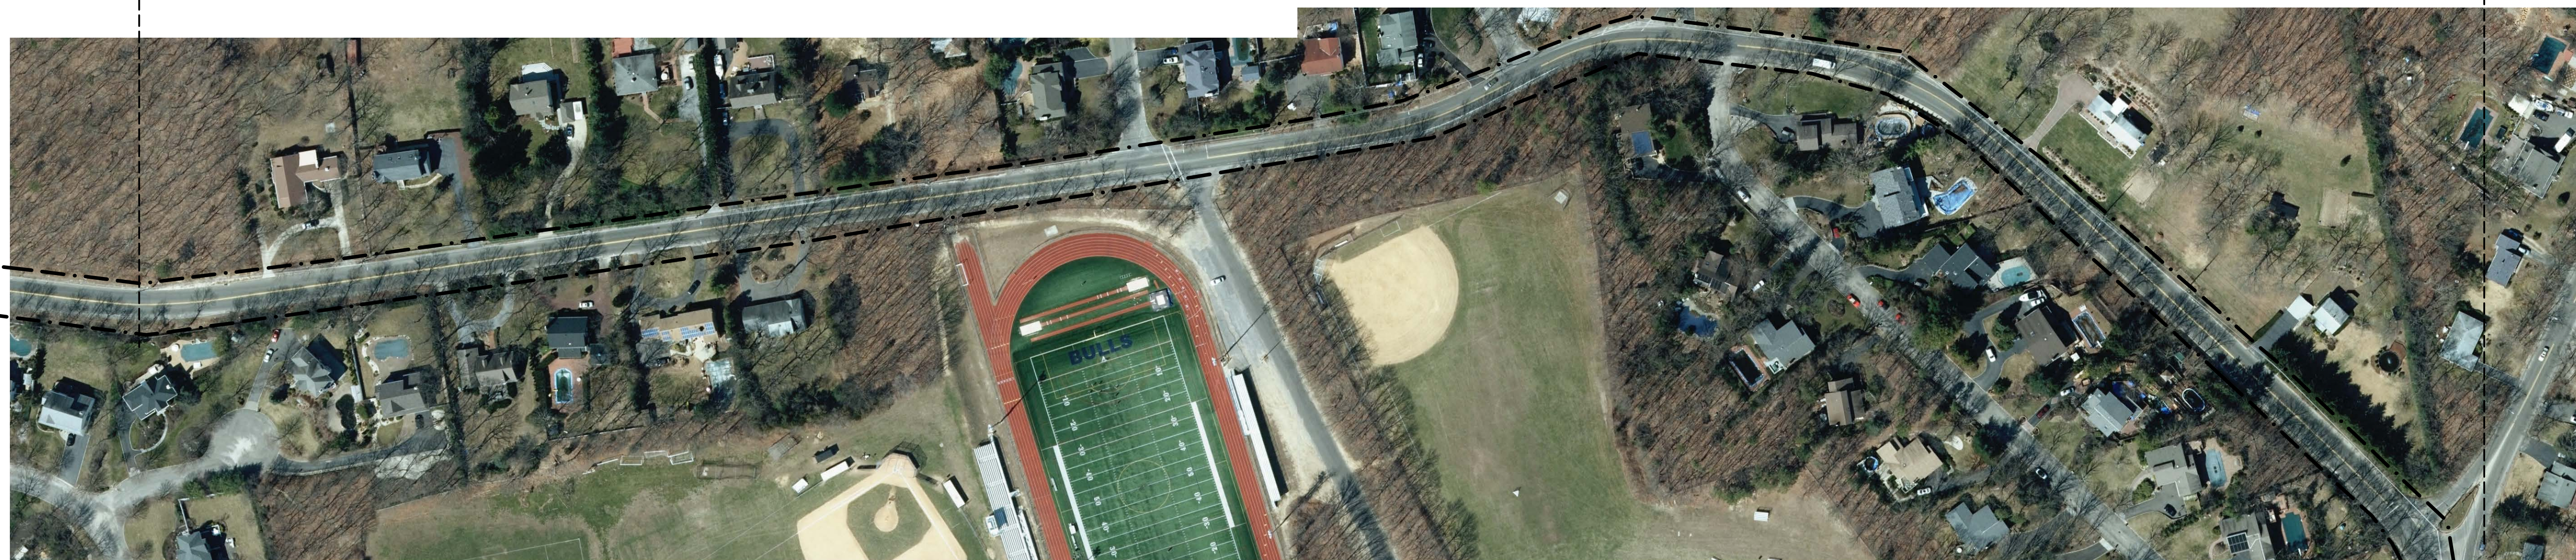

c. Supply, by line for voltage classes 69kV and above, representative ROW cross sections showing the structure centerline and each edge of the ROW indicating the total ROW width and the distance to each side from the centerline or structure location.

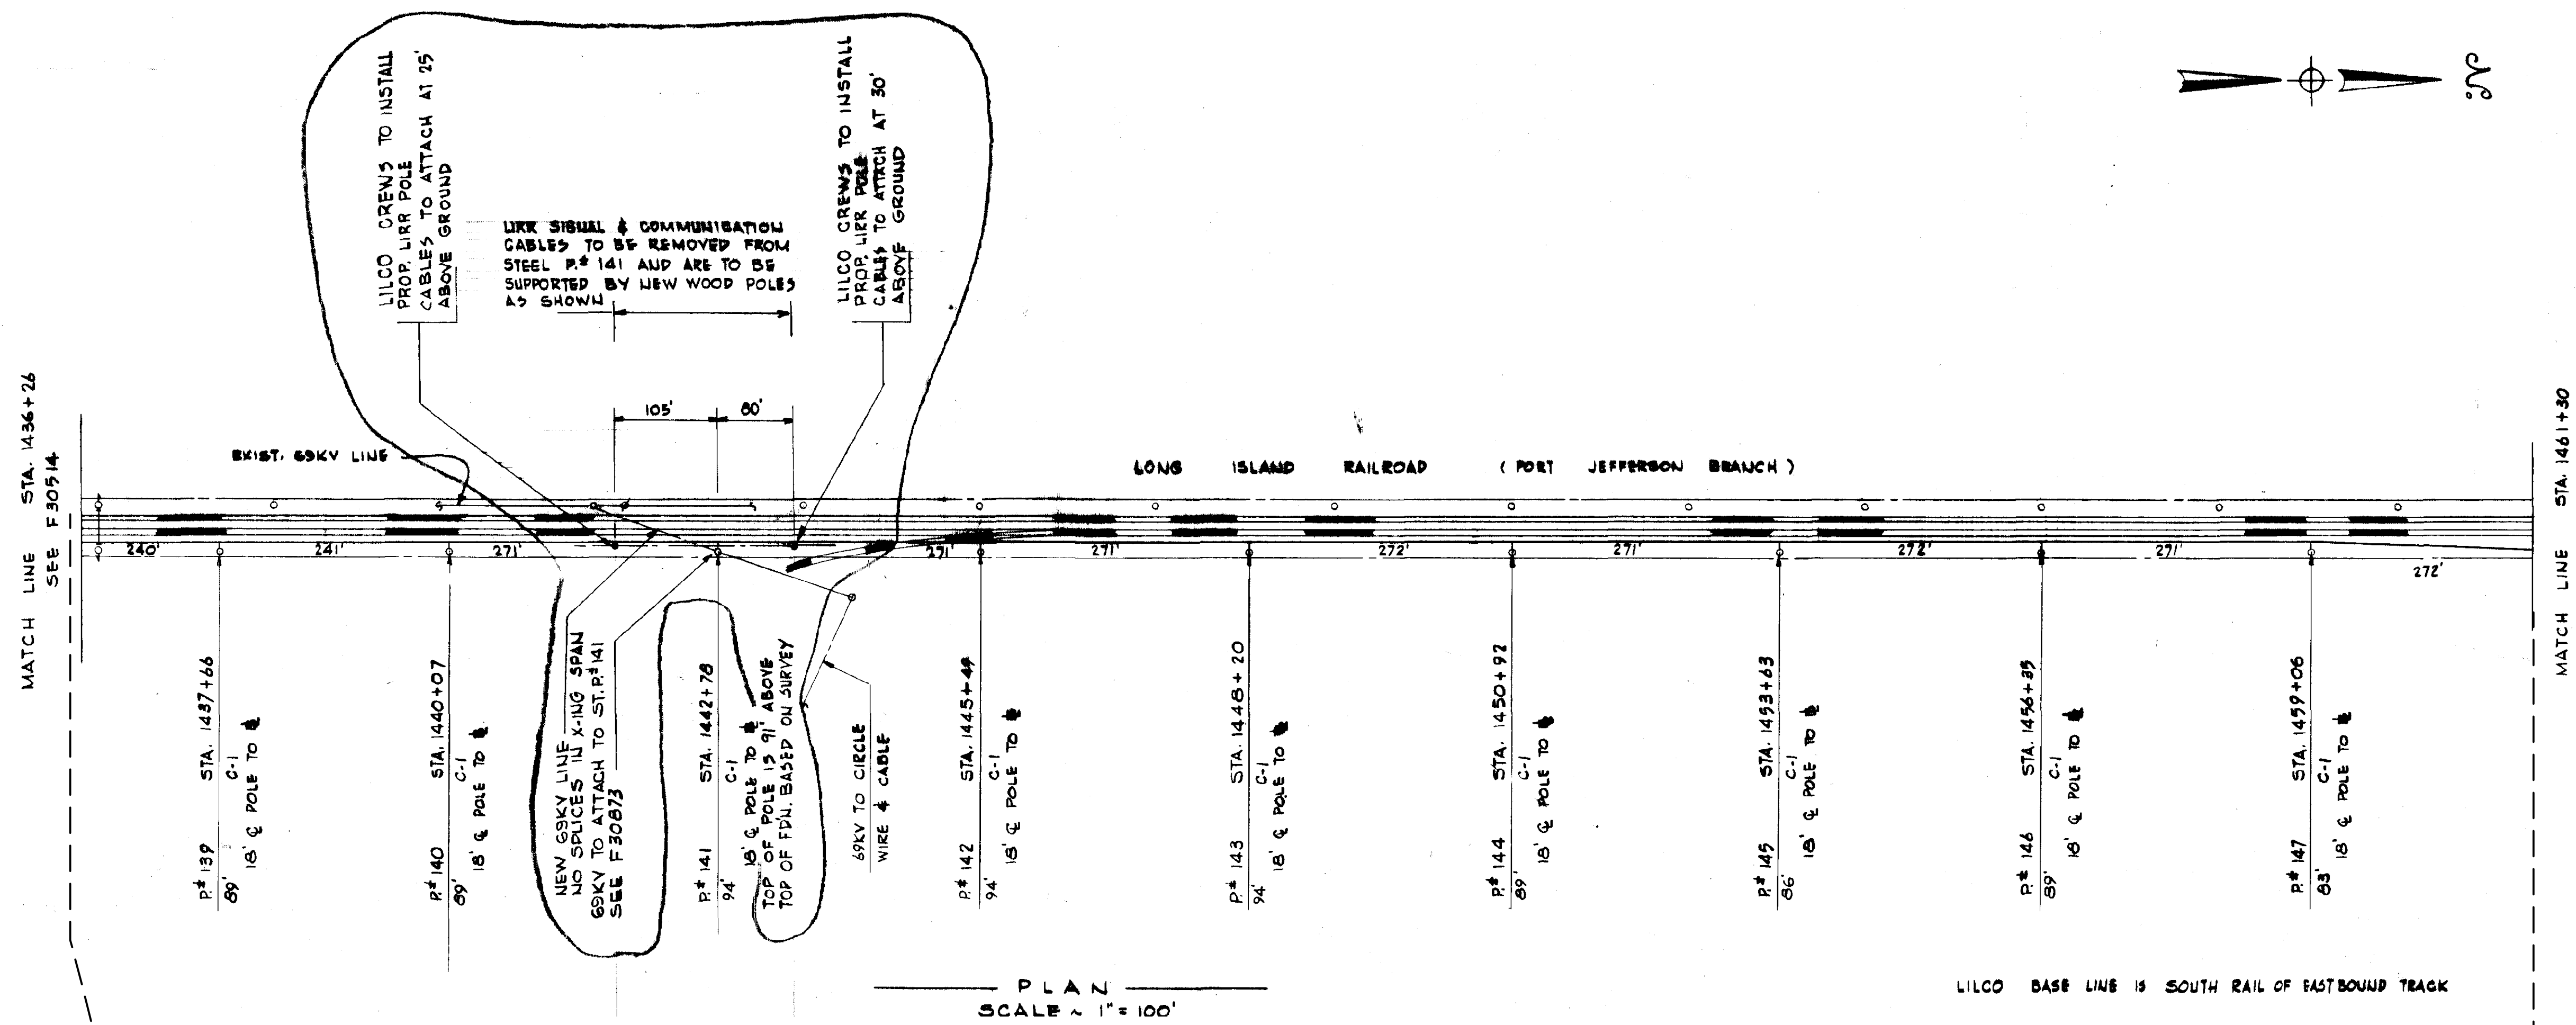

Attachments Provided Herewith: 4

DPS-TDP_0296 SUPPLEMENTAL_LOC_NEW.pdf
DPS-TDP_0296 SUPPLEMENTAL_NEW_RUL.pdf
DPS-TDP_0296 SUPPLEMENTAL_IND_SMITH.pdf

Response:

Attached are four sample design drawings and corresponding images of LIPA's above ground transmission ROWs/easements. The design drawings are from PSEG LI's files, and the corresponding photographs are from the State of New York. We drew dotted lines on the photographs to help show the approximate location of the transmission corridors. The drawings and photographs are not necessarily reflective of current conditions, as the facilities may not have been built exactly as shown on the drawings and the photographs were taken approximately two years ago.

PSEG Long Island
Case Name: PSEG LI - Rate Case 2015
Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-CBP-0318
Date of Response: 03/27/2015
Witness: CAPITAL BUDGETS

Question:

- a. Provide a breakdown of the spending allocation for the “New Business” line item shown on Exhibit CBP-2 page 1 of 4 for calendar years 2016, 2017 and 2018 in terms of PJD references B3.1 (New Business Expenditures), B3.2 (CIPUD), B3.3 (Underground Residential Development) and B3.4 (Underground Residential Development Services).
- b. Provide 2014 actual expenditures for PJD reference B3.1, B3.3 and B3.4 as well as historical expenditures for PJD reference B3.2 for each calendar year 2010 through 2014.
- c. Explain how 2015 budgets were calculated from historic data and how 2016, 2017 and 2018 budgets were projected from the 2015 budget.
- d. Provide the historic and projected mix of work performed using in house and contractor resources as well as justification.

Attachments Provided Herewith: 2

DPS-CBP_0318_NewBusiness 2016 - 2018.xlsx
DPS-CBP_0318_NewBusiness Hist Spend 2010 - 2014.xlsx

Response:

- a. Please see attached document “New Business 2016 – 2018.”
- b. Please see attached document “New Business Hist Spend 2010 – 2014.”
- c. The 2015 budget was prepared by considering historical spending from 2011 through 2013 and the 2014 spending forecast as of September 2014. The spike in spending from 2012 to 2013 was attributed to post Hurricane Sandy customer rebuilding activities. The budget for years 2016 through 2018 represents a year over year escalation of 3% from the 2015 budget.
- d. For 2010 through 2012, the mix of in in-house versus contractor labor (by dollars) was approximately 25 % in-house. In 2013, the mix (by dollars) was approximately 40% in-house.

New Business	PJD Reference		2016	2017	2018
	B3.2	CIPUD	\$309,000	\$318,270	\$327,818
	B3.1	New Business	\$18,334,000	\$18,884,020	\$19,450,541
	B3.1	New Business (Credit reimbursement from customers made directly to LIPA)	-\$5,459,000	-\$5,622,770	-\$5,791,453
	B3.3	URD	\$1,895,200	\$1,952,056	\$2,010,618
	B3.4	URD Services	\$412,000	\$424,360	\$437,091
		TOTAL	\$15,491,200	\$15,955,936	\$16,434,615

PJD Reference		2010	2011	2012	2013	2014
B3.1	New Business					\$28,183,639
B3.1	New Business Reimbursements					-\$4,426,470
B3.2	CIPUD	\$955,812	\$641,253	\$424,681	\$38,660	\$41,451
B3.3	URD					\$3,521,735
B3.4	URD Services					\$497,934

PSEG Long Island
Case Name: PSEG LI - Rate Case 2015
Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-TDP-0365
Date of Response: 04/02/2015
Witness: TD BUDGET AND OPERATIONS

Question:

Follow up questions to the Company's response to DPS-187:

- a. Is the \$3.2 million budget requested in each rate year from 2016 to 2018 only for Distribution Pole Inspections. If not, provide a cost breakdown of the \$3.2 million into Distribution and Transmission Pole inspections in each rate year.
- b. Are all of the 68,000 poles expected to be inspected annually limited to distribution poles? If not, provide a breakdown on how many inspections are expected to be performed for distribution and transmission poles respectively in each rate year.
- c. Clarify which three calendar years are the first three years of the current 10 years cycle?
- d. Of the approximately 25,000 distribution poles that were inspected during the first three years, how many distribution poles were inspected respectively in each of those three years?
- e. Provide the total costs incurred for the distribution pole inspections in each of first three years

Attachments Provided Herewith: 0

Response:

- a. The \$3.2 million budget requested in rate year from 2016 to 2018 is only for Distribution Pole Inspections.
- b. All 68,000 poles to be inspected annually from 2016 to 2018 will be distribution poles.
- c. All transmission poles were inspected in 2011 and 2012. A limited number of distribution poles were also inspected in 2012 prior to the start of distribution pole inspection cycle which runs from 2013 to 2022. The first 3 years of the distribution pole inspection cycle are 2013, 2014 & 2015.
- d. Please see chart below. Based on the information in the chart, a better approximation for the number of distribution poles that were inspected during the first three years is 32,000 instead of 25,000. No poles have been inspected yet in 2015. Pole inspections can only be done when the ground isn't frozen or covered with snow.
- e. Please see chart below.

	Pole Inspection Years							
	2012		2013		2014		2015	
	\$ spent	# of Poles inspected	\$ spent	# of Poles inspected	\$ spent	# of Poles inspected	\$ spent	# of Poles inspected
Distribution Pole Inspections with Preservative Application	\$238,193	5,648	\$127,867	2,716	\$98,437	2,095	\$500,000 Budget	10,700 Expected
Distribution Pole Inspections on FEMA Circuits with No Preservative Application					\$500,000	27,004		

The pole inspections done on the FEMA circuits did not include the application of preservatives to extend the life of these poles. FEMA has declined to accept the costs to inspect these poles as part of their storm hardening program. These poles will be re-inspected during later years of the current 10 year cycle and will be treated with preservatives to extend their useful life. These poles are not considered as part of the normal inspection program (see DPS-TDP-0194).

PSEG Long Island
Case Name: PSEG LI - Rate Case 2015
Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-TDP-0378
Date of Response: 04/14/2015
Witness: TD BUDGET AND OPERATIONS

Question:

The following questions are related to DPS-TD-169 as pertaining to distribution cycle trimming.

- a. Provide the actual number of Distribution Circuit Miles trimmed in 2014 that is representative of the cost provided in the response to DPS-TD-169.
- b. Provide the expected number of Distribution Circuit Miles to be trimmed in 2015 that is representative of the cost provided in the response to DPS-TD-169.

Attachments Provided Herewith: 0

Response:

The following questions are related to DPS-TD-169 as pertaining to distribution cycle trimming.

- a. 1,841 miles.
- b. 1,650 miles are expected to be trimmed based on the cost provided in response to DPS-TD-169. Note that the original projection, prior to the 2015 RFP award results, was that 1,560 miles were expected to be trimmed based on the cost provided in response to DPS-TD-169.

PSEG Long Island
Case Name: PSEG LI - Rate Case 2015
Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-TDP-0382
Date of Response: 04/14/2015
Witness: TD BUDGET AND OPERATIONS

Question:

Relative to the Company's response to DPS-TDP-0111 specifically the attachment - PSEG LI Tree Trim Acts Bud 2011-2014, provide the following including any work papers as needed:

- a. Provide a complete breakdown of each component and its cost that make up the total Customer Support costs for the years 2013 and 2014.
- b. Describe what the customer support program does or is designed to do. Provide any benchmark data supporting the program description and or accomplishments.

Attachments Provided Herewith: 1

Spec-PSEGLI_CustomerServiceWork2015.docx

Response:

- a. Cost breakdowns are not available for the component portions of the program for that time period. A summary of the type of jobs comprising the Customer Support portion of this program is as follows:

JOB TYPE	2013- FREQUENCY	2014- Jan. July* FREQUENCY
Pre-check Tree on Line	13,861	7,602
Trim Tree on Line	5,325	2,682
Pre-check Top (Make Safe for Customer Removal)	2,297	1,182
Top Tree/ Make Safe	1,234	565
Pre-check Tree Misc	1,140	N/A
Tree Work Misc	192	161

*Due to PSEG LI change in Outage Management Systems (OMS) this data breakdown is no longer available. Note: a total of 5,423 tree jobs were recorded (Aug- Dec. 2014)

The Customer Support program consists of three sub-Programs. A sample of costs incurred for this program by sub-program from 2014 found the estimated breakdown of total program costs {Shown as % below}:

- o Customer- External {71%}
- o Customer- Municipal {9%}

- o Customer- Internal Operations Support (hot spot trimming between cycles) {20%}
- b. The Customer Service/ Support Vegetation Management Program is composed of three major sub-programs (outlined in the response above). A further description of these sub-Programs is as follows:

Customer (External) Requests- PSEG LI customers call the Call Center for a variety of tree related concerns. Two major categorizations of the type of calls received are:

- 1) Reliability/ Safety concerns. Customers are concerned that a tree or limbs are on or near PSEG LI conductors and pose a risk of causing an electric outage or a threat to public safety. PSEG LI utilizes a single person (Pre-Checker) to assess the validity of outage or public safety risk as a cost effective strategy to respond to these calls. Approximately 60 to 70 percent of customer inquiries are resolved by the Pre-Checker determining that there is not a tree hazard present, and this is explained to the customer (no physical work required). If there are limbs in contact with the conductors, and it's considered a non-imminent hazard of causing an outage (routine trim), the Pre-checker will coordinate with the Line Clearance Supervisor (LCS) to see if the circuit is scheduled for trim. If the circuit is scheduled for trim, the customer will be told that a tree crew is scheduled to come later in the year to trim the entire circuit including this location.
- 2) Make Safe for Customer Removal- Customers want to remove a tree on their property which is in close proximity to PSEG LI primary voltage conductors. Under the New York State High Voltage Proximity Act the utility has an obligation to "make safe" by clearing trees within 10' of energized conductors >600 volts. Typically on Long Island the tree trunk or main leaders lie within 10' of the primary thereby requiring us to "top" the tree. The customers' contractor will then clean up the debris and remove the balance of the tree.

Municipal Customer Requests- Municipalities own most of the street trees that are under or adjacent to PSEG LI's distribution lines. Municipalities look to remove these trees for a variety of reasons (i.e., unsafe condition, sidewalk or road work, etc). For large public works projects involving the municipalities and PSEG LI, a Capital work order is generated for all utility construction and associated tree work (charged back to the municipality / no cost to the Vegetation Mgt. program). However, for smaller requests from municipalities those locations are checked by the LCS to ensure the trees either pose a risk to the electric system or, if the municipality wants to remove their tree, that it is within 10' of the primary (NYS HVPA Act) before authorizing work. Often, there are synergies and benefits to working collaboratively with the municipal crews to remove large street trees (versus the Company constantly cycle trimming). PSEGLI also has a wire friendly tree rebate for municipalities so that if they replace the tree it will be a lower height/ slow growing species which poses reduced future risk of causing outages and lower trimming costs to the utility.

Internal Customer Operations Support- National Grid previously operated the distribution primary on a reliability based prioritization system for trimming distribution circuits (3, 5, 7 year trim "guideline" for circuits, no firm cycle). Under this system, local tree-caused reliability problems that may not cause major impact on overall circuit

reliability were not circuit trimmed entirely and therefore needed more frequent local “hot spot” trimming. PSEG LI’s long term distribution line clearance strategy is to increase the clearance zone and bring the system onto a 4 year cycle. One of the benefits of this strategy is to reduce more costly hot spotting. However, there is still a need to respond based on Operations or Customer Relations raised issues to poor reliability areas where tree contacts are the cause of outages (Multiple Customer Outage criteria of 4 sustained interruptions in 12 months).

To assist with your review, attached is PSEG LI’s Specification for Line Clearance - Customer Service Work which discusses the cutting, clearing, pruning and tree removal of vegetation along the Company’s overhead electric lines and corresponding substations in connection with Customer services requests.

Specification for Line Clearance – Customer Service Work

Vegetation Management Section
Projects & Construction Department
PSEG Long Island, LLC
Revised: 10-28-2014

1.0 Scope / Intent

This specification covers the cutting, clearing, pruning and tree removal of vegetation along the Company's overhead electric lines and corresponding substations. The intent is to define the minimum clearances to be obtained between the overhead conductors and vegetation along with acceptable pruning methods. This specification is strictly for Customer service requests.

2.0 Program Objectives

- 2.1 Under the direction of the Agent's Line Clearance Supervisor, a Pre-checker shall be responsible to investigate, respond, report and satisfy Customer Service Calls to Company related to tree trim requests. The Pre-checker shall be considered a one-person crew with pick-up truck, equipped as outlined in Attachment "A".
 - 2.1.1 Definitions of Customer Service Calls are as follows:
 - 950 – Tree Trim Request
 - 953 – Tree Trim Removal – classified as "clear tree for safe removal" – Customer responsible for debris removal.
 - 954 – Tree Trim Miscellaneous – not classified as a 950 or 953. Typically a Customer inquiry that requires a visit and/or a call back. Details are entered in Remarks section.
- 2.2 The Pre-checker shall be required to report updates on the status of Customer service calls inclusive of data input into a computer supplied by the Company / Agent. Customer service calls reporting shall be updated the same day the work is completed and/or status changed (i.e. Customer appointment changed, work in progress, follow up work required, etc.)
- 2.3 The Agent's Line Clearance Supervisor shall be responsible for supervising the Prechecker, providing authorization for work to proceed, and determining if work can be deferred until the next circuit trim. Agent's Line Clearance Supervisor is also responsible for reviewing the quality of work.
- 2.4 For tree toppings / pruning for clearance (953's), the Pre-checker will check and secure written permission for the work from the Customer and obtain authorization from the Agent's Line Clearance Supervisor.
- 2.5 If outage is required, Agent's Line Clearance Supervisor shall be responsible to schedule outage, notify the Customer and others to be affected and enter the outage appointment in the OMS Outage system.
- 2.6 For jobs requiring outages, the Tree Trim crew, under the direction of the Tree Crew Foreman, will coordinate with Electric Service (who carries out the steps to deenergize the planned area) in performing the tree trim work safely.
- 2.7 These specifications are designed to address:
 - 2.7.1 The optimum clearance requirements necessary to sustain an appropriate level of safety and reliability
 - 2.7.2 The arboricultural methods that are acceptable to the Agent.

3.0 Tree Removal (Prune for Clearance) Scope of Work

- 3.1 This service is limited to pruning trees in close proximity to Company wires in order to provide a safe working distance for others to remove tree. Prune for clearance is defined as a minimum of ten foot clearance from the primary conductors. Additional clearance may be required to ensure the safe removal of the tree. In some cases, at the direction of the Agent's Line Clearance Supervisor, the entire tree may be removed.
- 3.2 This service will mainly involve trees located on private or municipal (Non-Company) property, both rear and side yard, as well as on the highway.
- 3.3 It is anticipated that many of the tree removals will be privately owned trees, located on private property away from the highway. It is also expected that the work may be in close proximity to various structures (garages, sheds, pools, etc.). It is understood that fences are not considered a structure.
- 3.4 The tree owner shall be responsible for securing all permitting required by municipalities and providing proof to the Agent's representatives.
- 3.5 Tree removal and prune for clearance jobs will be issued to the Contractor using a Tree Clearance/Removal Request Form.
- 3.6 It is the policy of the Agent that the tree owner shall be responsible for removing and properly disposing of all debris resulting from the work. In some cases the Agent's Line Clearance Supervisor may elect to remove some or all of the debris.
- 3.7 This work will be issued under one of the following options as determined by the Agent's Line Clearance Supervisor:
 - 3.7.1 Pruning of limbs away from Company electric lines with brush and wood removal the responsibility of others.
 - 3.7.2 Pruning of limbs away from Company electric lines, removal of all brush, and the wood either left stacked on site or removed.
 - 3.7.3 Removal of the entire tree with the stump cut close to the ground, removal of all brush, and the wood either left stacked on site or removed.
 - 3.7.4 Removal (grinding) of the stump to the depth of 4" (minimum) below grade. The Contractor shall be responsible for clean up of debris. The area shall be free of debris at ground level. A stump removal may be issued as a separate job with the tree having been removed by others.

4.0 Definitions

Terms not otherwise defined elsewhere in this Specification or the Agreement are defined as follows:

"ANSI A-300" shall mean American National Standard for Tree Care Operations (Part 1) Tree, shrub, and other woody plant maintenance (pruning), ANSI 2001.

“Best Management Practices” shall mean and reference to “Best Management Practices – Utility Pruning of Trees” – International Society of Arboriculture 2004.

“Brush” shall mean all pruning debris equal or less than 6” in diameter.

“Customer” shall mean a customer of LIPA or resident located in the LIPA Service Territory.

“Debris” shall mean vegetative debris consists of whole trees, tree stumps, tree branches, tree trunks, and other leafy material.

“Directional Pruning” shall mean pruning a leader back to a lateral that will direct future growth away from the conductors (formerly drop crotch pruning).

“Field Representative” shall mean the Manager of the Vegetation Management or the duly authorized representative appointed by the aforementioned to direct, inspect and coordinate the field effort to assure Contractor compliance with all technical aspects of the contract.

“Job site” shall mean the locations of the construction services, labor, materials, equipment, and construction systems contained in the contract documents.

“Secondary” shall mean the conductor, either triplex or open wire, that extends from the transformer to the Service Drop. Secondary spans may run along under primary spans or separately.

“Service Drop” or “Service Line” shall mean the last span of triplex or open three wires extending to the building or meter pole.

“Specified Clearance Zones” shall mean the specific distances above, below, and to the sides within which pruning shall be performed.

“Under Wire Trees” shall mean trees and saplings that have naturally seeded or sprouted beneath the electric lines, and that should be removed in order to reduce future tree line conflicts.

“Volunteer Trees” shall mean naturally seeded trees.

“Wire Friendly Tree” shall mean smaller, slower growing tree that greatly reduces the probability of developing hazardous conditions.

“Wood” shall mean any limb greater than 6” in diameter. Wood left on site will be cut into manageable lengths.

5.0 Time and Material and Storm Response

Customer Service crews may be assigned to various locations to respond to storm restoration events. Equipment will be staged both on Company property or other job site locations. Company and/or the Agent are not responsible for storage or protection of Contractor's equipment.

6.0 Standard Clearance

All pruning shall comply with the PSEG Long Island "Specification for Line Clearance – Distribution Circuit Trim", revised 10-27-2014, as outlined in Section 4, "Scope of Work".

7.0 Removal of Debris

While it is the responsibility of the tree owner to remove and properly dispose of all debris, in any circumstances in which, at the discretion of the Agent's Line Clearance Supervisor, the Contractor participates or aids in debris removal, the following shall apply:

- 7.1 Contractor shall have attended NYS Dept of Agriculture and Markets Asian Long Horned Beetle training and have signed Compliance Agreement. The Compliance agreements must be updated every two years.
- 7.2 The Contractor techniques for handling and transporting the tree trim debris shall be in conformance with Title 6 of the New York State Codes, Rules and Regulations ("NYCRR"), Part 360 etc.Seg. and Part 370 etc. Seg: Article 11 of the Nassau County Health Code: and Article 12 of the Suffolk County Health Code and any other applicable state code, rule, or regulation applicable to the disposal of the tree pruning debris.
- 7.3 The Contractor is responsible to secure all dumpsites mutually agreed to by the Agent's Line Clearance Supervisor. It is understood that the Contractor is required to supply the Agent, prior to performing the work, with the disposal and / or beneficial use sites proposed to be utilized. The Agent must approve such sites prior to performance of the work.

8.0 Wetlands

Tree trimming in NYSDEC designated wetlands and adjacent areas shall be subject to the following additional restrictions. Any exceptions shall require a specific permit to be obtained.

- 8.1 The Contractor shall notify the Agent at least thirty days in advance that trimming within a wetland area is to be performed, so that necessary notification to NYSDEC can be made.
- 8.2 Tree shall not be removed, nor excessively cut back – trimmed only.
- 8.3 Tree debris and / or wood chips shall not be left within designated wetland boundaries.
- 8.4 Vehicles shall not enter within designated wetland boundaries.

9.0 Work Performed Along LIRR ROWs

- 9.1 Flag Protection: The Agent will provide flag protection for all LIRR ROW work at the discretion of the Agent's Line Clearance Supervisor. A minimum of eight climbers will be required at all times for any RR ROW work. Every attempt will be made to keep flag protection down. If the Contractor determines that LIRR flag protection is necessary, the Agent's Line Clearance Supervisor shall be notified by 11:00 am the day before the flagging required.
- 9.2 Joint Trim Projects (Where Applicable): The standard clearance zone may be extended to include LIRR speed, signal, and LIRR power conductors; and / or additional LIRR requested vegetation removal. In such cases, the scope of such work is identified in the bid documents.

10.0 Pricing

- 10.1 The Contractor shall provide a unit price for the tree removal or pruning based on the size of tree. Sizing will occur in ranges of 6", starting with 6 – 9 inches (up to but not including 9") in diameter. The measurement will be taken by using a Loggers tape, placed around the trunk at a height 54" above the ground.
- 10.2 Sizing for trees with multiple leads beginning below 54", each lead will be measured and the diameters added together. The total then shall be converted to single diameter to determine the unit price category.
- 10.3 The Contractor shall provide unit prices for the removal (grinding) of tree stumps for both highway and rear property locations. The measurement shall be taken around the stump and converted to diameter.
- 10.4 Units for pruning and removals are to be provided for each Division as described in the Request For Proposals.

11.0 Completion and Inspection of Work

- 11.1 Crews will normally work a 40 hour week, 8 hours a day, Monday through Friday, 0700 to 1530 hours (or any 8 hours between 0600 and 1700 hours when mutually agreed upon). Additionally, the Contractor will be expected to work extended hours as required by the Agent's Supervisor.
- 11.2 All work shall be performed in compliance with municipal work hour restrictions.
- 11.3 The Agent reserves the right to inspect and approve the methods used to achieve the requirements of this specification to assume compliance to all regulatory agencies and also to ensure the work is completed in a manner consistent with the Agent's standards of Customer satisfaction. The Contractor at no cost to the Agent will perform rework of pruning within 5 working days of notification unless otherwise agreed to with the Agent's Line Clearance Supervisor.

12.0 Work Zone Traffic Control

If work activity is on or near a road adequate traffic control must be maintained to protect the safety of the public and the Contractor's personnel. The Contractor and their subcontractors will comply with all applicable parts of the most current US Department of Transportation's Manual on Uniform Traffic Control Devices (MUTCD). If working in areas covered by state permits issued to the Agent, Contractors are required to comply with the provisions (work practices and notifications) of permit language.

13.0 Equipment and Vehicles

- 13.1 Equipment and vehicles shall be professional in appearance and in good working condition.
- 13.2 Trucks shall display "PSEG LONG ISLAND LINE CLEARANCE CONTRACTOR" signs.
- 13.3 Fueling and maintenance of vehicles and equipment shall be performed on Contractor's time. The Agent shall not be billed for time and material involved.
- 13.4 The Contractor shall provide a list of aerial lifts that could reasonably be expected to work on Company's territory inclusive of the truck number and date of dielectric testing and the next scheduled dielectric test date.
- 13.5 Typical equipment to be furnished is shown below:
 - Lift (bucket) truck – 55' – 70' reach – Agent's Line Clearance Supervisor to determine complement of trucks
 - Chipper (trailer type) – Disc / Drum minimum blade 12"
 - Large Chain Saw – 36" – for tree removal
 - One man crew – pick up with Smart Phone
 - General Foreman's vehicle (car/pickup) with GPS and Smart Phone
 - Appropriate equipment for site clean up
- 13.6 Trucks shall contain a minimum of two handheld lights rechargeable from the truck. The lights shall be suitable of intended purpose and of sufficient candle power to enable safe working conditions at night and other low light conditions.
- 13.7 Contractor equipment rates shall include, but are not limited to, the equipment listed in Attachment "A". Each vehicle shall carry a copy of "Best Management Practices – Utility Pruning of Trees" available from the International Society of Arboriculture. These requirements are applicable to Contractor equipment being utilized under this contract.

14.0 Parking & Equipment Storage for Duration of Project

- 14.1 Parking of all Contractor equipment and employees vehicles will be the responsibility of the Contractor. Parking at the Company's facilities may be permitted depending on available space.
- 14.2 Contractor vehicles, equipment, or employee vehicles stored or parked on Company's property will be stored or parked at the owner's risk. Company and/or the Agent are held harmless as to the security of such vehicles or equipment.

15.0 Safety Equipment

- 15.1 All Contractor personnel are required to wear hard hats and safety glasses while on a job site in addition to other personal protective equipment (PPE) appropriate to the work. Contractor is responsible for providing hearing protection as required or deemed necessary.
- 15.2 For work along roads and other areas of vehicular traffic, Contractors shall wear high visibility clothing or vest with reflective striping.
- 15.3 Forestry Contractors shall wear chaps while operating a chainsaw or when assisting and/or working in close proximity to a chainsaw that is being operated.

16.0 Safety

- 16.1 All Contractors are required to comply with the requirements of the Occupational Safety Administration (OSHA), all other applicable federal, state, and local laws, ordinances, regulations, and other project and site specific permits unless superseded by Agent's procedures.
- 16.2 The Agent evaluates Contractor compliance by conducting routine site visits and field safety visits.
- 16.3 If a safety violation is observed by an Agent's representative, the violation will be discussed with the Contractor at the time of discovery.
- 16.4 The Contractor must implement corrective actions and establish measures to prevent a recurrence through Incident Analysis (IA) process.
- 16.5 Individual Contractor personnel who habitually violate safety rules should be identified, and the Contractor should remove the individual(s) from the project. The Agent reserves the right to remove any Contractor employee(s) who violate or pose a safety risk to themselves, Agent employees, or the general public.
- 16.6 The Agent documents safety by completing a "Contractor Performance Evaluation". Safety performance will be used in the decision process for awarding future contacts.
- 16.7 Any personnel injury must be reported to the Agent in the same day. Injury investigation process will follow.
- 16.8 The Contractor shall furnish incident reports in duplicate for all events that result in damage to the property of others, including the Agent.

17.0 Personnel & Conduct

- 17.1 Contractor shall make available at the Agent's request the job qualifications of persons assigned to perform this work.
- 17.2 All work shall be performed by personnel trained, supervised, and equipped in accordance with latest revision of ANSI Z133.1, DOT Regulations, OSHA 1910.269, all other applicable Federal, State, and Local Regulations and the Agent's "Rules for Safe Operation."
- 17.3 The Agent shall not be charged for the labor or equipment costs incurred when Contractor personnel are idle due to equipment breakdown.
- 17.4 All Contractor employees engaged in the work shall maintain a professional appearance consistent with the work being performed and shall carry individual identification badges, which must be shown to Customers upon request.
- 17.5 The Contractor shall employ a competent field supervisor who is to be available to the Agent at all reasonable times during the extent of the project and/or contract.
- 17.6 The Contractor shall maintain field and supervisory personnel who will address questions and complaints from neighboring residents in a clear, prompt, professional and courteous manner.
- 17.7 The Contractor's work crews are required to have communications with the Contractor's office and Field Supervisor at all times.

18.0 Customer Sensitivity

- 18.1 The work shall be conducted with the highest degree of concern for Customer sensitivity. Crew members must be attired in a professional manner consistent with the work being performed.
- 18.2 The Contractor shall notify the owner of their intention to trim prior to entering and trimming on private property.
- 18.3 All Contractor employees must attend annual line clearance contractor training including safety, proper pruning, and customer satisfaction.
- 18.4 It is understood that extreme care shall be taken to ensure that no damage is done to Customer property. The Contractor must take precautions to protect adjoining facilities or structures from the work. In the event any damage occurs to private or public property (including Company facilities), the Contractor is responsible for all costs associated with the repair of any damage. The Agent may conduct repair efforts and costs will be back charged to the Contractor including an appropriate charge by the Agent for administration and overhead.
- 18.5 The Contractor shall exercise its best effort to avoid and be responsible for resolving disputes with property/business owners, highway, or other authorities. The Contractor shall report to the Agent's Line Clearance Supervisor Customer objections concerning the "work" that the Contractor is unable resolve to the Customer's satisfaction.

19.0 Crew Reporting & Customer Notification

- 19.1 The contractor shall report the work locations and work completions of his crews on a daily basis.
- 19.2 The Contractor will be expected to notify the Customer of its intention to trim before entering and trimming on private property. If the Customer is not at home the Contractor may proceed to perform the work.
- 19.3 The Contractor shall notify the Agent's Line Clearance Supervisor of failure to obtain standard clearance.
- 19.4 Prior to any tree removals, the Contractor is required to obtain the authorization of the Agent's Line Clearance Supervisor and secure written permission from the property owner.
- 19.5 Customer permission is not required for an imminent hazard tree/ emergency situation that threatens the soundness of the electric distribution system or the safety of the persons in the surrounding area. Contractor must obtain direction/ approval from Agent's Line Clearance Supervisor/ Manager or Electric Service personnel that the hazard tree is an emergency situation prior to removing.

20.0 Key Performance Indicators

Key Performance indicators (KPI's) will be utilized to measure contractor performance and in the decision process for awarding future contracts.

EQUIPMENT REQUIREMENTS**Attachment "A"****A. EACH CREW MEMBER**

- 1 NG PSEG-LI Tenant badge and 1 PSEG-LI Contractor badge
- 1 Climbing belt
- 1 Safety Strap
- 1 Handsaw with scabbard
- 1 120 ft. climbing rope with snap
- 1 Helmet with PSEG-LI sticker, safety glasses, safety vest, gloves and ear plugs

B. SPLIT BODY DUMP TRUCK

- | | |
|---|---|
| 2 - 24 ft. wood extension ladders | 1 Street broom |
| 1 - 16 ft. pole saw | 1 Shovel |
| 1 - 16 ft. pole clip | 1 Lawn rake |
| 3 - 12 ft. pole saws | 2 Leaf blowers |
| 3 - 12 ft. pole clips | 2 "Men Working" signs |
| 2 - 120 ft. hand lines | 1 Set stop/slow paddle signs |
| 1 - 150 ft. bull rope | 10 Orange reflective traffic cones |
| 3 Chain saws, 14, 18, 24" | 1 First Aid Kit |
| 1 Portable gas powered pole chain saw (PC) | 1 Fire extinguisher |
| 2 Rechargeable portable flood lights | 1 - 5 gallon cooler |
| 2 Sets climbing hooks | 1 Pair of chaps |
| 1 Copy of Hagstrom book maps for Nassau & Suffolk | 1 - 2.5 gallon gas can with proper holder/tie down for D.O.T. requirements |
| 1 GPS | 1 Tool box, equipped w/ files, chainsaw wrench, adj. wrench, hammer, screwdrivers, pliers |
| 1 Smart Phone | |

C. BUCKET TRUCK

1 - 24 ft. wood extension ladder	1 Street broom
1 - 16 ft. pole saw	1 Shovel
1 - 16ft. pole clip	1 Lawn rake
1 - 12 ft. pole saws	2 Leaf blowers
1 - 12 ft. pole clip	2 "Men Working" signs
2 - 120 ft. hand lines	1 Set stop/slow paddle signs
1 - 150 ft. bull rope	10 orange reflective traffic cones
3 Chain saws, 14, 18, 24"	1 First Aid kit
1 Portable gas powered pole chain saw (PC)	1 - 5 gallon cooler
1 Hydraulic pole chain saw	1 Pair of chaps
2 Rechargeable portable flood lights	1 - 2.5 gallon gas can with proper holder/tie down for D.O.T. requirements
2 Sets climbing hooks	1 Fire extinguisher
1 Copy of Hagstrom book maps for Nassau & Suffolk	1 Tool box, equipped w/ files, chainsaw wrench, adj. wrench, hammer, screwdrivers, pliers
1 GPS	
1 Smart Phone	

D. ONE PERSON CREW PICKUP TRUCK (pick-up with locking cap)

2 Chain saws 14" and 18"	1 Leaf blower
1 Gas powered pole saw	1 Lawn rake
3 - 6 ft. collapsible pole extensions with clip, hanger puller and pole saw attachments	1 Street broom
1 - 120 ft. hand line	1 Shovel
2 Rechargeable Portable Flood Lights	1 Tool box, equipped w/ chainsaw wrench, adj. wrench, hammer, screwdrivers, pliers, files
1 Copy of Hagstrom book maps for Nassau & Suffolk	1 Pair of chaps
1 GPS	1 Set stop/slow paddle signs
1 Smart Phone	1 First Aid Kit
1 - 2.5 gallon gas can with proper holder/tie down for D.O.T. requirements	1 Fire extinguisher
	1 - 5 gallon cooler

PSEG Long Island
Case Name: PSEG LI - Rate Case 2015
Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-TDP-0394
Date of Response: 04/20/2015
Witness: TD BUDGET AND OPERATIONS

Question:

Exhibit_(TDP-1), page 4 of 6, shows that the Company proposes to spend \$900,000 per year for additional maintenance and system analysis as a result of the new BES definition. Fully explain what additional maintenance and system analysis would be conducted as a result of the new BES definition.

Attachments Provided Herewith: 0

Response:

There is an urgent need for new staffing resources to address new regulatory compliance requirements associated with the North American Electric Reliability Corporation's ("NERC") adoption of "bright line criteria" of 100 kV and above for the Bulk Electric System ("BES"). This change brings into scope for mandatory NERC compliance LIPA's 138 kV system. The revised BES definition has a significant impact on LIPA resulting in the need to comply with extensive NERC requirements. In addition, NYISO had communicated that NYISO will not undertake a registration model like PJM where PJM accepts such compliance responsibility and reporting requirements. As a result, LIPA will need to register as a Transmission Planner ("TP") and Transmission Operator ("TOP") with significant compliance responsibilities for these additional requirements. Since this is a new undertaking, an effective compliance infrastructure tailored towards the new requirements needs to be established which requires staff augmentation.

As previously noted, LIPA, must register as a TP and assume significant compliance responsibilities associated with numerous reliability standards which have extensive study and documentation requirements to demonstrate compliance. LIPA will be regularly audited on compliance with these new obligations. The following lists some of the incremental responsibilities to comply with applicable NERC Reliability Standards for various T&D organizations.

- 1) Transmission Planner compliance responsibilities:
 - a. Annual Transmission Planner Assessments for 2 year, 5 year and 10 year cycles to support NERC TPL standard requirements including but not limited to N-1-1 analysis, simulation of contingencies with known system outages, simulation of relay loadability limits and extreme contingency analysis.
 - b. Sensitivity analyses to the annual transmission planner assessment mentioned above as required by NERC Standard TPL-001-4.
 - c. Dynamic stability analysis to support selection of dynamic contingencies.
 - d. Annual Short Circuit Analysis for near term planning horizon.

- e. Study, propose and document corrective actions for TPL violations (these corrective actions need to be coordinated with neighboring TOs and ISOs if neighboring TOs are impacted).
- f. Annual evaluation, establishment and documentation of system operating limits ("SOL") as per the FAC-014 standard in the planning horizon which is the thermal transfer analysis, voltage transfer analysis and stability transfer analysis for four internal interfaces.
- g. Coordination and communication of studies with NYISO and adjacent TPs such as Consolidated Edison.
- h. Documentation of study reports tailored towards the compliance requirements so that the compliance infrastructure is set up for on-site, off-site or spot audits.
- i. Development and documentation of Reliability Audit Worksheets ("RSAWs") for each applicable reliability standard.
- j. Support the upcoming new Geomagnetic Disturbance standard where there is a requirement to conduct vulnerability assessment of the near term transmission planning horizon once every 60 months.

2) Planning support for cross functional compliance responsibilities:

- a. Incremental work load in identifying and establishing operational system operating limits to support TOP standard requirements.
- b. Documentation and modification of seasonal operating studies as compliance evidence for operational requirements.
- c. Completion of RSAWs for applicable TOP standards for the areas where planning studies are utilized.
- d. Conduct studies to support protection standards such as PRC-002-2, PRC-023-3 and other standards such NERC Critical Infrastructure Protection ("CIP").
- e. Coordination and communication of studies with cross functional organizations for compliance.

3) Transmission Operator compliance responsibilities:

- a. Track and maintain compliance with 200+ NERC Reliability Standards' requirements.
- b. Manage a process to continually review requirements and prepare RSAWs associated with applicable Reliability Standards.
- c. Travel to attend NYISO Bulk Electric System/Transmission Operator monthly meetings.
- d. Consultant support for NERC compliant Operator training program design.
- e. System Operator Training and annual task certification requirements on a recurring basis.
- f. Maintain Transmission Operator NERC Certification credentials.
- g. Procure software solutions for managing certified operator training program, in an auditable NERC compliant manner. The software solution has a recurring annual cost with annual increases after initial licensing and setup fees.
- h. Document management support to maintain and control documents and procedures used to demonstrate compliance (change tracking, review cycles, etc.).

- i. Prepare for and respond to NERC operations and CIP audits. The Transmission Operator audit cycle is three years compared to the six year audit cycle for LIPA's current registration.

4) Protection & Engineering related compliance responsibilities:

- a. Perform studies for system protection coordination with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.
- b. Determine required Disturbance Monitoring points to ensure that adequate disturbance data is available to facilitate Bulk Electric System event analyses.
- c. Analyze Disturbance Monitoring data for events occurring during the reporting period.
- d. Determine Transmission and Generator Relay Loadability to prevent unnecessary tripping of generators during a system disturbance.
- e. Assist Transmission Operations to develop NERC/CIP documentation for critical facilities.
- f. Validate rating and methodology with neighboring utilities.
- g. Research and validate requirements and rating methodology for 138kV OH and UG circuits.
- h. Assist Transmission Operations on inventory of circuits for NERC compliance data requests.
- i. Determine overload ratings and associated methodology for 345kV and 138kV transformers.
- j. Determine overload ratings and associated methodology for GSUs associated with NERC generators.
- k. Determine overload ratings for all substation components (i.e., bus, switches, breakers, etc...) rated 100kV or higher. Periodically review industry standards and their applicability to the various BES components.
- l. Maintain the NERC associated data, the self-certification of compliance with the required standards, and participation in NERC workshops, meetings, and audits and data analysis of events occurring during the reporting period.
- m. Comply with System Protection Coordination (in drafting phase).
- n. Perform joint Planning and Engineering analysis on a per-BES-element basis in all BES substations for relay and communication redundancy and separation requirements.

5) Incremental Preventive Maintenance BES compliance responsibilities:

The preventive maintenance increase associated with NERC BES will require additional testing, documentation and test guidelines for the following BES element protection relay system types:

- a. Relay communication systems associated with transmission line protection
- b. DFR/SER equipment
- c. Transformer sudden pressure relays
- d. Re-closure line protection equipment

In summary, PSEG LI T&D organizations will become responsible for numerous Reliability Standards which, among other things, will impose extensive study, documentation, maintenance and testing requirements to demonstrate compliance.

PSEG Long Island
Case Name: PSEG LI - Rate Case 2015
Docket No(s): Matter No. 15-00262

Response to Discovery Request: DPS-TDP-0444
Date of Response: 04/24/2015
Witness: TD BUDGET AND OPERATIONS

Question:

- a. Reference Exhibit_(TDP-1), page 4 of 6. Provide a breakdown of the incremental staffing level by title and salary that accounts for the incremental \$900,000 per year spending on Bulk Power Definition.
- b. For each title listed in response to question 1 above, provide the historic staffing level for 2012, 2013 and 2014.
- c. Indicate which responsibilities listed in the Company's response to DPS-TDP-0394 are performed by current staff.
- d. Response to DPS-TDP-0157 indicates that the \$900,000 is contained in the Non-labor category under T&D Asset Management in Exhibit_(TDP-1), page 1 of 6. What is the reason for reflecting the expense there?

Attachments Provided Herewith: 1
DPSTDP444.xlsx

Response:

- a-c) The BES work is incremental work required to be performed to support implementation of the new BES definition. It is work not currently performed. Detail was provided in work papers submitted by finance. Excerpts from the submitted work papers are shown on attachment DPSTDP444.xlsx
- d) The adjustment of \$900,000 was incorrectly categorized as non-labor. It should have been growth of \$2,157,000 in labor, and normalization of labor (-628,500) and non-labor (-628,500). The net adjustment is \$1,528,500 labor and (-628,500) non labor.

Transmission and Distribution
2015 Approved Budget - Forecast 2016, 2017 and 2018

PSEG Long Island Business Unit	2015 Approved	2016 Forecast	2017 Forecast	2018 Forecast	2016 % Change	2017 % Change	2018 % Change	Justification/OSA Target

Regarding BES, the budget had 3 FTE's and the remaining amount contractors. Our responsibilities across most of T&D is increasing. The impact of the new BES definition is as follows:

75 additional circuits
42 additional elements such as transformers/PARs/shunts/reactive elements
213 additional requirements
42 additional standards

The new BES definition us in various aspects.

1. Documentation and records management for compliance
2. Costs associated with TOP compliance as a result of new BES definition and increased scope of work due to the increment in the number of BES elements
3. Costs associated with periodical self-audits, self-certifications, preparation of RSAW and audit responses
4. Costs associated with data retention
5. Costs associated with mandatory training requirements and certifications

The new BES definition introduces 119 additional BES elements (75 circuits and additional transformers/PARS/ reactive resources)
Transmission operations would be subject to 42 additional standards totaling into nearly 213 additional requirements.

The impact to the operation will be greater than \$900,000 but we plan on finding savings to account for amounts over that.
