1 INTRODUCTION

1.1 BACKGROUND

Stonewall Solar, LLC (Stonewall Solar) is proposing to construct and operate the Stonewall Solar Project (Facility Site), an alternating current photovoltaic facility. The Facility Site is in the town of Meredith, Delaware County, New York (see Figure 1-1). Facilities proposed within the Facility Site include solar arrays and other features, including pad-mounted inverter/transformers, an interconnection area, perimeter security fences, and access roads.

WSP USA Inc. (WSP) conducted breeding bird surveys at the Facility Site from May 19, 2022, to July 16, 2022. An avian study plan was submitted to the Office of Renewable Energy Siting (ORES) in compliance with 19 New York Codes, Rules and Regulations § 900-1.3(g)(4) on March 8, 2022 (WSP 2022). ORES reviewed the avian study plan, which was prepared to be consistent with the New York State Department of Environmental Conservation (NYSDEC) *Survey Protocol for State-listed Breeding Grassland Bird Species* (NYSDEC 2022a). ORES provided comments to the 2022 breeding bird study plan on April 28, 2022. WSP provided a response to comments via email to ORES on May 19, 2022.

The objectives of the breeding bird surveys were to:

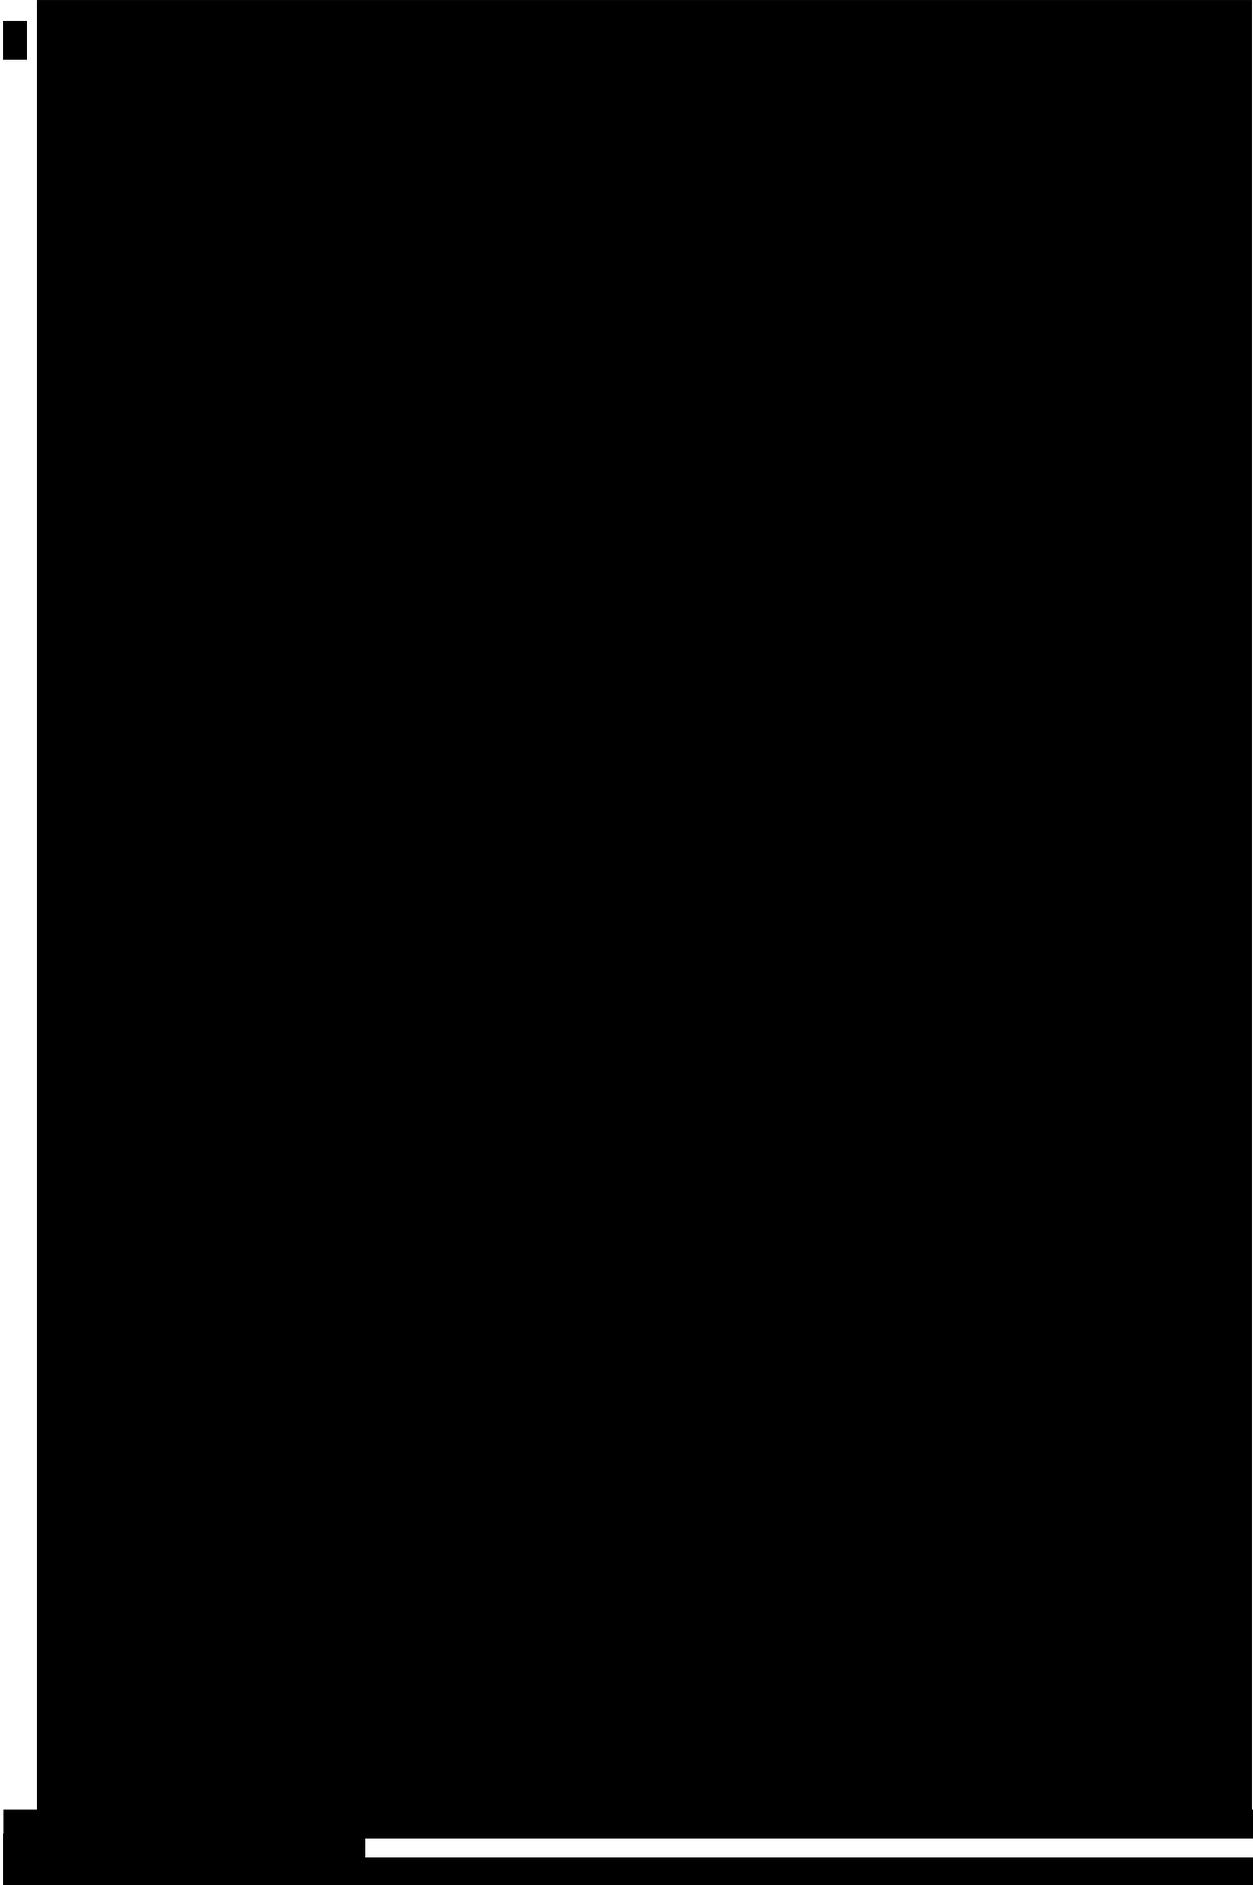

1. Collect information on the species richness and abundance of breeding grassland bird species in the Facility Site;
2. Document particular areas used by state-listed grassland bird species in the Facility Site;
3. Report the baseline data resulting from surveys; and
4. While it is not a direct objective of the survey or the report, it is understood that the data will be used to review whether suitable or occupied habitat for bird species listed as threatened or endangered by New York State or the U.S. Fish and Wildlife Service is identified within the Facility Site as part of the ORES 94-c application process.

The methodology and results of the 2022 breeding bird survey effort are summarized in this report.

1.2 STUDY AREA

The current Facility Site encompasses approximately 1,622 acres in Delaware County, New York. Figure 1-1 depicts the boundaries of the Facility Site at the time of the study and the land cover types within the proposed parcels. The elevation at the Facility Site is approximately 2,175 feet (663 meters) above sea level. Based on data from the 2019 National Land Cover Database, most of the land cover within the proposed parcels is composed of deciduous forest and hay/pasture (44 percent and 43 percent, respectively) (USGS 2019). Other land cover types throughout the Facility Site include mixed forest (5 percent), woody wetlands (3 percent), and developed/open space (2 percent). Site reconnaissance is consistent with the 2019 National Land Cover Database dataset.

2 METHODS

The primary focus of the pre-construction breeding bird surveys was to determine the presence and site use by New York State-listed threatened and endangered grassland bird species during the breeding season (see Table 2-1). The breeding bird survey is part of the pre-application review by ORES in compliance with 19 New York Codes, Rules and Regulations § 900-1.3(g)(4).

2.1 STUDY DESIGN

A total of 40-point count locations were established in areas of suitable grassland within Facility parcels at the Facility Site. The number of point count locations was determined per accessible parcel by placing a point for every 25 acres (10 hectares) of suitable grassland habitat. A minimum distance of 250 meters (820 feet) in all directions was provided between point counts and point count locations were placed to cover open habitat throughout the entire Facility Site. The study encompassed habitats that are generally representative of the area to be affected by development plans (i.e., pasture/hayfield). Figure 2-1 presents a map of breeding bird survey locations and viewsheds within the 100-meter (328-foot) survey radius. These points were surveyed during eight morning survey periods between May 19 and July 16, 2022.

2.2 FIELD METHODS

2.2.1 SITE CHARACTERIZATION

Survey methods for site characterization at each point count location were established in accordance with the NYSDEC *Survey Protocol for State-listed Breeding Grassland Bird Species* (NYSDEC 2022a).

Site description information was collected separately and included habitat type, management practices (e.g., timing of hayfield mowing), distance from the nearest road, distance from hedgerow or forest, distance to nearest shrub, and vegetation measurements in a 25-meter (82-foot) radius from the survey point. Vegetation measurements included percent cover of each

vegetation type (i.e., grass, forb, woody, and bare ground), dominant grass and dominant forb, and litter depth. A Robel pole was used to measure vegetation height and density from four cardinal directions and then averaged. The presence of invasive plant species was also recorded.

2.2.2 BIRD SURVEYS

Survey methods to assess breeding grassland bird use and distribution at the Facility Site were established in accordance with the study plan (WSP 2022).

At each point count location, the avian biologist surveyed for a period of 5 minutes after an initial 1 to 2 minutes of silence following their arrival at the survey point to allow birds to recover from any disturbance. Birds observed or heard within approximately 100 meters (328 feet) were recorded. Surveys were conducted between one-half hour before sunrise until no later than 10:30 a.m. Morning surveys were conducted at each point count location once per survey period with approximately one week between surveys. Surveys were not conducted during inclement weather (e.g., rain) or on days with strong winds (i.e., greater than 12 miles per hour).

[REDACTED]
Facility Site; therefore, evening surveys were not conducted.

The surveyor recorded the following data at each point count station: start and end time for each survey; weather information (i.e., temperature, wind speed, wind direction, and cloud cover); a note on habitat (e.g., whether recently mowed and approximate grass height); species identification; number of individuals per species within 100 meters; how the species was detected (visual or auditory); breeding behavior (e.g., carrying food or nest material, courtship behavior, territorial defense, singing) using New York Breeding Bird Atlas breeding codes (NYSDEC 2022b); and any additional pertinent notes. Birds detected over 100 meters from the observer, between survey points during the meander survey, and flyover species were recorded in separate columns than birds detected within 100 meters.

For any federally and/or state-listed threatened or endangered species documented at the Facility Site (including incidental observations), the following information was recorded: date, time, behavior observed, perch locations, potential or confirmed nest locations, foraging areas, flight paths, and flight height mapped on aerial photographs.

2.3 DATA ANALYSIS

Following each survey day, data were entered for future analysis into an Excel spreadsheet. Prior to any analysis, the data were checked for accuracy and completeness.

Data were analyzed from each point count location using species richness and relative abundance as a baseline analysis for the area. Abundance was calculated as the number of observations for each species and the total for the entire survey. Species composition was generated as a list of species observed, while species diversity was the number of species identified by point count location for the entire survey period. Relative abundance was calculated as the proportion of the number of each species relative to total bird observations for the survey period (birds per survey location). Species frequency was calculated as the percentage of surveys in which each species was identified.

Spatial use was investigated by comparing the abundance and species diversity by location. Abundance of each species was also grouped by point count survey location and by survey period.

2.4 INCIDENTAL OBSERVATIONS

Incidental observations included bird species that were observed or heard either outside the 100-meter survey radius from the survey point, as flyover detections, or while walking between points or to and from the surveyor's vehicle. The surveyor recorded the species and number for these incidental bird observations, provided such observations did not detract from the detection of birds within the 100-meter survey radius. Consistent with the NYSDEC protocol, detailed information on incidental observations of threatened and endangered species are included in this report. The incidental data was not used in the final quantitative analysis.

2.5 SPECIES OF CONCERN

All federally and/or state-listed threatened and endangered species and species of special concern were identified and recorded, along with their listing status, number observed, survey point, approximate location and/or flight path, and date and time observed.

Shapefiles of point count survey locations and any detections of all federally and/or state-listed threatened and endangered species were provided separately.

2.6 WEATHER CONDITIONS

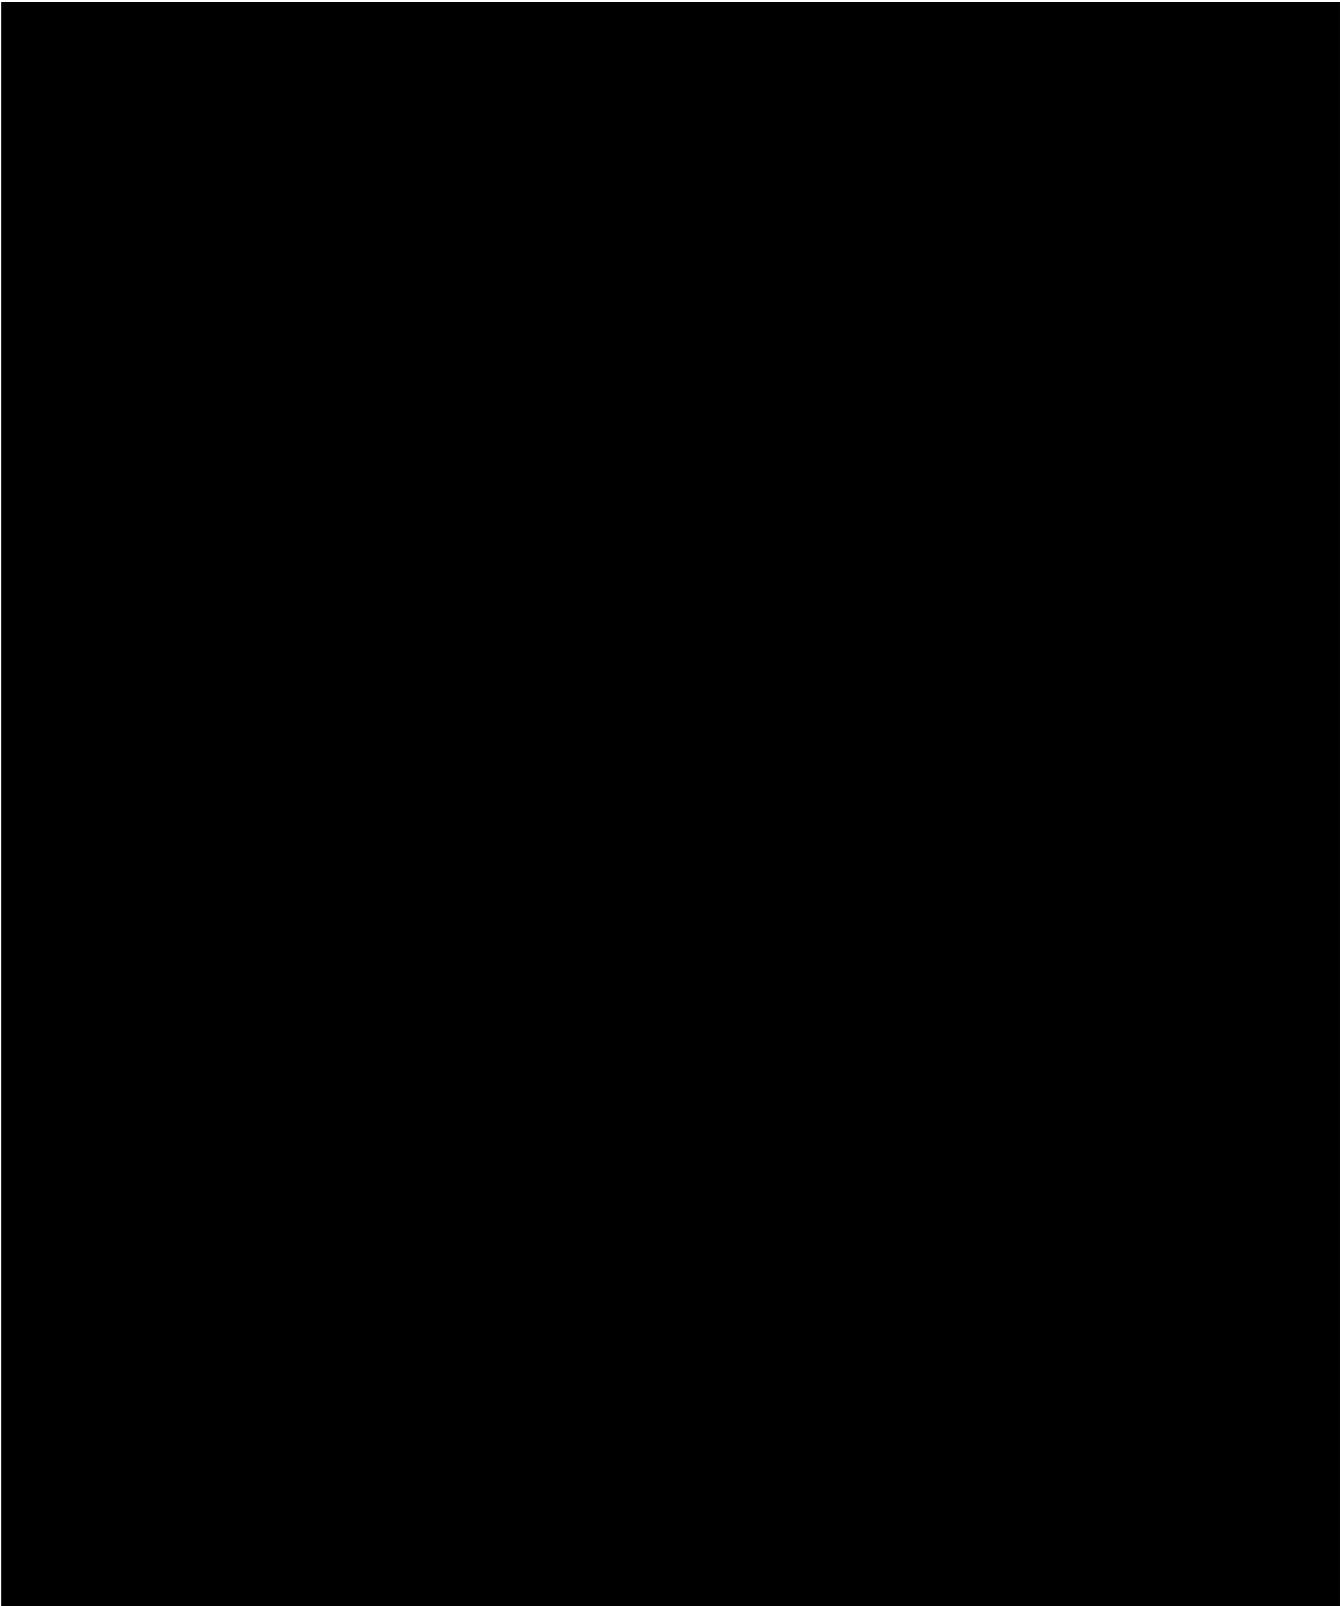

Surveys were completed during appropriate weather conditions to allow target species to be detected. Surveys were not conducted during periods of precipitation, fog, or moderate to strong winds (i.e., wind speeds greater than 12 miles per hour).

Weather data, including temperature, cloud cover, and wind speed and direction were recorded at the start of each survey. Temperature was measured with a car thermometer or the Wunderground weather application. Wind speed and wind direction were recorded using the Wunderground application. Cloud cover was estimated by the surveyor before starting the survey at each point.

2.7 QUALITY ASSURANCE AND QUALITY CONTROL

Field staff were responsible for reviewing their data forms for completeness, accuracy, and legibility at the end of each survey date. The data were regularly reviewed by the project manager for quality assurance. Irregular or potentially questionable data were flagged and discussed with field personnel.

3 RESULTS

3.1 SURVEY DATA OVERVIEW

A total of 320-point count surveys (26.67 hours of survey effort) were conducted from May 19 through July 16, 2022, during which 2,457 detections of 58 species were recorded within the 100-meter survey radius from each survey point. Each point was surveyed eight times across eight survey periods during the field survey. Survey dates are provided in Table 3-1.

The full dataset of species, number counts, locations, dates, times, stationary versus incidental detections, and breeding codes are recorded for bird observations during all surveys and are presented in Appendix A. It is noted that entering reportable data into the New York State Breeding Bird Atlas via eBird is an optional data management tool. However, Stonewall Solar prefers to not enter the data into eBird at this time.

Table 3-1 Dates of Survey Periods during the Field Survey at Stonewall Solar Project in 2022

Survey Period	Dates	Number of Points Surveyed
1	5/19, 5/20, 5/21	40
2	5/24, 5/25	40
3	6/5, 6/6, 6/7	40
4	6/12, 6/14	40
5	6/19, 6/20	40
6	6/29, 6/30	40
7	7/5, 7/8	40
8	7/13, 7/16	40

3.2 SITE CHARACTERIZATION DATA

Out of the 40 survey points, 31 were classified as hay field, four were classified as pasture, one was classified as hayfield/pasture, one was classified as wet meadow/wooded, one was classified as wet meadow, one was classified as old field, and one was classified as swampy/hayfield (see Table 3-2). Survey points were dominated by a mix of grass species including orchardgrass (*Dactylis glomerata*; 18 points) and timothy grass (*Phleum pratense*; 17 points), as well as forbs including goldenrod (*Solidago* spp.; three points) true sedge (*Carex* sp.; one point), and spike sedge (*Carex spicata*; one point). Site characterization data are presented in Appendix B. Representative photos of survey points are presented in Appendix C.

Table 3-2 Vegetation Types at Each Survey Point for Stonewall Solar Project in 2022

Point	Vegetation Type	Dominant Plant	Average Vegetation Height (centimeters) ¹	Date Measured	Time of Mowing

B39	Hay Field	Orchardgrass	10.0	7/5/2022	Mowed after period 2
B40	Hay Field/Pasture	Timothy	6.3	7/5/2022	3/4 mowed after period 2, northeast 1/4 unmanaged for duration of field survey

Notes:

¹ Average of Robel pole measurements taken in four cardinal directions around the center point.

Vegetation height was measured using a Robel pole and averaged 27 centimeters (cm) overall for the 33 survey points with hay field habitat at the point center (including the one hay/pasture point and one swampy hay field point), was 20 cm for the four points with pasture habitat at the center, was 55 cm for the one point with old field habitat, and averaged 40 cm for the two wet meadow points (including one wet meadow/wooded point). Percent vegetation cover was high at all points, with at least 95 percent vegetative cover or above at all 40 points. Litter depth was moderate overall and averaged 2.4 cm for the 43 survey points with hayfield habitat at the point center, was 3.0 cm for the four points with pasture habitat at the center, was 3.0 cm for the one point with old field habitat and averaged 2.5 cm for the two wet meadow points.

Timing of mowing varied by survey point (see Table 3-2). 15 of the 40 survey points (37.5 percent) were not mowed (unmanaged) for the entirety of the field survey. 18 of the points (45 percent) were mowed before the fourth survey period was completed. Seven points (17.5 percent) were mowed after the fourth survey period. In addition, four survey points had active cow grazing, where grazing impacts gradually accumulated over the course of the field survey.

3.3 ABUNDANCE, SPECIES COMPOSITION, SPECIES DIVERSITY, RELATIVE ABUNDANCE, AND SPECIES FREQUENCY

During the field survey, 2,457 observations of 58 species were recorded within the 100-meter (328-foot) radius point count survey plots. Abundance ranged from one to 742 observations per species, with an overall average of 7.7 observations per survey. The most abundantly observed species were Bobolink (*Dolichonyx oryzivorus*) (742 observations; 30 percent of all bird observations); Savannah Sparrow (*Passerculus sandwichensis*) (438 observations; 18 percent of all bird observations); European Starling (*Sturnus vulgaris*) (269 observations; 11 percent of all bird observations); Red-winged Blackbird (*Agelaius phoeniceus*) (217 observations; 9 percent of all bird observations); and Song Sparrow (*Melospiza melodia*) (180 observations; 7 percent of all bird observations). Together, these five commonly observed species accounted for approximately 75 percent of the total birds detected throughout the survey (see Table 3-3).

The most frequently observed species across all points were Savannah Sparrow (57 percent frequency), Bobolink (39 percent frequency), Song Sparrow (36 percent frequency), Red-winged Blackbird (25 percent frequency), and Barn Swallow (*Hirundo rustica*) (17 percent frequency) (see Table 3-3).

3.4 ABUNDANCE AND SPECIES DIVERSITY BY SURVEY LOCATION

Total species diversity for the eight survey periods ranged from three species (point B39 [hay field]) to 21 species (point B8 [hay field]), with an average of 9.6 species across all points (see Table 3-5). The greatest number of observations per survey by point occurred at points B28 (hay field) and B17 (hay field), which averaged 21.0 and 21.6 observations per survey, respectively (see Table 3-4). The lowest average number of observations per survey by point occurred at point B39 (hay field), which averaged 1.0 observations per survey (see Table 3-4).

Appendix D provides the abundance of each species by survey location and abundance of each species by survey period.

Table 3-4 Survey Results by Point for the Breeding Bird Survey at Stonewall Solar Project from May to July 2022

Point	Vegetation Type	Abundance (Number of Birds Observed in Eight Survey Periods)	Observations per Survey (Average of Eight Survey Periods)	Relative Abundance (%)	Species Diversity (Number of Species Observed in Eight Survey Periods)

Table 3-4 Survey Results by Point for the Breeding Bird Survey at Stonewall Solar Project from May to July 2022

Point	Vegetation Type	Abundance (Number of Birds Observed in Eight Survey Periods)	Observations per Survey (Average of Eight Survey Periods)	Relative Abundance (%)	Species Diversity (Number of Species Observed in Eight Survey Periods)
B32	Hay Field	58	7.3	2.4	4
B33	Pasture	89	11.1	3.6	14
B34	Pasture	77	9.6	3.1	17
B35	Hay Field	54	6.8	2.2	9
B36	Pasture	45	5.6	1.8	16
B37	Hay Field	52	6.5	2.1	4
B38	Hay Field	12	1.5	0.5	5
B39	Hay Field	8	1.0	0.3	3
B40	Hay Field/Pasture	110	13.8	4.5	11
Total		2457	-	100	58
Average		61.4	7.7	-	9.6

3.5 INCIDENTAL OBSERVATIONS

An additional 1,013 observations of 67 species were recorded outside of the 100-meter (328-foot) radius point count plots. An additional 713 observations of 52 species were recorded between survey points. There were 116 flyover detections of 23 species. Of the 84 species observed within the Facility Site, 26 were only observed incidentally. Two state-listed endangered, threatened, or species of special concern were detected outside of the 100-meter point count survey radius; these observations are described in Section 3.7. Data for all incidental observations are included in Appendix E.

3.6 SPECIES CONFIRMED AS LOCAL BREEDERS

Breeding was confirmed at the Facility Site (or near vicinity) for eight bird species, including incidental observations. Bobolink, Red-winged Blackbird, and Savannah Sparrow were the most frequently observed species exhibiting behaviors sufficient to confirm nesting, including adults carrying food or feeding young or the presence of recently fledged young. The other five species confirmed as local breeders include Wild Turkey (*Meleagris gallopavo*), Killdeer (*Charadrius vociferus*), Song Sparrow, Canada Goose (*Branta canadensis*), and Eastern Bluebird (*Sialia sialis*). See notes with field detections in Appendix A.

3.7 SPECIES OF CONCERN

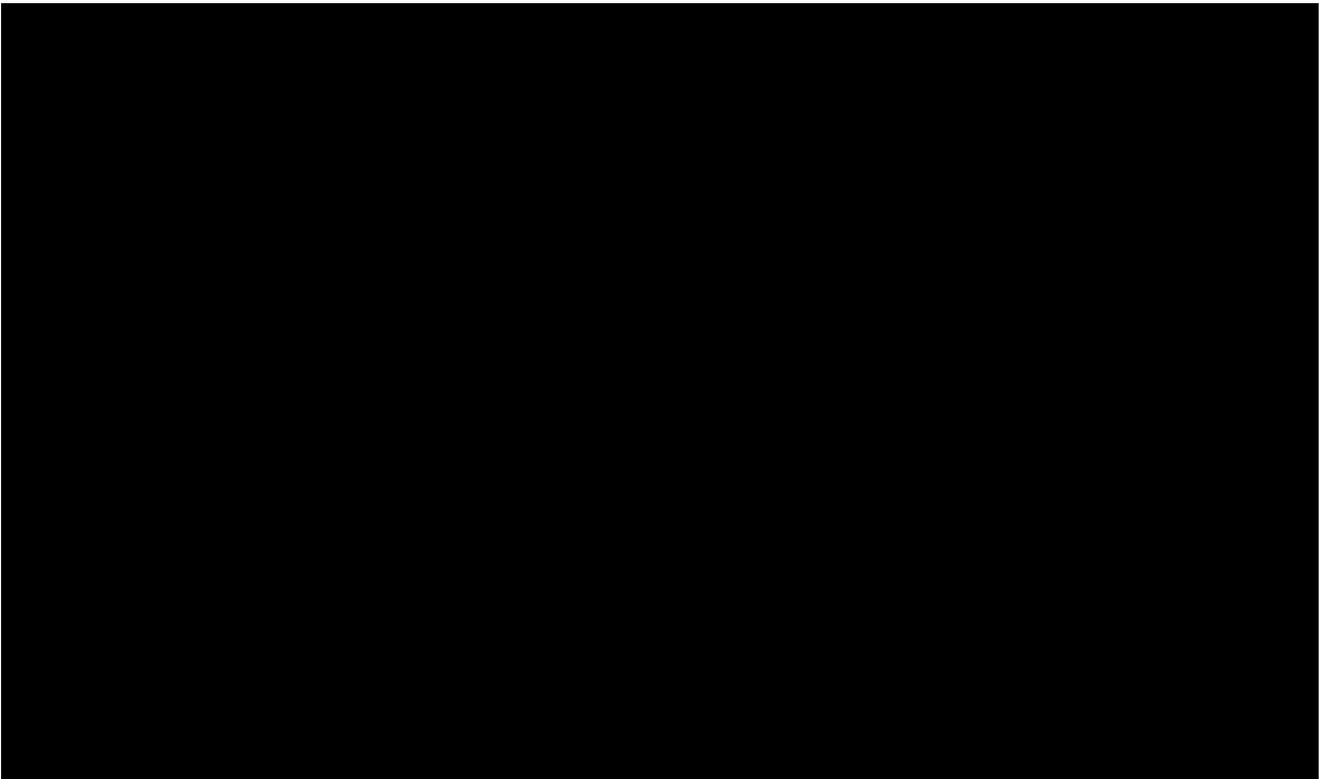

[REDACTED]

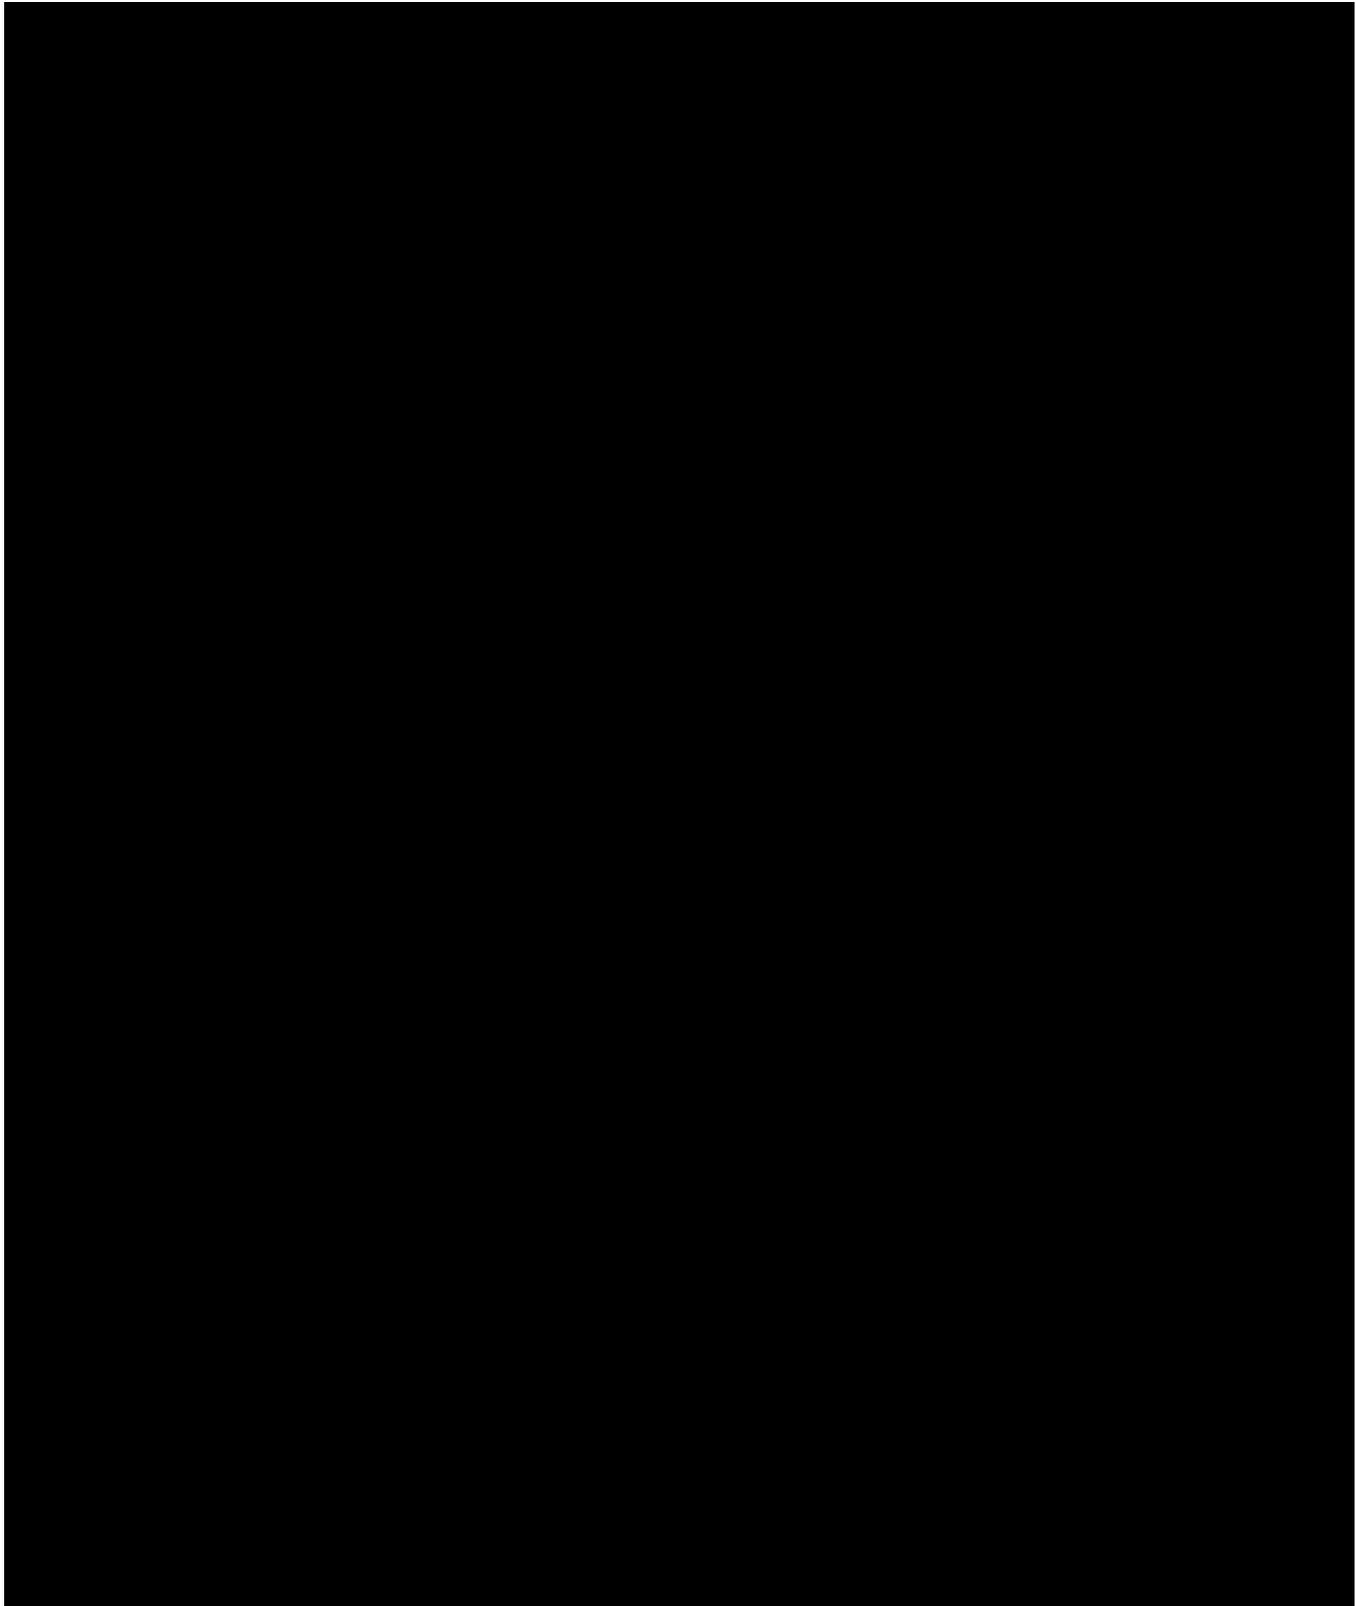

No state-listed endangered species were identified during the breeding bird surveys.

[REDACTED]

Additional details for each of these detections are provided in Appendix A.

[REDACTED]

3.8 WEATHER CONDITIONS AND DISTURBANCES

Weather conditions were conducive to surveying. In general, temperatures slowly rose throughout each survey day, and winds tended to increase throughout each day and varied in direction. On June 19, 2022, wind speed during the last 45 minutes of the survey saw brief periods of higher winds. However, as the higher wind periods were scattered and brief, the surveyor was able to complete surveys for the day. On July 5, 2022, there were two 5- to 8-minute light sprinklings of rain. These brief events had no effect on bird behavior and surveys were completed. Weather conditions during the breeding bird survey period and days prior to surveys are noted in Appendix F.

Distraction or disturbance events did not compromise any of the 5-minute surveys. As noted above, if needed, the surveyor was able to resolve potential instances by waiting for the disturbance or weather event to pass. Inclement weather was not a factor on the eighteen survey dates. Several of the survey points involved entering fields with livestock, which did not impact the surveyor's ability to complete surveys, and there were no interactions with people, potentially dangerous animals, or other potential distractions.

This page left blank intentionally.

4 DISCUSSION

During the field survey, one New York State-listed species of special concern grassland nesting species was observed at the Facility Site: [REDACTED]

[REDACTED] Both birds were observed in appropriate habitat, which indicates possible evidence of local breeding according to the New York Breeding Bird Atlas. [REDACTED]

[REDACTED] No nests were observed for any state-listed species. The location and flight paths of all state-listed threatened and species of special concern are presented on Figure 3-1.

WSP implemented the protocol in the ORES *Survey Protocol for State-Listed Breeding Grassland Bird Species* (NYSDEC 2022a). WSP conducted eight survey periods at the Facility Site (two in May, four in June, and two in July). A total of 40 points were included in the survey, and each point was visited eight times. The approximately weekly surveys at 40 survey points between May 19, 2022, and July 16, 2022, provided thorough coverage of the Facility Site throughout the 2022 breeding season. Therefore, the results of the survey effort suggest that more comprehensive studies are not necessary to adequately assess the potential for the Facility to affect endangered or threatened grassland nesting bird species.

APPENDIX

CONFIDENTIAL

A Full Survey Results

Notes:

The full breeding bird survey dataset uses the data form provided by NYSDEC as part of the 2022 breeding bird survey protocol. The “Number Observed” field for records with “Stationary” entered for Protocol includes all birds recorded during the five-minute surveys. For a given species during a survey this number includes birds within the 100-meter survey radius, outside the 100-meter survey radius, and flyover detections. Records with “Incidental” for Protocol represent birds recorded between survey points.

It is noted that entering reportable data into the New York State Breeding Bird Atlas via eBird is an optional data management tool. However, Stonewall Solar preferred to not enter the data into eBird at this time.

C Photo Log

Photograph 1 – Point B10 facing West. Pasture habitat. A single Bald Eagle flew from a low brushy area inside the 100-meter radius of B10 on May 19, 2022.

Photograph 2 - Point B11 facing East. Old field habitat. Unmanaged during the duration of the field survey.

Photograph 3 – Point B12 facing North. Hay field habitat. A single Cooper’s Hawk was observed outside the 100-meter radius of B12, being chased by multiple songbirds, flying into the nearby woods on July 13, 2022.

Photograph 4 – Point B13 facing West. Hay field habitat. A single Bald Eagle was observed as a flyover species at point B13 on June 5, 2022.

Photograph 5 – Point B14 facing North. Swamp/hayfield habitat. Swamp half of the point is unmanaged while the hay half are mowed regularly.

Photograph 6 – Point B15 facing South. Hay field habitat. A Bald Eagle was observed from point B12 near Point B10, on May 19, 2022. This may have been the same individual that was seen at B10 25 minutes earlier.

Photograph 7 – Point B27 facing South. Hay field habitat.

Photograph 8 – Point B29 facing South. Hay field habitat. A single

Photograph 9 – Point B34 facing North. Pasture habitat. Typical pasture habitat for the Stonewall BBS survey area.

Photograph 10 – Point B35 facing South. Hay field habitat. A single Bald Eagle was observed from B35 in direct flight heading to the northwest at medium height on June 14, 2022.

Photograph 11 – Point B39 facing East. Hay field habitat. Cooper’s Hawk observed at B39, flying southwest through the point July 5, 2022.

Photograph 12 – Point B40 facing North. Hay/pasture habitat. Half of Point B40 consists of hay field while the other half consists of pastureland.
